OBITUARY.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

LAST YEAR.

THAT one year very much resembles another is to a certain extent true, but it is no less true that each succeeding year has a character and an individuality of its own distinctly marked and well defined. The past year was memorable in many respects. It was a year of many great events at home and abroad, which have now passed into history. It comes more within our province to remember, however, that 1867 was the year of the Paris International Exhibition, and a year of many public improvements and beneficial changes in various directions. From the Exhibltion let us hope we derived some valuable lessons. That wonderful display of the world's handicraft taught us at least this—that we require to make up for deficiencies and shortcomings in some things. There are already indications that as a people we have taken this truth to heart, and are turning it to practical account. We allude to the subject of technical education, which has now become a national question, and an important work has been begun among us. Some other movements of a largely beneficial kind have been inaugurated. The investigations that have taken place with regard, for instance, to the working of trades' unions, the management of our workhouses and infirmaries, the sanitary condition of towns, and the causes that affect the public health, are all steps in the right direction, and have contributed to the common weal. We have yet to wait, however, for the complete result and full benefit that may reasonably be expected as the outcome of these and similar investigations. In the matter of public improvements of various kinds, considerable progress has been made. We have recorded from week to week the labours of the architect and the engineer, as well as those of the social science reformer and the art teacher during the past year. Nor is the record a slight one. As regards architecture, we may observe that the year was noteworthy for important, and, let us add, instructive competitions. The New Law Courts competition was, of course, the great architectural event of the year. The designs of the different competitors were fully and impartially criticized and illustrated in the BUILDING NEWS. Next in importance was the National Gallery competition, which also hangs fire. Regarding both, we shall no doubt have something more to say by-and-by. Then there was the several competitions for the Town Halls of Manchester and Grantham, for the London Orphan Asylum; the County Asylum, Derby; the Worcester Orphan Asylum; the new offices for the Board of Works, Poplar; Lutton Corn Exchange; Leicester Clock Tower, and Dorchester Church, and Ryde Church. A fortnight since, we gave the particulars of the Liverpool Labourers' Dwellings competition. The New Public Offices and Vestry Hall at Stratford was the result of a competition, the successful architects being Messrs. Giles and Angell, whose design we gave on December 20th. The Corporation of Great Yarmouth offered prizes for the best design for a terrace of first-class houses, and also for semi-detached villas. In the one case, the premium was won by Mr. J. T. Bottle; in the other, by Mr. Dodds, and both designs appeared in our pages. In the competition for the New Mechanics' Institute, Nottingham, the three premiums were awarded respectively to Mr. Simpson, Messrs. Clarke and Son, and Mr. Sutton. A number of local boards advertised designs for new workhouses and infirmaries, or alterations and additions to existing ones. Some of these have been completed, while others are in progress.

As regards public buildings outside of the metropolis, a first place must be given to Mr. Scott's Preston Town Hall, which last year saw completed. It is thirteenth century Gothic, and one of the best buildings of its kind recently erected. The cost was about £80,000. Rochdale Town Hall, also Gothic, is the design of Mr. W. H. Crossland, of Leeds, and, built at a cost of £30,000, was also completed last year. At a similar outlay, Bradford has erected an exchange in the Venetian Gothic, the architects being Messrs. Lockwood and Mawson. The west wing of the New Exchange, Liverpool, has been opened, and the contracts taken for the other two wings. At Penzance, public buildings, in Italian Renaissance, have been erected by Mr. J. Matthews at a cost of £15,000. Colston Hall, Bristol, by Mr. J. Foster, was recently opened, and report speaks highly of the work, which, however, is not yet finished. The entire cost is set down at something like £40,000. New town halls have also been erected at Walsall by Mr. G. B. Nicholls, of West Bromwich, and at Headcorn by Mr. A. Chambers; and Burnley Town Hall is in course of erection. Petersfield has had a corn exchange, designed by Mr. Chancellor; Llangollen, a court house and assembly rooms, by Messrs. Lloyd; and Shrewsbury, Bacup, Matlock, and Dawley, market halls. The Middlesborough Exchange now in progress is to cost £30,000, and a new cattle market is spoken of for Rochester. Other places are providing for their special wants according as they feel what these are. Thus, at Leeds, a mechanics' institute and school of art has been built—the architect selected was Mr. C. Broderick. The new grand hotel at Scarborough, which has cost nearly a quarter of a million pounds, is also from Mr. Broderick's designs. It is in the Italian style. Literary institutions of a similar kind have been opened at Windsor, Salisbury, and Frome. At Witley, a school (King Edward's) has been erected at a cost of £26,000; and a convalescent hospital at the same place, at a cost of £16,000, from the designs of Mr. S. Smirke, R.A. At Horton Kirby, a home for little boys was completed at a cost of £12,000—Mr. T. C. Clarke, architect. Mr. F. C. Cockerill has given us a grammar school at Highgate, and Messrs. Norton and Masey, an international college near Hounslow; £15,000 has been expended on the portion completed. A Wesleyan theological college was erected at Headingley, near Leeds, and an Independent college at Taunton.

Church building has been extensively engaged in during the year, though the churches, as a rule, are not very remarkable. The following are among the more noticeable:—St. Stephen's, Poplar, in the Second Pointed style, by Messrs. Francis, architects, will cost about £20,000; St. Peter's and St. Paul's, Cork, designed by Messrs. Pugin and Ashlin, at a cost of £24,000; St. Stephen's, Lewisham, in the Late First Pointed style, cost £10,000, Mr. Scott, architect. Mr. R. Plumbe's Congregational Church at Stratford deserves mention for its artistic design, which is Italian. It cost £12,000. Another Congregational church, in the Italian Gothic, was erected at Driffield, at a cost of £15,000, from the design of Mr. H. J. Paull; and a third at Halifax (First Pointed) by Messrs. Ive, at a cost of £9,000. The cathedral church of St. Andrew's, Scotland, by Mr. R. Anderson, of Edinburgh, a commodious and elegant structure, appears among our illustrations for the year. But it would be idle to attempt to enumerate even a tenth part of what has been done in this direction. Each religious body has been "lengthening its cords, and strengthening its stakes," and churches and chapels have sprung up on all sides. It may, however, be added here that a Dominican priory was built at Carisbrook, Isle of Wight, at the expense of the Countess of Clare, the cost being £12,000; and that Messrs. Hadfield and Son, of Sheffield, were the architects of the interesting convent of the Sisters of Notre Dame, erected a short time since at Mount Pleasant, Liverpool. Of this church we also gave an illustration. Considerable progress has also been made with the restoration of the various cathedrals under the direction of Mr. Scott, Mr. Street, and Mr. J. Prichard. The completion of the Chichester tower and spire, by Messrs. Slater and Carpenter, must be noticed among the works completed during 1867.

Most of the improvements within the metropolis were so recently noticed by us that further allusion to them is hardly necessary. In large buildings we have the Metropolitan Meat Market, and the Columbian Market, both of which are advancing rapidly, though as yet far from being completed. Mr. C. A. Long's Town Hall, at Shoreditch, is nearly finished; the Hop and Malt Exchange, which has cost £50,000, the design being Mr. W. H. Moore's, has been opened, and a number of other works are in progress, including the new London University, under the direction of Mr. Pennethorne, at Burlington House, the Record Office, and the New Palace at Westminster, superintended by E. M. Barry. We have had four or five new theatres. Mr. Phipps has converted old St. Martin's Hall, or rebuilt it, into a spacious and elegant playhouse, which has been named the Queen's; the New East London Theatre has been designed by Mr. Hudson; the Holborn Amphitheatre—neat, elegant, and comfortable—by Messrs. Smith and Son; and the New National Standard, which was opened last week. St. George's Hall, Langham-place, has likewise been converted into an opera house by Mr. J. Taylor, architect.

In street architecture we might point to the Belgrave mansions on the Westminster

estate as being at least conspicuous in appearance and bran new, if not designed in the best taste. Skill and labour are equally active in other directions. The Thames Embankment and the Holborn Valley Viaduct are being pushed forward with great energy. It is said that by the end of the present year the new roadway on Holborn will be so far advanced as to admit of traffic. A splendid improvement was effected by the removal of Middle-row, which may be said to be "conspicuous by its absence." It is another satisfaction to be able to record the completion of the main drainage of London. This is certainly a great work fraught with great benefits. Alexandra Park and Palace are well nigh finished, though Southwark and Finsbury Parks still show little inclination to get into shape. Several undertakings of considerable importance are projected, and among them an hospital in London especially devoted to the succour of the resident foreign population. Another hospital is to be erected in Southwark Bridge-road, by Baron Rothschild. A strong effort will also be made this session to get the tramway system introduced into the metropolis. It is proposed to lay down five or six distinct tramways in situations deemed most convenient for passenger traffic.

In the engineering world much likewise has been done. The national dockyards and fortifications at Chatham and Portsmouth are progressing. Some idea may be formed of the magnitude of these works from the fact that something like £8,000,000 will be expended upon them. The docks at Barrow-in-Furness, built for the accommodation of the iron trade lately established there, were opened with great ceremony in August. The Devonshire Dock has a water area of 30 acres, and a depth of 22 feet, with an entrance 60 feet wide. A second dock, to be named after the Duke of Buccleuch, will be 33 acres, and the area of the timber-pond 35½ acres. The wharves adjoining are 100 acres in extent, and the stone quays a mile and a-half in length. The total cost is estimated at £300,000, and the contractors are Messrs. Brassey and Field, the engineers Messrs. M'Lean and Stileman. The progress which South Wales has made during the last twenty years has been something marvellous, in a commercial point of view, and its shipments of coal, iron, and other produce have more than quintupled during that time. At Cardiff, the trustees of the Marquis of Bute have commenced a new dock and low-water pier, which, when completed, will open up a short water communication with the West of England, and steamers will be able to run at all states of the tide from the Welsh to the West of England side. At Llanelly, arrangements are in progress to construct a new dock, and the contract has been already let to Griffiths and Thomas, of Newport. The necessary Parliamentary notices have also been given by the Alexandra Dock Company, Newport, to proceed with their undertaking in sections, and it is expected that early in the spring the first sod will be cut. The first engine and train passed over the Mont Cenis Railway in August. The train was worked on the centre rail system, the summit elevation being 6,700ft. above the sea-level. The railway over the Brenner Pass of the Alps has also been opened. It is understood that Preston is to have additional dock accommodation, at a considerable outlay of money. A promenade pier has been opened at Rhyl, at a cost of £17,000; and another at Weston-super-Mare costing £20,000. This pier stretches from Anchor Head to Birnbeck Island, and is 1,100ft. long and 20ft. wide. The abutments and three of the five piers of the Blackfriars-bridge are completed. The Runcorn bridge over the Mersey (London and North-Western Company) is nearly completed. It is a work of three spans of 300ft. each. Of the Millwall Docks the first section is finished. It comprises a water area of more than 33 acres, with about 2,000 yards of wharf frontage, and a graving dock 413ft. long and 86ft. wide, with an entrance of 65ft. wide. Doubtless we have failed to mention many other undertakings that deserve mention in a record of the year. What we have enumerated, however, will convey some notion of the architectural and engineering labours of 1867. In looking back on them, we may not unreasonably say that should the year on which we have just entered prove as fruitful as its predecessor, it will leave no cause for regret.

HONOUR TO WHOM HONOUR IS DUE.

EVERYBODY we suppose will acknowledge the propriety and rightfulness of the above adage; but unfortunately everybody will not act up to its teaching. Almost everyone can teach by precept, but alas! far too few teach by example. It will be seen that a correspondent in another column to-day calls attention to a subject of some importance to the art life of the nation. The case mentioned by him is not an isolated one. It is, in fact, notorious that the men who design the most reputable works produced in our principal workshops are unknown even to the purchasers of the works themselves. Some men appear to be content to remain in such matters in obscurity; others are more ambitious, and would like to have their names linked with their productions. We are conscious in mooting this question that we tread on delicate, and, in some respects, difficult ground. The present is to all intents and purposes a money-making age. Men sell the workmanship of their hands and the best thoughts of their brain. The highest artistic capabilities are marketable commodities. The capitalist is the master of the age. He wants a design in carpets, in paper hangings, in furniture, or in churches, and there are many ready to supply the want. Who can blame the man of money for buying, or the designer for selling? It is a matter of mutual arrangement between buyer and seller. There is no legislative enactment to compel a man to sell his ideas, or the fruits of his genius. He may attach what conditions to the sale he may think proper. One of the conditions may be that his name may be associated with the thing done, so that he may participate in the credit of doing it. On the other hand, the man of money may sturdily object to this; and as men of brains cannot live as long without food as capital can live without brains, the capitalist being master of the situation, makes his own terms. Much, however, will depend on the custom which prevails in any particular kind of workmanship, and the nature of the work done. A great singer cannot sell the use of his voice without enjoying any popularity which may pertain to its exercise. A great writer or a great artist may, however, sell the use of his pen or his pencil, and remain altogether unknown. In most instances, however, the great writer or artist does make his name known, and his popularity becomes a thing of great value. In fact, almost all writers, whether great or small, attach their names to their works. In the absence of the real name, in some instances a *nom de plume* is substituted; and sometimes, when an author has written more than one book, the second or third book is stated on the title page to be the author of so and so. In this way, some authors, though unknown to fame, enjoy a wide popularity and the marketable value that popularity produces. The same thing applies to the painter, the sculptor, and the musical composer. Why, then, it may be asked, should not a man who designs a buffet or a vase enjoy a similar advantage? He may produce an art gem, but having sold his design to the manufacturer, he is lost sight of. He complains, therefore, and with some justice, that he has not altogether had his deserts. He cannot make a name, and trade on it, as the poet, the dramatist, or the lecturer can. Having gained no vantage ground beyond experience by his preceding efforts, he has got to begin, as it were, anew with every fresh work, and he feels himself placed at a disadvantage. We are not, therefore, surprised at his occasionally grumbling at his lot. Compared with other craftsmen, it cannot be denied that there is just ground for his complaint. Compare him, for instance, to the class of inventors in this country. Inventors labour with their brains and their fingers like designers and artists, and in some instances they sell their inventions to manufacturers. But it will be found that almost invariably the name of the inventor is associated with the invention for many years, and sometimes for ages afterwards. Nothing is more familiar in the manufacturing world than seeing A, the manufacturer, advertising B's invention for making buttons, or pistons, or ploughs, and it is known in the trade as B's piston or plough. B by this means has obtained an advantage. His next patented invention is worth more in the market, by virtue of his name being known. The question then arises why should not the same principle prevail in art productions as well as in scientific productions?

We now come to the most important part of the subject. It is notorious, at all events within the limits of the profession, that architects are not always the designers of the works which go by their names. It frequently happens that an architect has scarcely anything to do with the designing of a church or a font, or the elevation for a warehouse, than merely giving instructions to Green, Brown, or Robinson, to produce such and such a design. How often is it stated that Mr. A. prepared the designs for a competition which Mr. B., the architect, has sent in; or that Mr. C. supplied the drawings for a mansion built under the architectural superintendence of Mr. D. Statements like this are so commonly made, and the members of the profession are so familiar with them, that they are merely repeated as ordinary gossip. It is well to note that architects, more than any other class, have recently, in obedience to the teachings of Mr. Ruskin in particular, set their faces against shams. In fact, the word "sham" is more frequently heard at a meeting of the Institute or Association than at any other meeting of Englishmen. Enough has been said against shams and falsehoods in architectural circles to make the living race of architects not only the purest minded but the most ardent believers in and actors of truth and reality. If the practices of architects amongst *themselves* had been in harmony with this commendable anti-sham teaching, then might architects be regarded as the salt of the earth.

But what a falling off is there, Horatio.

Instead of embodying their teachings in their practices, we maintain, fearless of successful contradiction, that many of them trample their own precepts in the dust. This is a bold assertion, but no more bold than true. The architect frequently sails under false colours. He frequently wears honours which rightfully belong to others. He has credit for designs which he never made, and is supposed to be the embodier of ideas which he never conceived. This is not true of very many of our best architects, who are really a glory to the profession. We could name many who prepare all their drawings, and others who, if they do not make all their drawings, sketch all their designs—men who would scorn to let their names appear to works which were not the products of their thoughtful industry. He who acts otherwise should for ever close his lips as far as shams are concerned. He who fixes his name to designs which are not his own, who wears credit which he never won, is a sham to all intents and purposes. Let no one think we are speaking too severely, or that we are complaining without a cause. We could point to instances in which certain architects have professed to supply drawings, and who have superintended the erection of works which they never planned. Some one may say, this may be the

case, but is it wise to moot such a question and so throw something like a shadow of discredit on an honourable profession. It is because the profession is so honourable that we mention these things, in order that its honour may be maintained. We cannot diminish a sore by hiding it. It is said that a knowledge of the disease is half its cure. The best way to conquer a disagreeable fact is not to run away from it but to look it square in the face with a strong will, and it will immediately begin to melt away.

In the elucidation of this point let us compare architecture to painting, sculpture, oratory, or literature. Architects will, no doubt, say that architecture is inferior to neither of these. To become an orator, a man must himself perform every particle of the work which makes his reputation. He must collect his materials with immense care and thought, and stamp his own image on every sentence he utters. All history and literature are open to him; he is at liberty to use all figures of speech, and he may appeal to the passions, the imagination, and the judgment of his hearers; he may use gesture, and quote from the classics, but what he says must be *his*. It must pass through the alembic of his own mind. Ought it not to be the same with the architect? How often, though, does the architect borrow a bit from one building, a bit from another, and a portion from a third, and just tack them together, and then call the design his own. What, for instance, if the literary man did this, or something like it? What if a novelist borrowed his plot from one source, two or three of his characters from an Italian play, and two or three other characters from a French story, and just threaded them together with some commonplace observations of his own? Why, the trick would be detected, exposed, and denounced. What is sauce for the goose is sauce for the gander. Why should the architect enjoy an immunity not allowed to the orator or the novelist? If it would be dishonest for the painter who enjoys a reputation to employ men to paint his pictures, or the major portions of them, and then exhibit them as his own, why should it not be considered dishonest for an architect to do a similar thing? The great painter must do the whole of the work himself, or forfeit his reputation. If he find other men to cover his canvas, even supposing he suggested the subject and sketched the outline, and then parade the picture as his own, he would assuredly be condemned. If such a thing were tolerated, any man with a few thousand guineas to speculate with would be able to buy an artistic reputation. But it would not be tolerated for a moment. Why cannot a similar standard be erected in the architectural profession? If architecture is destined to assume its rightful position in the world it must be a vital, living thing, and architects must not only declaim against shams in materials and design, but set their face against shams in their practice. We have recently seen an instance of a joint literary production in "No Thoroughfare," by Charles Dickens and Wilkie Collins. The joint workmanship was announced, and no one thinks less of either of these gentlemen for performing merely a part of the work. But had either employed the pen of an unknown literary man, and published a tale, or even a part of it, in his own name, which he had never written, he would, if it became known, be pelted with invective. How different in the domain of architecture! There frequently one man does the work, and another man gets the credit and pockets the profits. Let us hope and wish for better things.

VISIT TO THE TWICKENHAM ECONOMIC MUSEUM.

SECOND ARTICLE.

IN our article last week we described the drawings, models, building materials, and furniture, as exhibited in the Twickenham Enconium. We will now notice the remainder of its contents.

Our guide next introduces us to another long aisle, occupied on both sides by Class IV.—Clothing, &c. Here are the materials of our textile fabrics in their native state, flax, hemp, and a variety of fibrous grasses, cotton, wool, hair, silk, &c. These are all shown in various stages of preparation for the loom. In the department of dyeing we have a case showing the various kinds of bleachers, for the different tissues have to be cleaned and whitened as their first step on the way to our backs, mordants which dispose the tissue to receive the dye, and, lastly, the dyeing materials themselves of all the colours of the rainbow. One very interesting series is a complete set of dyes obtained from the rather unpromising substance of coal tar. By way of practical application of this we have specimens of what the linendraper calls fast colours, and of those that "run" when washed. Our better half once bought a blue woollen dress, which the shopkeeper assured her was dyed with fast colours, but which, in the first wash, became of a dirty disagreeable whitey brown; standing here, we could not help wishing that everyone's better half possessed the knowledge which a comparison of the examples exhibited would undoubtedly afford. Further on are seen processes of tanning, all illustrated with specimens of various kinds of leather and furs. Examples of the elastic gums, india-rubber and gutta-percha, and their substitutes, conclude the series of raw materials. That of textile fabrics begins with the coarsest of all, viz., common matting, both British and foreign; next come specimens of carpets sufficient to illustrate the chief differences in value and durability. Then follows a variety of small matters, to specify the half of which would be to write a catalogue, but all necessary to the proper clothing of our bodies, and which, as we have to expend our means upon, it is only fit that we should know something about. It is intended, as far as possible, to show the processes of manufacture, and, as a beginning, we already see the progress of a pearl button from the oyster shell to the card on which it is sold; respecting all, means are given enabling us to tell the good from the bad. On the opposite side is an interesting and instructive exhibition of the costumes of various nations, illustrated by means of the actual articles, where possible, and a very complete set of pictorial representations showing their adaptability to climate and to occupations. There is also a series, specially prepared by a firm of great experience in the matter of clothing, required by emigrants to our colonies; and another set showing the most approved and healthy dress for infants, a point on which great ignorance prevails, causing sickness and death to the frail innocents.

Turning up the next aisle, we pass into Class V.—Food. We have visited the food department at South Kensington, and venturing upon an allusion to that place, we are informed that this portion of Mr. Twining's collection, which was exhibited in embryo at South Kensington, in 1857, the gave rise to Dr. Playfair's food museum. That is, of course, developed upon a scale of national magnitude, while this, like every other portion of the Twickenham Museum, is intended for an example upon a medium scale of what may elsewhere be enlarged or diminished according to circumstances. We begin with some instruction in the chemical constituents of food, and a table, calculated to teach us to distinguish its varying qualities on genuine scientific principles, while the different methods of preservation are duly illustrated. The animal kingdom is represented by drawings of the food-producing animals of various countries—beasts, birds with their eggs, and fishes—with information as to their degrees of value, and, where possible, specimens of their products. In the vegetable kingdom we see how omnivorous man makes most kinds of corn plants, leguminous seeds or pulse, roots, bulbs, and fruits, contribute to his sustenance. Among the sweetmeats, we learn how injudicious folks promote the injury of their children's health by allowing them to indulge in the cheap trash, often mixed with gaudy but poisonous colouring, of which they are so fond. In the region of spices we are taught the right use of condiments, and reminded of the danger of using food too highly seasoned, like the Emperor Charles V., who habituated himself to dishes seasoned beyond ordinary human endurance, till his taste became so blunted that he complained of his cook for making nothing but wooden dishes, upon which the cook retorted, and truly, that his master had a wooden palate. The plants and their products, of which are made coffee, tea, and other refreshing beverages, are shown, and, likewise, the fermented and distilled liquors and the tobacco plant, neither of which, however much they are to be avoided, can be possibly ignored. Our bane and antidote are both before us. In every section of this food department are some deleterious articles, the existence of which is well known to our grocer and our baker, who, by mixing them in good company, manage to pass them undetected into our very bodies. We allude to adulterations. Here they all are, side by side with the genuine articles, but in solitary confinement, each delinquent shut up by himself in a bottle, with his name of disgrace exhibited for the identification of the world. We take a good look at them: we hope we should know them again; at all events, we know of their existence, and shall be on the watch for them. Respecting the next department—that of household stores for fuel, lighting, and cleaning—we have only time to notice that the collections of oils and fats used for lighting, which are superseding the tallow and wax candle of our fathers, the palm, the cocoa nut, the paraffin, and many others, is very complete.

Class VI., the Sanitary Department, contains so much that is useful, that to describe it properly within our limits is quite impossible. We have illustrations pointing out much that would improve the physical training of our infants. The diffusion of information of this kind would be of incalculable benefit. It is a sad fact that one-fourth of all the infants born die before they reach the age of five years. How many of these untimely deaths are attributable to ignorance? There are also exhibited means for alleviating defective sight and hearing, of occupying the blind, samples of dentistry, and a very complete cabinet of drugs, arranged according to Dr. Royle's Materia Medica, which serves as a text book for their study. Some selected examples of adulterations of drugs, and a set of pictorial illustrations of plants from which drugs are derived, help to enliven an otherwise dry subject. A number of poisonous articles, which might be ignorantly mistaken for the genuine drugs, are shown. The distinction is pointed out between poisonous and edible mushrooms, and the visitor is placed on his guard against a number of poisonous fish. We notice appliances for saving life, life-belts, rafts, and fire-escapes. And here are two chemical substances, tungstate of soda and sulphate of ammonia, either of which, when mixed with the starch, would render muslin, or other light fabrics, comparatively uninflammable, and, if generally adopted, would have saved many a life from destruction by fire.

Passing over many most instructive items, we go on to Class VII.—Home Education, Self Instruction, &c. The education school life is by no means all that is required. That which we give to ourselves or get at home is far more useful and important. This truth is not sufficiently recognized, and many who do acknowledge it are not aware of the facilities available. As far as possible, they are shown here, those for public or school education not being included. They are arranged in three stages, the first showing the parent how much

may be done at home in teaching the infant, next how the boy may supplement his school information in his home leisure, and how, after his school-days are past, he may carry on and perfect the knowledge he has gained, choosing either the ever widening fields of science, or cultivating and developing a taste for the arts of design, drawing, painting, or music.

Class VIII.—Miscellaneous. This is a kind of classified *omnium gatherum* of articles which could not well be put elsewhere, and which yet ought to be shown. We see a collection of every-day scientific instruments, once exclusively used by the rich, now finding their way to every house. Watches and clocks, enabling us to measure our time, and which no one need be without. Thermometers and barometers, instruments which ought to be, and are being popularized, enabling the labouring man to gauge and forecast the weather, not by his often deceitful bodily sensations, but by the most certain indications at present within scientific reach. Weights and scales, with means for comparing the differing measures of various countries. We have illustrations of the various kinds of paper and other stationery, with some of the processes of manufacture. We see various sets of tools for emigrants and articles for use in their new country, and hear with great srtisfaction that this highly useful part is likely very soon to receive special development. We know of few things more likely to be useful in our great centres of emigration than a place which the intending emigrant might visit, where, apart from the influence of interested dealers, he might fully and freely inspect, compare, and judge for himself of the value of various articles required on his voyage or in the country of his adoption. The last thing we notice is a set of "make shifts" and means for lightening labour, the former being contrivances that may be used when better means are not at hand. We remember a passage in the "Missionary Journal" of John Williams, in which he regrets that before his journey to the South Seas, while he was shown all kinds of elaborate instruments, and supplied with treatises describing all manner of scientific processes, no one had thought of the necessity he might be under of wanting to know how to do common things with rude materials, and though in a rude yet in a useful manner. His account of several unsuccessful experiments in the art of making a common pair of bellows is a warning to those who might be inclined to depreciate instruction in "make shifts and means for lightening labour." We think, on the whole, that some such title as this last would not inappropriately describe the whole of the Museum. Were the knowledge attainable here generally diffused, its tendency would infallibly be to soften the care and lighten the labour of us all.

There is still, however, another department to visit, and that is Class IX.—The Library, to which we adjourn. This contains books and documents relating to the various subjects treated of in the Museum, in the order in which they come to social, educational, and charitable economy. We are presented with a printed catalogue, giving us not only a classified list of the most important portion of the books, but also brief indications and criticisms of the nature of their contents, forming a valuable guide to domestic and sanitary literature. Here we seat ourselves, and in a short conversation learn many particulars respecting the history and objects of the place. Experience as a member of the Committee of the Labourers' Friend Society had taught the benevolent projector that much of the privation and suffering of the poor was traceable to ignorance of how to utilize the resources actually at their disposal—an ignorance which many of their would-be instructors shared with the poor themselves. This naturally raised in his mind the idea of endeavouring to remove this ignorance by getting together and explaining the objects upon which instruction was needed. The simple suggestion of a museum would not, however, have been enough. A practical example was wanted. One characteristic of ignorance is that it mistakes itself for knowledge, and this applies especially to our ignorance of common things. We all think at the first blush that we need no instruction about them. We ourselves must confess that we thought we knew much more than we actually did before we walked up and down the aisles of this place, and it is with something like a humiliating sense of our want of knowledge, induced by the visit, with which we sit before our friend in this library. In 1852, the official sanction of the Society of Arts was given to the general scheme of Economic Exhibitions, but it was at the great Paris Exhibition of 1855 that the idea was for the first time realized, a department of Domestic Economy being annexed after the other portions had been opened. A temporary exhibition of the same nature was held at Brussels, under M. Ducpetiaux, in 1856; and two have been held at Vienna, at the instance of Dr. Carl Helm. Domestic economy also formed a part of the national exhibition at Florence, and the requirements of the working classes have not been overlooked in the great Exhibition at Paris in 1867. The first classified display of articles, forming the nucleus of what has since become the Twickenham Museum, was made at the house of the Society of Arts in 1856. Thence it was removed to the South Kensington Museum, where, as we have said, it gave rise to the Food Department. In 1858, it was transferred for a time to the Polytechnic Institution in Regent-street; and in 1860, finding that it needed an amount of care and supervision which his health did not allow him to bestow upon it away from home, Mr. Twining erected the present building near his own house, and removed the Museum there. He, however, hopes some day when, duly completed and arranged, to see it placed in some public position in the metropolis, where it may be better known and receive many more visitors. We cannot held noticing with regret the fewness of names in the visitor's book, accounted for solely by the present unavoidable necessity of the location being at Twickenham. However, there are some of all sorts—foreigners, clergy, medical, and literary men, missionaries to our poor, and the working men themselves. We are happy to hear that the institution has already gained very high appreciation abroad and at home. The Emperor of the French has conferred upon its projector the Cross of the Legion of Honour; the King of Italy recently sent to him the Order of St. Maurice and St. Lazarus; and medals have been conferred upon him by the authorities at Brussels and Vienna. It is not the practice of our Government to confer such distinctions, but the institution is really deserving of every encouragement. It is meant by its proprietor to be the parent of many others in all parts of the country. This part of its mission it has already began to be accomplished, a sanitary museum being at the present moment in course of formation at Brighton, aided by advice and assistance from Twickenham; and we hope we may live to see the time when the name of an economic museum shall be like its contents, "familiar in men's mouths as household words."

THE LABOURERS' DWELLINGS QUESTION.

THIS question, simple as it may appear to some minds, is fraught in almost every direction with difficulties. We therefore hail any suggestion, from whatever quarter it may come, which may tend to smooth away those difficulties, preparatory to the promotion of the work so much desired. We have recently commented at length on the efforts made by the corporation of Liverpool to provide better house accommodation for the labourers of that great town. We have just received an able pamphlet on the question, written by Mr. John J. Stevenson, architect. The author appears to understand the matter in hand. The principal object of the pamphlet is to show that municipal regulations in general actually prevent instead of providing for the erection of labourers' dwellings in large towns. We will let Mr. Stevenson speak for himself. Alluding to the Liverpool Corporation competition, he says:—"The main facts of the case are these:—A year or two ago the Liverpool Corporation secured a piece of land between Sylvester-street and Ashfield-street, intending to devote it, with some other pieces, to the erection of labourers' dwellings, which should serve as a model of what such houses should be, and, from the success expected of them, might induce others to better the dwellings of the poor, at the same time that they made a good investment. The bill lately passed, which enabled the Government to lend money at a lower rate of interest on the security of such houses, seemed to render the scheme easy and practical. The Health Committee was instructed to carry it out, and the borough engineer, Mr. Newlands, received orders to prepare plans. These were estimated, and the buildings might have been commenced, when an objection was started that they contravened the municipal building regulations. These plans are exhibited along with those sent in competition, and, for good and sensible planning, for attention to sanitary matters, and general suitableness for their purpose, compare favourably with any in the room. But, for the corporation to contravene its own laws, even on the promptings of strong common sense, would be an act of impropriety; and it was resolved, in a meeting of the whole council, that these plans should be superseded. But something must be done—the corporation must not admit that their own laws rendered such a scheme impossible; and a competition was decided on. With the liberality characteristic of Liverpool, a premium of £200 was offered for the best design, and it must be admitted that, in the plans sent in, they have got their money's worth. They are between fifty and sixty in number, from all parts of the kingdom, and probably contain among them the result of all our practical experience in building houses of the kind—for the plans are not, as is often the case in competitions, merely the crude conceptions of young men, but many of them by well-known architects of large experience. If of these the plan which best conforms to the by-laws can be shown palpably deficient and faulty, it must surely raise a question as to the wisdom of the by-laws. It may at least be instructive to point out what arrangements of the houses on the ground the by-laws allow, and whether these are not worse than some they condemn.

"The ground is a rectangle of about 250 feet by 120, bounded on the long sides by Sylvester and Ashfield-streets, and at the ends by blocks of houses. It was dear ground for its purpose: costing 18s. a square yard, and it was consequently necessary to arrange a large number of houses on it to get an adequate return. The problem to be solved consequently was, how to get the greatest number of houses on the ground without infringing the by-laws, and it has been stated, on apparently reliable authority, that almost all have infringed them in some point. Along the two already-existing streets, the height of the houses was unrestricted, but if a house entered otherwise than from these streets, or from any new street, it was considered as entering from a court, and the height consequently became restricted to three storeys.

"There is in the competitive plans great variety in the mode of disposing the houses on the ground but—with some exceptions, which though clever and suitable enough on the whole, in some point or other contravene the regulations—they are reducible to two or three general types. The most simple, taking advantage of the height along the streets being unrestricted, is to range the houses in a long block, generally five storeys high, along each (see Fig. A). This leaves a large and airy court in

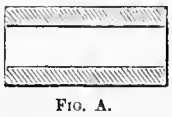

FIG. A.

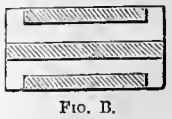

FIG. B.

the centre, and by building five storeys high a sufficient number of houses could be got to make the scheme remunerative. Some designs to this arrangement add a row of houses between the two outside rows, to which access is got by leaving blanks at the end of the rows on the street (Fig. B), or by a street across the centre, as in Fig. C. In this case the centre block, as it enters from a court, can be only three storeys high, so that the houses

to the street, being unrestricted in height, will completely shut out the sun from the central block.

FIG. C.

FIG. D.

To the arrangement C there is also the objection that, as there is nothing to prevent the block being closed up at these ends by buildings on the adjoining properties, these courts may become mere airless *culs de sac*. So that this plan does not secure either sun or a current of air from the houses. And yet this is the plan which the committee find best solves the problem—which gives most houses without contravening the by-laws!

"Compared with this arrangement how much better in every way is that of Mr. Newlands (Fig. D), rejected for non-conformity to the by-laws; securing sun and pleasantness for the houses, and thorough ventilation in every part; giving about as many dwellings on the ground, and disposing the blocks of houses, instead of in dreary rows, in a good architectural group. Its principle is large open spaces connected by narrow openings, but these openings, which are really the salvation of the plan as regards ventilation, condemned it according to the by-laws. Against these it sins, besides, in having houses of more than three storeys entering off courts, a provision which, as we have seen, does not secure light or ventilation or open space, but only that the houses can have cabs brought to their door; which, considering the rate of cab fares in Liverpool, seems an unnecessary attention to the comfort of labourers. No doubt, in old properties, courts are often neither airy nor healthy; but it is an error to suppose that streets for traffic, with their mud and manure, are better than courts, as in reality they can be more easily kept clean and wholesome, if properly planned and arranged.

"Some of the designs get over the difficulty of the narrow openings by closing them altogether, building the block all round (Fig. E), securing

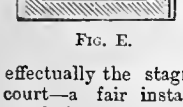

FIG. E.

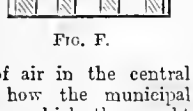

FIG. F.

effectually the stagnation of air in the central court—a fair instance of how the municipal regulations defeat the purpose which they ought to aim at. Some of those on this principle have the houses entering from galleries round the interior of the court, which condemns them to three storeys in height, and consequently prevents a sufficient number of houses on the ground. Why, in the nature of things, apart from municipal regulations, the door being at one side, instead of another, of the house, should affect the number of its storeys, it is hard to see.

"A very favourite arrangement among the competitors is to place rows of buildings across the ground (Fig. F),* but it is impossible by it to get a sufficient number of dwellings on the ground, as these cross streets, though they have ample air and sun, are considered as courts, and the houses in them can only be three storeys high. It is nevertheless the arrangement which most effectually secures ventilation, and is a far more wholesome mode of building than that now practised universally in the new buildings in cities here and on the Continent, of lighting the back-rooms of houses by what are called wells, often only a few feet in width—stagnant pools of air in the centre of the buildings. Any passage, however narrow, would at least secure ventilation; but as building acts everywhere forbid narrow openings, and as the most must be made of expensive land, the difficulty is got over by having none!

From these few instances it may be seen how the municipal building regulations have hampered the designs, and that, when they have been complied with, the result is exactly what it is desirable such regulations should condemn."

After showing the advantages of building houses for the labouring classes in the suburbs of towns, Mr. Stevenson says:—"It is, therefore, not less desirable to get good workmen's houses within the towns; but municipal regulations, not in Liverpool only, but in every town in the kingdom, throw obstacles almost insuperable in the way of this, while they do not prevent bad building, bad arrangements, and bad ventilation—in fact, render these essential to make the scheme pay, for it is only the 'jerry' builders who seem to be able to build at a profit. But it is, as has been already said, much easier to find fault with present regulations than to suggest better; and it would be presumptuous to do more than indicate the direction in which they should aim. At present they insist on a certain width of street in proportion to the height of the houses. This has given us a town like Manchester, with acres of streets in dreary sameness with stagnant air. Would it not be better to encourage variety in planning, narrower streets, opening out into wider spaces and squares, where the difference in temperature between the wider spaces exposed to the sun might draw the air from the narrower streets, causing drafts and movements of the atmosphere? It is clear that streets might be built closer and higher, if their ends opened out on parks and greens, without harming their ventilation, than if they were extended for square miles of regularly disposed street, and court, and house, though only two storeys high. This might be accomplished by fixing the proportion of space left open to ground built on, permitting builders to arrange their blocks as they liked, subject to conditions, of which the most important would be one which present building acts ignore, that there should be no stop gaps to the circulation of the air, no dwelling-rooms opening out into wells or small courts, in which there is no through current. Such an arrangement might be difficult to adjust to work fairly. It would have a tendency to raise the value of property near public open spaces, which, however, is not unreasonable; and it might necessitate power on the part of the corporation to decide how streets should be laid off on private property, so that where one man had commenced a street it should not be blocked up by his neighbour, as happens in some of our English towns. But we doubt not legal acumen could frame a regulation which would secure the desired result directly, instead of the present roundabout attempt at it, which provides streets of a certain width at every part, and yards of a certain size attached to every house, which does not always secure ventilation; and, though a good thing in some circumstances, is often unjustifiable waste. Again, it is obvious that in a short street, if it opens into wider streets, the house may be made high, and the width confined, without the injury to its ventilation which would ensue if it were longer. So that there would be more reason in municipal regulations if they made the height of the houses depeudent on the length of the streets, instead, as at present, only on the width. Had narrow openings, provided they were short, been permitted, several of the most skilfully-arranged among the plans exhibited, including, we believe, Mr. Newlands', would have been within the law, instead of being set aside for contravening it."

Mr. Stevenson gives other instances wherein municipal building regulations interfere with the development of the movement for providing improved house accommodation for the people. The pamphlet is published by Messrs. Webb, Hunt, and Ridings, but as there is no price affixed, we suppose it is printed for private circulation. Mr. Stevenson has, however, won the thanks of the public for his pointed and timely little publication.

* This is the plan which has obtained the competition premium

MANCHESTER SCHOOL OF ART.

THE annual meeting and distribution of prizes, in connection with the Manchester School of Art, took place on the 19th ult. The report stated that the total receipts for the year had been £1,019 2s. 9d., and the expenditure £989 4s. 7d. Mr. Muckley, the head master, read an elaborate report on the state of the school. Regret was expressed that the students were with great difficulty induced to undertake those studies which pertained to the decorative art. It was deemed advisable to withhold the award of the Primrose Silver Medal this year for decorative design, as the works now in preparation for that prize were not yet complete. At the Government examination held here in March last, 40 passed, and 7 gained third grade prizes; and at the national competition, one gold medal, two silver medals, three bronze medals, and a book prize were awarded. Five valuable original drawings by Mulready, had been presented to the school by Messrs. Agnew. The sum of £20 had been presented to the school by Mrs. Goadsby, for prizes to the students, to be awarded next year. She had also announced her intention of making a donation of £500 to the school, to be invested, and the interest to be devoted to such prizes as might hereafter be determined upon by the managers. The annual distribution of prizes awarded to pupils in the Leeds School of Art took place in the Mechanics' Institution in that town on Monday night, under the presidency of Mr. Baines, M.P. In addressing the audience, the chairman spoke upon the comparative deficiency of technical education, and advocated the establishment of schools for art and scientific instruction, with a view to their application to manufactures in the large centres of population, and the provision of a central college in the metropolis. The Report of the Reading School of Art, which was read at a meeting of the school the other day, stated that out of the 73 pupils attending, 37 were successful, 10 taking prizes, the remainder cards of merit. Fifty-eight works were sent to South Kensington for national competition, six of which were selected. One national medallion was awarded, and 10 third grade prizes. The report of the Stourbridge School of Art states that 26 students passed satisfactorily in the second or higher grade, 6 passed, and their papers were marked "excellent," and 6 received prizes. Fifteen out of the thirty works submitted for national competition were passed as satisfactorily executed, and awarded prizes. The Bradford School is also in a satisfactory condition. There are now 89 students on the books, 75 evening classes, and 14 ladies' classes.

BAD MASONRY.

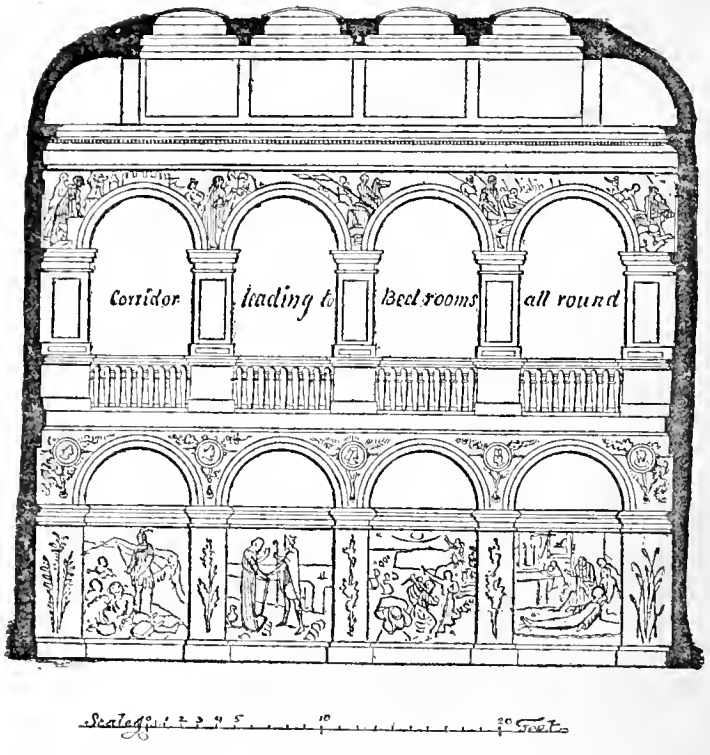
A PRACTICAL builder has sent us ("Pall Mall Gazette") the particulars of an examination of the wall of Clerkenwell House of Detention, which has led him to the conclusion that a very slight pressure was required to effect a breach in it. At the bottom the wall is two and a half bricks thick, that is, allowing for mortar, more than 22½in. About 10ft. higher up, the thickness of the wall diminishes to 18in., and the upper part of it, under the coping stone, is only 14in. thick. The wall is strengthened at intervals of 14ft. by counterforts or buttresses which are 26ft. 6in. broad "in the face," and project 9in. from the wall; these are strong enough to support what builders call a "dead pressure." The bricks (hard burned "slacks") are of good quality. So far there is nothing to complain of. But upon examining the way in which the bricks are put together our informant found serious cause for dissatisfaction. "At some distance from the blown-in gap," he writes, "I saw lines of vertical cracking, which immediately suggested to me an idea of the character of the 'bonding.' Bonding, in building phraseology, signifies in walls the tying of the materials by some other article, built course by course, into the work as it proceeds. In brick walls the bonding mostly consists of hoop iron, varying in width from 1½in. to 3in, being laid along the brickwork in double strips, let us say, every two courses or so, from one end of the wall to the other. When this is of good iron, and properly laid in, it may readily be supposed how it tends to stiffen and strengthen a wall. Judge of my surprise, then, when in this structure, at the House of Detention, not a bit of bonding of any kind was to be seen. I next turned my attention to the mortar. It had a suspicious, chalky look, and was not blue enough for my liking. I placed some good-sized lumps under my heel, and they slowly crumbled away whilst I balanced myself on one leg. I then stood upon lump after lump, swinging myself round half a turn, so as to exert moving pressure, and the stuff went to powder in an instant. As I weighed at the time, clothing, rain, and all, about 200lb., this was a very poor result to get out of prison wall mortar. I filled my pockets with some selected specimens, which I have now on the table before me. I have examined them carefully and leisurely, and the absence of silica, fine, well-washed river sand, is very marked; the substance has a porous, pumice stone look."

It is rumoured that the Liverpool Corporation are about to abandon in despair the scheme of erecting working men's dwellings, and resell the land.

PAINTED DECORATIONS.

THE DUTY OF THE PAINTER IN RELATION TO THE ARCHITECT.

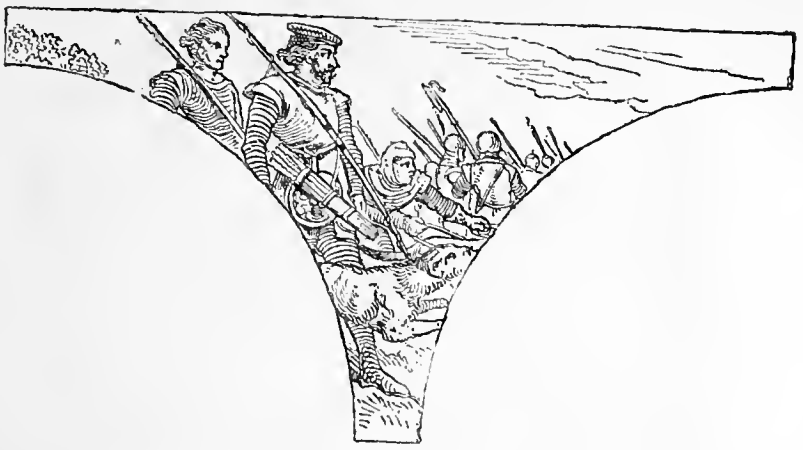
THE division of labour which is necessarily characteristic of dense population, has made painting and architecture markedly distinct professions, and compels us to speak of architect and painter not only as separate individuals, but as separate classes. It is pleasant to dwell sometimes on thoughts of those past days, when the arts were so closely blended, so intimately associated, that the distinctiveness now so unhappily patent was scarcely felt even when it existed. That there was such distinctiveness is very clear from documentary evidence, but such was the interest which one artist took in the work of his brother craftsman that at certain intervals there appeared exceptionally powerful men, able to practise more than one art, and who at last came to be regarded as representative men, when in reality they were purely exceptional. Thus it is that the public, as a rule, know nothing of such names as Ictinus and Callicrates, in connection with the Parthenon, and thus it is that such names as Phidias (B.C. 490—432), Giotto (A.D. 1276—1336), Michael Angelo (A.D. 1474—1564), are in the mouths of every one, serving as arguments to those who desire to show that a great architect must be a great painter or sculptor. That an architect should know somewhat of those sister arts which are so all-important to the proper development of his; that he should be able to set out or plan the whole scheme of the painted and sculptured decoration of his building; that he should know where to place his jewels and his lights; that the proper place for a candle is not under a bushel; and that the proper place for a ruby is not in a pig's snout; that he should be able even to give some idea with his pencil of figure and figure composition; and that he should be master of conventional ornament, by which I do not mean a collection of many patterns, but a director of a few well-designed forms, knowing where to use one, and where to use the other, and thoroughly alive to the important question of scale:—that every architect should at least be thus far able has been urged in former articles. On the other hand, the duty of the painter towards the architect is not less important. For years past it has been constantly urged that the first desideratum in all wall painting is that it shall not be in effect independent of the wall. This is manifestly the first duty of the painter towards the architect, viz., to recognize the important fact that his—the painter's—work is to decorate by means of colour the constructional work provided by the architect. To ignore, or to try to ignore, this constructional ground—to endeavour by all the powers of perspective and *chiaro 'scuro* to conceal the construction—to depart from the lines of the architecture—to set at nought arch and pier, wall and ceiling—to turn our vaults into cloudy heavens; to melt our solids into voids by painting landscapes on wall and pier—the idea of the solidity of these parts being almost as necessary as the real solidity; and to paint subjects so regardless of the architectural forms as to make the latter appear in the way, are, to speak mildly, fundamental errors, for which no amount of good painting *per se* can ever atone. Wall painting is, and must be, a relative art, and cannot stand alone. The question should not be, is it good painting? but, is it good decoration? Some say (I think most unwisely), that if the architecture be thoroughly good your painter must work in relation to it, and subject more or less to certain conventional laws; if the architecture be bad or indifferent, the painter may do just what he likes, and attract as much attention as he can solely to his work as painting. It is the danger of this last doctrine which chiefly besets us now, as it has more or less for five centuries past. I shall not now pause to show the subtle and gradual development



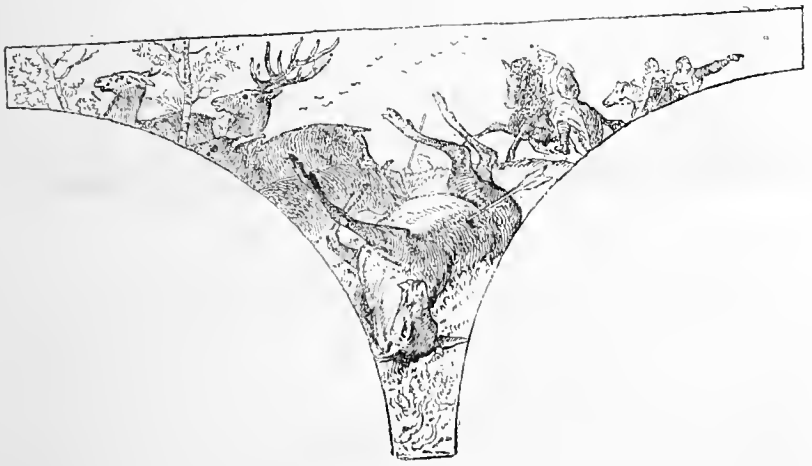
No. 1.—SECTION THROUGH CORRIDORS AT SIR W. TREVELYAN'S MANSION, WALLINGTON.

No. 2.—EARL PERCY PARTING FROM HIS WIFE.

No. 3.—THE KNIGHTS' RETAINERS TROTTING AWAY—HERON, LOVELL, WITHERINGTON, &c.

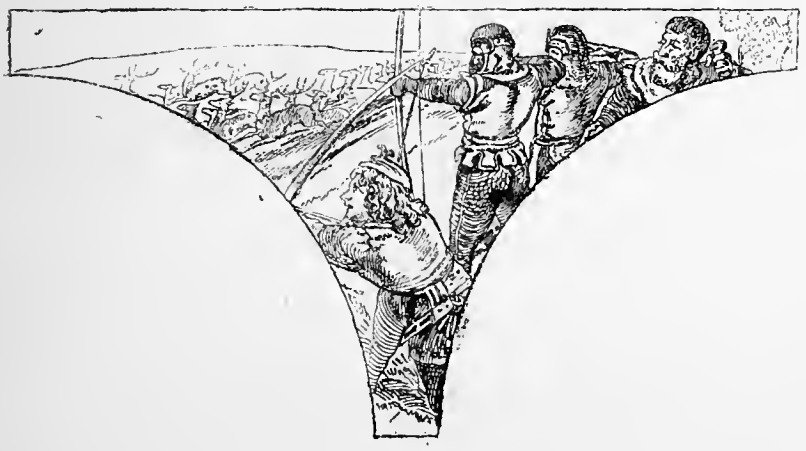


No. 4.—THE FOOTMEN AND BOWMEN—DOGS IN LEASH.



No. 5.—THE REAR OF THE HERD—DRIVERS FOLLOWING.

No. 6.—THE HUNTING—THE LEADER OF THE HERD, A STAG OF TEN.



No. 7.—THE BATTUE—ARCHERS POSTED FOR SHOOTING.

of painting as distinct from decoration, how the bad seed sown in the conventional perspective of the early throne budded in Giotto's architectural backgrounds, and blossomed in the exuberant fancy—almost wildness—of Benozzo Gozzoli, the staginess of Ghirlandajo, and the long vistas of Raphael. The easel painter of to-day is not altogether to blame because he has lost sight of one of the most, if not the most, important aspect of his art. Painters are of all artists most impatient of control. The painters of the nineteenth century, however, are, as far as I can judge, not a jot worse in this respect than many mediæval artists, for from the fourteenth century to the present time there are examples enough to show how completely they defied the laws they should have obeyed, and forgot the building they were called on to decorate, which they failed to do, in the picture they were actually painting. Of course it is very easy to say "so much the better for your art of painting." Whether it was or was not the better course it was certainly the worse for the art of architecture. Directly the essentially decorative arts of sculpture or painting became isolated in the popular mind, the art of architecture suffered, and the more you isolate the painter's art, the more will architecture pass into forgetfulness. A notable instance of this has lately been brought before the Institute of British Architects. Sir Walter Trevelyan's house, at Wallington, was built in the first half of the last century, and it preserved the old tradition of English country houses so far that you entered from the drive directly into the principal room, *i.e.*, the hall, without any intervening corridor, lobby, ante-room, or any other Renaissance luxury. In the centre of the house was the usual open quadrangle, surrounded by two storeys on three sides, and principal staircase on the fourth side. To change this plan and convert the open quad into a saloon with corridors round it was a problem which the late Mr. John Dobson was called on to solve. The architect having reconstructed the walls of the quadrangle, and produced two storeys of arcades, sometimes open and sometimes blocked, Mr. W. B. Scott was commissioned to decorate the same. It is to the upper series of paintings that I wish to call attention, and as illustrations of these are given in the current number of the sessional papers of the Institute, I shall take the liberty of referring to them. The constructional or architectural field selected for the paintings are the spandril spaces between the arches, and a few inches above the arches between the apex of the outer arch moulding and the lowest moulding of the entablature. Mr. Scott says "the house being a Border mansion, the decoration, which was put into my hands as a pictorial rather than an ornamental undertaking, was treated with reference to Border history." He also says that Mr. Dobson was "the able architect of Newcastle." It will be here observed that the painter admits the architect to be an "able" man, and that his commission was to decorate the architecture by figure subjects from Border history. The old ballad of Chevy Chase is the story illustrated. The entire height of the wall space between the capital of the arch piers and the entablature over the arches is 4½ft. or thereabouts, and the arches nearly meet. There are ten double and eight single or angle spandrils. The foreground figures are the full height of the space. It is scarcely necessary to describe any more; the word "foreground" explains at once the pictorial character of the paintings; and if it be added that the painting is continued over the arches, without any sensible break; that two spandrils sometimes form one scene; and that there are but a very few figures which are not, so to speak, cut into by the arches, it will be seen that the work has not merely no relation whatever to the architecture, but actually places the latter at such a disadvantage as to appear an impertinence, the arches looking not as if the painting had been executed to fit them, but as if they had been

ruthlessly cut through the painting. Thus in spandril No. 2 we have the head and shoulders of a page on one side, and the head and shoulders of a horse on the other. In No. 3, the hind quarters of a horse, but no legs; in No. 4, a one-legged archer, bisected by a two-legged dog; in No. 7, the trunk of an archer, and so on. No. 6, "The Leader of the Herd—A Stag of Ten," and No. 5, "The Rear of the Herd," are saved from any decided mutilation, but foreshortening and scenic backgrounds are not conducive to the maintenance of architectural laws. That Mr. Scott has told the story well and poetically, and that Sir Walter Trevelyan's desire to unite the three sister arts was in every way praiseworthy, are beyond dispute; but if these paintings are examples of what "painters of eminence," as Mr. Seddon calls them, would do with our architecture, I see no reason to regret that it should be "a rare occurrence." To return, however, to the notion that, when the architecture is unsatisfactory, the painter has only to regard his own department. Now, I cannot help thinking that such a view as this, enunciated by "one of the greatest of living artists,"* retards very much the consummation we desire to see, viz., the proper union, and, therefore, equal balance of the sister arts. If a building be radically bad, why paint it? Why enrich it to such a degree that the hope of rebuilding would be a vain thought? Why place your jewel in the swine's snout, or mend your old garments with new cloth? Besides, who is to determine the amount of unsatisfactoriness in a building which secures to the painter of it a licence to work independent of all architectural laws? Is the painter to be the judge? If not, to whom must we look? To say that because a wall is a plain wall, with no mouldings or constructional lines about it except its boundaries, therefore a painter is at liberty to do as he likes, and treat it as if it were not a wall, and that the addition to it of one or two stringcourses and half a dozen pilasters or niches, under thoroughly good architectural judgment, should change the whole conduct of the painter, and subject him to mural laws which he before ignored, is simply to say that practically we know nothing worth knowing about the subject. The first duty of the painter who accepts a commission to decorate or paint a wall is the same whether the wall belongs to a railway shed or a cathedral, a suburban villa or a palace; and that duty is to preserve intact the flatness and, consequently, the solidity of the construction. Anything gained at the expense of this is a loss to that art unity for which we are striving. It matters not whether the painting be or be not the most glorious work ever painted, whether the figures are life-like or not, whether the artist has thrown into it his whole soul or only half a soul; if the coronet crushes the brow, if the form of the dress fails to suggest the body, away with them both to a museum; they may be very lovely in sheen of priceless gem and waviness of broidered pattern, but they have not fulfilled the work they were required to do. Mr. Herbert, Mr. Leighton, and Mr. W. B. Scott, may be able to paint pictures on walls, but neither of them has yet shown that he is at all capable of decorating architecture, or that he has the faintest idea of wherein lies the duty of the painter towards the architect.

EDWARD W. GODWIN.

* See Professor Westwood's advertisement in the "Athenæum" of last week.

CENTRAL CREDIT AND DISCOUNT COMPANY'S OFFICES, LOTHBURY.

THE new building of the General Credit and Discount Company stands upon the site of the former house, No. 7, Lothbury, with the addition of the ground of No. 27, Tokenhouse-yard incorporated with it, making a block of 81 × 28 and 72ft. high to cornice, and has been erected from the designs of Mr. G. Somers Clarke, the company's architect. In common with all City buildings where ground space is as valuable as it is near the Bank of England, the accommodation can only be obtained by a number of storeys, which in this case, including a basement, amounts to six in all. The basement has the registrar's department, the strong rooms, washing rooms, &c., and heating apparatus by Perkins. The ground floor—the general office, discount department, and discount manager. The first floor—general manager's room, his clerks, two waiting rooms, and the board room, having a stone balcony in the Lothbury front. The second and upper floor are devoted to the secretariat, the solicitor's, and other departments of the business of the company, with the housekeeper's and porter's accommodation on topmost floor. The materials used are Portland, red and yellow Mansfield, with selected Serpentine shafts to the uppermost stage and to the shafts of the principal door. The fittings and finishings of the interior are all carried out and designed in harmony with the style of the exterior. Messrs. Lucas Brothers were the builders; Mr. Atley and Mr. Clamp, clerks of the works; Mr. T. Carter executed the carving; Mr. Redfern the bas-reliefs; and Mr. Steel was the contractors' foreman.

OLD DOORWAY, STEETLY ABBEY.

WE furnish our readers this week with an illustration of a most interesting doorway at Steetly Abbey, Derbyshire—a very fine example of Anglo-Norman work, and though much time-worn, still retains sufficient of its pristine beauty to render it an object of interest alike to the architectural and archæological student. There still remains enough of the carving on the shafts to show that it must have originally been of a most elaborate character. The capitals appear to have been worked to the desired form by the mason, and the design then carved upon them in bas-relief. The arch-mold is bold and deeply recessed, as may be seen by the depth of the shadow. Our view is drawn from a photograph taken by Mr. Theophilus Smith, of Sheffield.

SOUTH KENSINGTON MUSEUM.

IN addition to the attractions offered to visitors during the Christmas holidays by the collections at the South Kensington Museum, the Committee of Council on Education have, says the "Society of Arts' Journal," pushed forward the arrangements for the exhibition of the purchases made at the Paris Exhibition, which have recently arrived in England. These latter, as well as some valuable loans, have been temporarily placed in glass cases, and opportunities during the holidays will be thus afforded to the public to view these treasures. The loans acquired from the gallery of the "Histoire du Travail" at the Paris Exhibition, although not numerous, are of a highly interesting character, not only from their being extremely curious and rare as works of art, but chiefly from the fact that they are the property of foreign governments. A most admirable system of international intercourse with foreign powers in relation to works of art may be thus said to have commenced. In the Loan Court are to be found the Crystals lent by the Austrian Government. They consist of five pieces; one piece, standing about 3ft. high, is handsomely carved, and for size is the most important. The enamelled gold work which surmounts the crystal is a delicate piece of execution; and the vase with two handles, richly cut, is a marvel of skilful and dexterous workmanship. Without the evidence of the presence of this vase it would be hard to conceive that any workman could have, out of a simple rock crystal, produced so charming a result. In the case next to the crystals are shown curious specimens of very ancient gold work, discovered at Petrossa, in 1837, and lent to the museum by the Roumanian Government. The date assigned to their origin is about 450 A.D. The work is considered as probably that of Gothic tribes, and the style of the design is called Byzantine. The shapes of the objects, the setting of the stones, and the remarkable pierced work, should be carefully inspected. The largest piece is a salver, about 2ft. 3in. in diameter, with a somewhat rudely stamped ornament round the circumference. A patera is in a good state of conservation, and is, apparently, a capital illustration of the style of art employed at that period for gold work. Adjoining the Loan Court is a portion of the museum assigned to purchases, and here, under glass cases, at the north end of the court, may be found the purchases made from the Paris Exhibition. Of the principal purchase, exquisitely carved and inlaid with precious stones, the spinette by Annibalii de Roxis, Milan, 1577, standing by itself. As a work of art it is unrivalled in the museum. Next to it, but of a totally different genre and date, is the famous inlaid and sculptured wooden cabinet by M Fourdinois, which elicited so much admiration from visitors to the Paris Exhibition. The Italian peasant jewellery, bought from Signor Castellani (through whose means the spinette referred to was likewise acquired), occupies four cases, and has much interest for our jewellers, who would do well to adopt many of the elegant designs to be found in this collection. There is a small assemblage of musical instruments of foreign countries. This, however, is but a part of what was purchased at Paris. The instruments from Japan and China are very eccentric. Beyond this case are specimens of Turkish popular jewellery, and a Norwegian marriage crown. The form of the Danish silver parcel-gilt drinking-vessel is curious, but seems awkward. It is of modern execution but of ancient design. The artistic fans, from the atelier of M. Alexandre, are well represented by eight elegant examples, of which the more noticeable ones are by Messrs. Alexandre, Froment, Frossoy, and Regina. Opposite the inlaid cabinets from Copenhagen stands a very fine vase, of French manufacture, in modern enamelled earthenware, of Persian design, by M. Collinot. The style of this piece of pottery is excellent. A collection, comprising chiefly modern French porcelain, German glass, Austrian ormolu, and French bronzes, complete the artistic purchases from the Paris Exhibition. In the north great court some very accurately working models of mechanical contrivances, cog-wheels, pistons, &c., &c., by Von Schröeder, of Darmstadt, are exhibited temporarily.

DIRECTIONS FOR POLISHING WOOD.

THE following directions for polishing wood are taken from "A. F. B.'s" work on wood carving, noticed by us a short time since. The materials required are a little of the best French polish, a little sweet oil, and a small bottle of spirits of wine; glass paper, some old linen, and a little cotton wool. Use leather gloves, as the polish stains, and might be troublesome to get off your hands. Before beginning to polish your wood, you must rub it, not up and down, but with a circular motion, with glass paper, till its surface assumes a soft satin appearance; the wood should be close in grain for successful polish; it will sometimes require hours of rubbing before it is perfectly free from rough particles.

Make a dabber of the cotton wool, wrapped in linen, and tied firmly at the top; moisten it with the French polish, and one drop of sweet oil (the oil is only for the purpose of diminishing friction), and rub the wood with an even, but not hard pressure, in circles, all over the surface; the only point is that the polish should be distributed evenly over the surface, and the same amount of rubbing given to each part. Continue rubbing until the wood begins to reflect; it may be an hour or so before you see this glassy appearance. Then put the wood by for four and twenty hours, that it may dry perfectly; the next day the polish may be almost entirely absorbed. Repeat the process, with the intervals for absorption, until the reflection is as perfect as glass; twice is generally sufficient, but I have repeated it five or six times on very absorbent woods.

When you are satisfied with the reflection, take a fresh clean dabber, damp it very slightly with the spirits of wine, and rub very softly and evenly over the polished wood; it will bring out the polish beautifully, and fix it permanently on the surface. I never knew this process fail, though it requires patience. Be careful to put sufficient polish on your wood before using the spirits of wine, as you cannot add any afterwards. Should it be desirable to stain the wood, use a little dragon's blood (a beautiful scarlet powder) with the polish, and the wood assumes a deep orange colour.

Mr. G. G. Scott will deliver his lectures on Architecture at the Royal Academy on Thursday evenings, Jan. 23 and 30, and Feb. 6, 1868.

PROPOSED VICTORIA PARK, PORTSMOUTH.

PUBLIC parks in populous towns have been called the breathing places of the people, and we think with equal propriety higher functions may be assigned them in a social and moral aspect. The public parks of London have produced incalculable good. As part and parcel of that world of thought and industry, they have materially aided to make it what it is, and the beneficial results that have been derived from their use have been none the less felt, though perhaps unseen. Town life is a stifled life. Business-worn men rush out of town at Christmas time, at the long summer vacation, and even at the close of their day's labour, to seek enjoyment amid the refreshing elements of country life and the gladdening associations of Nature. They learn to associate their vocation and business with pent-up offices and streets, and smoke-laden atmospheres and crowded thoroughfares, and the very wear and tear of life itself.

Sumptuous architecture may line the streets, and sanitary science may have accomplished all that the laws of health can demand, but even all these things do not compensate for a clear blue sky and fresh air. The denizens of the east end of London have felt the want, as they now recognize the inestimable advantages, of a large park in their midst; and no one can deny the benefits that flow from a large unrestricted area of grass-sown land, even though thinly planted with trees, when such a boon is within walking distance of the doors of the poorer and more closely confined masses of the population. The successful appeal of one gentleman on behalf of the working classes of one of the densest of our seaport towns to obtain for them about fifty acres of land belonging to Government, hitherto principally used for sheep pasturage, and to utilize the same for the higher object of the people's recreation, cannot be too highly eulogized. By a happy thought of Mr. Francis Fuller, of Westminster, the people of Portsmouth have at length acquired what they have so long vainly sought for. Mr. Fuller, with his usual ability and foresight, applied directly to the head of these realms for the object he had in view. Our excellent Queen Victoria, whose name the projected park is to bear, with her wonted condescension and regard for her people's welfare and enjoyment, at once communicated with Mr. Fuller upon the subject, and in the course of one month—through the facilities afforded by General Grey and Sir John Pakington—the consent of the War Department and the Lords Commissioners of Her Majesty's Treasury was obtained, and a great boon to the people of Portsmouth consummated.

The inhabitants of Portsmouth, Portsea, and Landport number upwards of 100,000; the streets are narrow and densely crowded; criminal statistics have in this locality shown a higher average than those of other towns, mainly attributable to the want of those essentials for physical and mental enjoyment afforded by open spaces or grounds for recreation. Socially, these benefits have in all instances tended to elevate the moral tone of all classes of the neighbouring community. The advantages to be derived from parks and open spaces may be somewhat estimated by the results experienced in other towns; and to take an example within the same county, namely, Southampton—also, like Portsmouth, a seaport town—has, since the formation of its public park, indicated a marked diminution in the statistics of crime, as well as in its rate of mortality, and in this latter respect we believe ranks second only to one other town in the kingdom. Like that of Southampton, the land to be appropriated for the recreation of the Portsmouth people is centrally situated, near the railway terminus at Landport; and if judiciously laid out, with a pleasing admixture of deciduous and evergreen shrubs, combined with well-formed walks, and other accompaniments of a public resort, the proposed Victoria Park, under well regulated by-laws and a proper municipal control, will prove one of the greatest blessings ever conferred on this densely populated seaport. The mayor, Mr. Emanuel, has, we understand, been active in advancing this project, by eliciting information preparatory to laying out the ground; and we heartily congratulate Portsmouth on the prospect of an early acquisition of a people's park, and hope that her Majesty, whose good word has begun the desirable work, will also honour its opening with her presence.

WASTE HEAT IN OPEN FIREPLACES.

THE utilization of waste heat from open fireplaces is a subject which, it will readily be admitted, could not be more opportunely discussed than at the present season of the year. It is just now that we are feeling the full force of the fact that, in the mass of our dwellings, there are serious defects in construction, and a vast amount of heat is wasted in consequence. Few things are more cheerful to look upon than the bright open fire of the English hearth, to say nothing of the poetry of the fireside. As compared with it, the close stove of the continent is a very gloomy affair, besides being a less healthy method of heating, and could never find favour for domestic purposes in this country. And yet, with all the superior advantages which we possess in the open fireplace, we seldom—if, indeed, ever—get the full benefit of the coal we consume. Our grates burn a maximum of coal and give a minimum of heat. As Mr. F. Edwards, in his new work on ventilation and waste heat, remarks—"We allow a large body of warm air to escape by every chimney in which there is a fire, but, from the labourer who rents a cottage with a bed-room over his sitting-room to the South Kensington mansion, rented at £500 a-year, not the slightest attempt is made to turn the heated products to account for the purposes of warming." During the late outcry about the exhaustion of our coal mines, almost every writer on the subject insisted upon it as the chief duty of every consumer that the quantity of coals used for household purposes ought to be reduced to something like a fractional part of the present rate of his consumption. By this means, it was argued, would the great national supply be economized. Very likely; but it would be at the sacrifice of personal comfort, or, rather, with an increase of the discomforts already experienced. It is not with poor Bob Cratchet's "one coal" fire that we can expect well-warmed and well-ventilated houses. No doubt the economization of our coal is a very important consideration; and of the thirty million tons which are used annually for domestic purposes alone, a large quantity is unquestionably lost through sheer waste. Moreover, it seems evident that, since the consumption of coal must increase with the increase of the population and the diffusion of wealth, so also will the waste increase, in spite of Mr. Mill's doctrine—beautiful and true as it is—of our duty to posterity in regard to this very matter of fuel. But while we do not believe in the desirableness or the practicability of introducing into our dining-rooms close stoves which consume only twelve pounds of coal in twenty-four hours, as Dr. Arnott would have us do even in winter, we think that any reasonable hints, calculated either to avoid the wasteful expenditure of so valuable an article, or to extend the utility of whatever is consumed, deserve the most serious attention. In our article on ventilation in dwellings last week, we noted some of the schemes which have been proposed with a view to effect this end. The same able authority already quoted furnishes us with others of an equally practical kind. One thing may be taken for granted, that in many fireplaces, when a fire is burning, a quantity of air is discharged up the chimney, in the course of a few minutes, equal to the whole contents of the room. This evil would be removed, or at least diminished, by the use of a proper regulator, such as we formerly described, to control the opening of the chimney. And an additional remedy would be the introduction of a special supply of air in proximity to the fire by means of a tube, in order to check the draught over the floor. Much, also, might be gained, in the opinion of Mr. Edwards, in the way of reducing the consumption of coal, and at the same time in obtaining greater heat by the use of proper materials in constructing a fireplace, by attention to the laws of radiation and reflection, and by such means as promote good combustion, and insure that, at the same time, a fire shall burn with steadiness, and, as far as possible, with regularity. He advocates a smoke flue of cast iron, instead of fireclay or brick, because, though overheated iron injures the air, it is possible to prevent it from being over-heated, and its power of conducting heat renders it, under some circumstances, the best material that can be used. It is not the best material at the back of a fire, because it allows the heat to pass away. Brick is preferable, since it retains the heat, and radiates it powerfully. For the admission of warm air to rooms, apertures capable of regulation, near the floor, instead of near the ceiling, because a low level is always the proper position for introducing a current of warm air, and care must be taken that the total amount of apertures in the various rooms do not exceed the horizontal area of the warm air channel, or there may be a liability of the warm air passing by one room and ascending to another. For the escape of air, the fireplace may be supplemented by ventilating flues of proper area in the partition walls opposite the windows, or in the party wall. The windows, also, might be made available, to a very important extent, in rendering our houses more comfortable. Among the suggestions made by the Commissioners on warming and ventilation, was one recommending the general use of double panes of glass in the same window sash, for small rooms, and double sashes for large rooms. The latter were to be placed not less than 5in. or 6in. apart; and in the case of the double panes, it was recommended that the glass should be separated only a ¼in., in order that the existing fittings might be the more readily adapted to the new arrangement. Mr. Edwards suggests that if the space were ½in. instead of a ¼in. the result would be still better, and, of course, he is right, but this plan would be attended with much greater expense. However, there can be no question as to the immense benefit that we might confer upon ourselves by adopting the simple expedient of interposing a second sheet of glass in our windows. Besides, double panes, like a good wall, are useful both in summer and winter. Like all non-conducting materials, they keep out the rays of the sun at one time and retain the heat of the fire at another, and their utility is so unquestionable; they entail so little outlay, and that only in first cost, that we may hope, some day, to see the system sufficiently recommended, or insisted upon, to ensure its very general introduction. We have, probably, in the matter of dwellings, run quite sufficiently on the career of the greatest possible display for the money for it to be time that attention should be more carefully given to the promotion of health and convenience.

SCULPTURE.

MR. WESTMACOTT, in a lecture recently delivered at the Society of Arts, on this subject said, in urging upon those who really take an interest in art, the value and importance of education in its principles and position, he had, on the last occasion, referred to it as a means of increasing their enjoyment in looking at works of art, and of giving them self-reliance in forming a judgment on the merits of a picture or a piece of sculpture. He should endeavour to place before them the various

recommendations that a study of art possesses beyond its charm as an exponent of sentiment or of beauty, whether in form or colour. The public was not only generally uneducated in practical art, but it was equally uninformed in its history and the important functions it fulfilled, as a contemporary record of the state of nations and of their civilization, when the more ancient works were produced. As illustrations of the condition and habits of the people amongst whom it was in its first ages practised, the remains of old time had an interest far beyond what any modern art could offer. Monuments of sculpture, especially, were, at one time, the only records of memorable events. They pourtrayed the great acts of kings, heroes, and conquerors. They marked important historical incidents; and from them we had acquired an insight into the mythology and the poetry of the ancients. In these representations we had most curious and reliable authority for the costume and habits of remote nations of whom there was no written or other recorded account. Here, then, they stood out with an interest entirely their own, and independent of any recommendation, as regarded art excellence. There could be few present who had not seen the sculptures from Egypt, Spain, Hindustan, and from early Greece and Asia Minor, now collected in our British Museum. Some of these were of extraordinary antiquity, and we felt grateful for their preservation, while we stood with a feeling akin to veneration before works executed long prior to any written history. The monuments of Egypt probably mounted up to not less than 2,000 years before the Christian era. The sculptures brought from Nineveh and its neighbourhood exhibited a comparative perfection of workmanship that showed long practice; yet we know that the wonderful city from whose ruins they were exhumed, was utterly destroyed above 600 years before Christ. This comprehended a period of nearly 2500 years, and many of the sculptures must have been executed long before this event. Incidentally, the peculiar symbolic treatment of these monuments was explained, in the union of intelligence, force, and motion or activity, in the colossal and other figures where the human head appeared joined to the powerful muscular body and legs of the lion or bull, while enormous wings expressed the capability of rapid motion. The sculptures of the Parthenon from Athens, though not amongst the earliest works of Greece that might be referred to, had also that extra interest which was afforded by the certainty that from the age of Pericles all the greatest men of ancient classical times—generals, poets, historians, philosophers—had contemplated and doubtless admired those very productions. In the larger number of the older works of Assyria and Egypt, there were the most minute representations, both in painting and sculpture, of the everyday habits of the different nations; their wars and conquests, their amusements, their occupations in handicraft, their building, boating, in short, all the various business of life. Here, surely, was sufficient to give an absorbing interest to representative art, simply in its function of illustrating human life and progress.

The lecturer then proceeded to give a rapid review of the different schools of sculpture from the most ancient period. At about 450 years before Christ, sculpture, hitherto treated without reference to and art-excellence, began to be practised on a new basis. It was then not only used to illustrate the religious myths and heroic deeds of the Greeks, in the rude style of the earlier time, but the principle was introduced that these noble subjects should have their expression in the most perfect forms. Then began an entirely new phase of art, most important in its practice. The school which ranked highest in this noble achievement was that under Phidias and his contemporaries, when the most sublime subjects were represented under the most majestic and dignified forms. To this succeeded the school of Praxiteles, who, departing from the more severe and pure treatment of the previous artists, made beauty itself the object and end of art. This, though the subjects were still religious, introduced a sensuous style, in works of exquisite and attractive execution. It was a downward step in art, because it made its appeal to the eye and sense alone, and not to the purer and more noble sentiments. After this came the school of Lysippus, which still further deteriorated from the high standard of the greatest masters. He was the favourite sculptor of Alexander the Great, and it was under that ambitious, self-glorifying monarch that portrait sculpture was first introduced. Here individual character and details were studied, instead of the larger general type of form seen in the most perfect works of nature; and, although productions of great merit were supplied by the sculptors of the period, and for some short time after the death of Alexander, the most perfect style of art ceased to be the object of study. The time during which sculpture in its finest form flourished was comprehended in the comparatively short period of 200 or 250 years. The lecturer then traced what he called its downward course to later times—to its existence among the Romans, where, owing to the peculiar character of the nation, what was termed fine art, as it had been practised in Greece, excited little or no sympathy. The lecturer took occasion, after still further extending his survey, to return to the proposition with which he set out—namely, that there were many grounds of interest to recommend art to the attention of thoughtful and cultivated persons beyond its attractions as a means of mere representation or imitation, and as the outward expression of sentiment and beauty. He concluded by hoping that he had succeeded in impressing this fact upon many present who, probably considering painting and sculpture only in an objective point of view, had not carried their interest in it beyond the pleasure it was capable of affording them as material art. This, of course, in these days was a great purpose of painting and sculpture; but the earlier function it fulfilled gave a dignity and character to its history which deserve the recognition of all persons of reflection and education. The higher the estimation in which any object was held the greater its interest and the reason of its attractiveness to all persons of sensibility and of cultivated minds. The lecturer said his purpose in dwelling on the uses and application of art in the earlier ages, its history and progress, independently of its material charm, was to incite this extra interest.

In a subsequent lecture, Professor Westmacott said the earlier painting and sculpture employed in the Gothic period scarcely deserves the name of fine art, wanting as it is generally in almost all art qualities. It is true it was only used for decoration; but still it professed to imitate something, and this should have been Nature. Wells cathedral is one of the oldest edifices in England which is richly ornamented in this way, and it exhibits crowds of statues on its exterior. These are of the most primitive character—out of proportion, and, in execution, rude in the extreme. The contrast, as regards the accessorial art connected with Gothic architecture, is remarkable when compared with that employed by the great Greek artists—in the Parthenon, for instance. Here the most perfect architecture of its kind was enriched with expressive sculpture of the most perfect forms in nature; and it is this combination or union that constitutes the highest form of art. The short duration of Gothic architecture, and the constant changes it underwent, may account, in some measure, for the incompleteness of the imitative arts in connection with it. It must be borne in mind that in the short space of about three hundred years it passed through many phases—from the Romanesque to the Pointed or early English style—from that to the florid or Decorated, and then to the Perpendicular, when it may be said to have collapsed altogether. So unstable and unfixed in its own principles, it scarcely allowed of perfection in the arts associated with it, though those arts had a fixed standard, had that standard been followed. No person of sensibility, or who has any genuine feeling for the beautiful and picturesque, can deny the charm, or altogether resist the fascination that is found in the best examples of true Gothic architecture. Much of this may be owing to religious association; much to the imagination, which is pleased to conjure up anew, and picture to itself visions of the olden time. But there is, unquestionably, also a positive claim to admiration, in the originality, the bold fancy, the variety and play of parts, the contrivance of scenic effects in the perspective views, and in the striking contrasts in *chiaro 'scuro*, which are so remarkable in the monuments of this peculiar style of art. Still, with all these admissions, the lecturer said he was bound to protest against the outrages committed against truth and fitness, and, indeed, common sense, which were so constantly seen in the Gothic use of accessorial imiative art. This fault was the more to be regretted, because there were many redeeming indications of grace and feeling in the sculpture, especially in drapery and in the sentiment of monumental design. But how the fitness of nature was abused is seen when human faces, of saints, kings, nuns, and ecclesiastics, are found employed as corbels and brackets to bear weights, or as terminations to dripstones, or as gurgoyles or draining pipes; or when entire or truncated figures, angels or others, are seen suddenly starting from walls, their drapery clinging to them in stiff horizontal folds instead of falling by any law of gravitation; or standing figures thrust into arched hollow mouldings; or others dislocated and distorted to accommodate them to fill up spandrils of arches or other spaces. These incongruities are the more curious and striking because it has been seriously asserted by the admirers and advocates of mediævalism that these were the days when religious art was practised with a devotion, and a feeling of truth, purity, and of pious impulse, unknown at present. It is a mistake. Students of Gothic art must know instances enough which contradict this theory, not only as regards truth in imitation, but in the scandalous and even indecent sculpture still to be met with in screens, stall seats, and other parts of some of the most admired Gothic churches. These exhibit proofs of a licence, in this respect, which certainly would not be thought of in these degenerate days, and more especially as decoration in places devoted to religious worship. Still, there was a promise of excellence in this Christian art. There often was much gracefulness in composition, and, in the draperies especially, elegance and beauty. Some places showed very superior art to others, as, for example, Lincoln; and there were signs of improvement of the most encouraging kind. Unhappily, a revolution, fatal, as it turned out, to the progress of art, changed the character of the age. This was occasioned by the passion created for classical studies, by the discovery of manuscripts and remains of Greek and Latin literature, in the 15th and 16th centuries. The educated and influential classes devoted themselves to this new attraction, insisting that everything should be done to establish a pseudo-classical taste. The Italian language had to give way, in polite correspondence, to the Latin; and in this ill-directed enthusiasm the philosophy, faith, and, at last, even the morals of the ancients were accepted with all their consequences. The Medici family, the great patron of this movement, and the infidelity and dissoluteness of the courts of Florence under Lorenzo, and of Rome under the Popes Leo X., Clement VII. (Medicis), and others, were, as is well known, the scandal of Europe. Art, and more especially sculpture, was influenced by this fashion, and became conventional and academic. From Michael Angelo and Giovanni di Bologna, to Bernini and Roubiliac—all men of undoubted genius—each artist but added contributions of a false and spurious style, neither purely classical nor, on the other hand, appealing to modern feeling. Some of the works of the leading sculptors were here described, and the genius and versatility of Bernini in particular, dwelt upon. As is usual, the imitators of these greater men only copied their faults, and by the end of the eighteenth century all true art-sentiment seemed extinct. This was the state of art when Flaxman and Canova stepped in to stem the torrent of false and bad taste. Canova was deservedly eminent in a certain class of art; and he suppressed the extreme flutter and mere executive display of the Bernini and Roubiliac schools. But his own style was somewhat mannered and meretricious. Flaxman founded his works more on the examples of the school of sentiment and simplicity inaugurated by the Pisani and their scholars; and showed the value of those qualities, contrasted with the academical pretension and the mere workshop merit that had so long prevailed.

DECORATING A WORKHOUSE CHAPEL.

SOME weeks since, Mr. J. L. Foster, says the "Yorkshire Gazette," and one of the guardians of the York Union, applied to the Board for permission to undertake the decoration of the large room in this workhouse, which is used for the purposes of a chapel, and also as a dining hall, and the walls of which have been heretofore covered with whitewash. The requisite leave was given by the guardians, and the funds being provided by a private subscription among a few gentlemen who take an interest in such matters, Mr. J. W. Knowles, of this city, mural decorator, was commissioned to carry out the work, which he has done to the entire satisfaction of all who have seen it—converting a mean-looking apartment into as comfortable a place of worship as could well be conceived. The chapel is in the

form of a T, the pulpit and reading desk occupying the place where the cross unites. The central portion extending directly in front of the pulpit, being more definite in form than the two ends, by the introduction of a pillar between each window, more decoration has been bestowed upon it. The ceiling, which is divided in certain places with beams (the pillars above named being for their support), has been coloured a warm buff, and thrown into panels by an ornament of a darker shade. The walls from the ceiling to the window heads is coloured the same buff as the ceiling; from thence, down to the dado, they are a sage green, having ornamented bands of a deep yellow and red running across horizontally, the intermediate spaces being filled with fleur-de-lis of a darker green. On the face of each pillar, which is coloured grey and deep yellow alternately, is a fret in Indian red, banded by a style of sage green. A fret is also stencilled under each beam. On the face of the beams, and over the windows, are lettered appropriate Scripture texts. The two ends of the building alluded to previously are treated in a similar manner to the central portion, excepting that in the place of the fleur-de-lis and bands a diaper colour in red, black, and green has been substituted, with a border in deep yellow at the top and bottom. The doors and pulpit are painted two dull greens, with an ornament in red on each panel. The dado is Indian red. The seats have also been stained and varnished. The effect of the whole is to give an air of warmth and comfort to the apartment, which was used, for the first time after its completion on Sunday last, for Divine worship. The chapel will hold about 150 persons.

WORKMEN'S COLLEGE.

A WORKING Men's College has just been established in Blackfriars-road. It is intended to offer to working men in South London an education of a sound and efficient character, by means of classes in languages, mathematics, physical science, moral and social science, together with lectures on history, politics, &c. There will be also, in connection with the college, a night school (for men only), a day school for boys and girls, and afternoon classes for women. The college, which is based on the principles of the Working Men's College, will consist of five classes of members:—1. Ordinary students. 2. Certificated students: those who have gained at least one certificate in some subject, as algebra, Latin, &c. 3. Scholars: those who have passed a satisfactory examination in one branch of study, as mathematics, physics, &c. 4. Associates: those who have gained two certificates, and also passed a satisfactory examination in Bible history, English history, arithmetic, and English grammar. 5. The council, or governing body of the college. It is hoped that every alternate vacancy in the council may be filled by the election of an associate. Professor Huxley, the principal of the college, will deliver the inaugural address to-morrow evening.

ASSESSMENT OF GAS AND WATER-WORKS.

THE important question of the proper rateable value of gas and waterworks has recently arisen with respect to the works at Nottingham. Notwithstanding the extension of the two establishments in this town from time to time, the amounts at which they have been assessed to the poor rate have for several years remained stationary, the companies maintaining that they were assessed at their full value, whilst the parochial authorities believed them to be considerably underrated. Mr. J. S. Norris, of Nottingham, was therefore directed on behalf of the parish (St. Mary's) to value the works of the respective companies, and the result was that he returned the rateable value of the gasworks as £4,286 instead of £2,700, the old amount, and that of the waterworks as £4,927 instead of the old amount of £1,550, the valuations being made under considerable difficulty, owing to the companies refusing the parochial authorities access to and information concerning any of their works other than those in the respondent parish. Against the new assessment the two companies appealed to the Court of Quarter Sessions, but eventually both parties agreed to refer the matter to and abide the decision of Mr. Serjeant Hayes, of the Midland Circuit. The two cases accordingly came on for hearing before that gentleman in London, when Mr. Field, Q.C., and Mr. Cave, of the Midland Circuit, instructed by Messrs. Hunt and Son, of Nottingham, solicitors to the Gas Company, and by Messrs. Freeth, Browne, and Rawson, of Nottingham, solicitors to the Water Company, appeared for the appellants; and Mr. Keane, Q.C., of the Norfolk Circuit, and Mr. Guise, of the Oxford Circuit, instructed by Mr. Cann, solicitor of Nottingham, appeared for the respondents. Evidence was given in support of the companies by Mr. T. Hawksley, C.E., Mr. T. G. Barlow, C.E., and Mr. H. A. Hunt, surveyor, all of Westminster; and Mr. Norris's valuation was supported by Mr. H. J. Castle, surveyor, of Chancery-lane, London, Mr. Jno. Higginbottom, surveyor, of Longton, Staffordshire, and Mr. Westcott, accountant, of Coleman-street, London. After several protracted hearings and repeated adjournments, the learned arbitrator has at length made his award, fixing the rateable value of the gasworks in the parish at £3,020, and that of the waterworks at £3,740, being an increase upon the old rateable values, in the gas case of £320, and in the water case of £2,190. The cases were strongly contested throughout, but the chief points of contention were the proper per centages to be allowed to the hypothetical tenant in respect of the three items of interest on tenant's capital, trade profits, and risks and casualties, the companies claiming under the three heads respectively, 5, 25, and 2½ per cent., whilst the parish admitted only 5 and 10 per cent. under the two first-named items, and ignored the last. Reference was made in the course of the arguments to various leading cases, particularly that of the parish of Lee *v.* the Phœnix Gas Company, decided by the Court of Queen's Bench in the early part of the present year.

CORK SCHOOL OF ART.

A VERY favourable report was presented at the annual meeting of the Cork School of Art, held the other day. The total number of students who have received instruction was 364, being an increase of 22 on the preceding year. Of this number, 182 students attended the classes at the central school, the remainder, consisting of national school and other children taught either in the evening classes at the central school, or in their own schools, by pupil teachers under the supervision of the Institution. At the Government examinations in freehand drawing, geometry, perspective, model, and mechanical drawing, twenty students were successful, and four, having passed in all the subjects, received certificates of the second grade. At the last examination of drawings sent up by the school to South Kensington, the works of eleven students were marked satisfactory, six students received prizes, two received honorable mention, eleven students had their works selected for national competition, and one student received a Queen's Prize for art.

A NEW STYLE.

MR. ANDREW DEWAR read a paper before the Edinburgh Architectural Association, on the 26th ult., on "The Degeneracy of Architecture in Britain, and What Ought to be Done by Architects to Obtain a True British Style." After glancing at many matters connected with the history of architecture, he gave his opinion on a new style.

Having said he had shown that the styles practised in Great Britain are not national, and that they are altogether unworthy of the high position which our country occupies in the other arts and sciences, I now proceed to consider what ought to be the British style. For the sake of clearness I will divide it into three parts.

1st. Ought it to be a new style?

2nd. Ought it to be Gothic or Pointed architecture?

3rd. What ought it to be?

Firstly. Ought it to be a new style? In the same respect as Grecian, Roman, and Gothic are distinct styles, and as each in their day were new styles, I emphatically say that British architecture ought to be a new style. In a strict sense no style is absolutely new, because every style has copied and borrowed from those that preceded it; and no style could be invented with absolutely new forms. All styles that have ever existed in any age or in any country are all branches of the one great tree, or reversed tributaries of the one great river of architecture, which, flowing through all countries and climes for hundreds and thousands of years, had its source and spring in mythological Egypt. If, then, new and distinct styles have been developed from the Egyptian and others that followed it, I see no grounds for supposing that these styles are now so barren that others may not be developed from them, and no reason why in the lapse of ages, when the new British style has run its course and been perfected like the others, that another new and entirely distinct style may not by succeeding generations ever be developed from it. "No nation," says Mr. Ferguson, "in any age or in any part of the globe, has failed to invent for itself a true and appropriate style of architecture, whenever it chose to set about it in the right way, and there certainly can be no great difficulty in our doing what has been so often done before, if we only set to work in a proper spirit, and are prepared to follow the same process which others have followed to obtain this result."

Secondly. Ought it to be Gothic or Pointed architecture? Although it may be unnecessary to answer this in the negative, seeing that I have so fully expressed my opinion in the former part of my paper, yet I desire to fathom it thoroughly, and to give the opinions of others than myself, because on it all objections will principally be based.

Do we require those large cathedrals in which Pointed architecture reached its perfection? No. As Mr. Christie said, in a lecture before the Architectural Institute in 1863, "Our religion has ceased to be processional, and the long-drawn aisles, with their attendant naves and transepts, are no longer required. What is wanted is a place where all may hear and see, so that they may unite without difficulty in the sung and spoken prayers and thanksgivings, and hear perfectly the words of exhortation addressed to them by the preacher." If, then, we cannot erect those forms in which Gothic reached perfection, and in which only it is seen to the greatest advantage, and if the distinctive feature of vaulting has been almost entirely done away with, and the other distinctive feature of buttresses must also die with it, why should not we, as the mediæval builders did, invent new construction for every new requirement, and as these requirements necessitate a different shape and appearance of building, why should not we, in the spirit also of our ancestors, develope a new style altogether, which in its completed form would be a worthy rival to the Gothic, instead of erecting buildings in the old style, which, even in the grandest efforts, could never be anything more than mere shadows of the old cathedrals.

It is admitted, by some upholders of Gothic, that it is not suited for churches of the Presbyterian form of worship, and that it would be debasing it to use it for such forms and buildings that it was never intended for; and, certainly, the interior of not a few United Presbyterian churches in Edinburgh testify that this statement is correct. It is also admitted, that, although no style is better suited for a church standing alone in an open space of ground, where all the attention is confined to the building, and there is nothing in the surroundings to distract it, where the arches and leading forms are all pointed and aspiring, leading the eye gradually upwards from the doors to the windows, from the windows to the gables, from the gables to the pinnacles, from the pinnacles to the tower, and the tower to the spire, till at last the eye is lifted far beyond the earthly tabernacle below to Him in whose honour it has been raised in the deep blue zenith above; yet, it is not so well suited for street architecture as the Roman, where the eye is not wanted to be led upwards, but onwards, along the vast panorama of houses and shops, leading the eye pleasantly along the continually diminishing lines of cornices and windows, till they all hazily converge in a point of dreamy infinitude. If it is, then, admitted that the generally received opinion of Gothic, promulgated by Ruskin and others, that it is the best suited for every kind of building, is untrue—that it is not the best suited for Presbyterian churches or for streets—then, if we can introduce a style of architecture that is better suited for these, all opposition to that style must necessarily vanish. Mr. Ferguson, in his "Handbook of Architecture," says that we pulled down old London-bridge without regret, because we knew we could replace it by a better; and if we were making the same progress in church building as we are making in bridge building, then we would "pull down a Gothic cathedral with the same indifference, content to know that we could replace it by one far nobler and more worthy of our age and intelligence."

The question then remains, in the third place, what is this British style, or what ought it to be? We hear some people say, show us a specimen of your British architecture that we may judge of its superiority. Now, such a question at the present time is absurd, and shows a narrow mind. When the Gothic was forming, if the same question had been asked regarding it, it would not have given a fair idea of what Gothic was to develope itself to, if such a building as the iron church had been cited as an example. Comparison cannot be formed between a style existing and thoroughly developed and one that is merely growing. We cannot compare the Parthenon with the Iron Church, but the Parthenon with Cologne Cathedral. So, also, we cannot compare a Gothic cathedral to any building in the British style that might be designed at present. Enough it is for us to show that there was once a time when there were no Gothic cathedrals, and that it would be no absurdity to infer, that, with the greater skill, science, knowledge, and examples which we possess, another style could be perfected equal in every respect to the Gothic. No man ever did and no man ever will invent and perfect a style, for it must grow and develope with the nation's growth and development, till they both reach perfection. What I throw out are merely suggestions to be added and improved upon by others. My own opinion is that it should be a development of our own Saxon and Norman styles, a kind of Romanesque, yet I would decidedly refrain from calling it Romanesque, but stamp it at once as British. Then, even as our language began with Saxon and went on increasing in power and force, now borrowing from the melodious Greek, the sounding Latin, the refined French, and the expressive German, till in the lapse of centuries it has reached that perfection which it has now attained to, a language as rich, as powerful, as melodious, and as expressive as any in the world. So, also, I have no fear that our architecture would be as complete a success, if we go back to the same early days, and take the same early Saxon and Norman architecture, if we avoid their faults and develope only their good parts, if we go on growing and increasing, now borrowing from the massive and impressive Egyptian, the simple and symmetrical Grecian, the grand and noble Roman, and the aspiring and magnificent Gothic, not leaving all we borrow as we find it, but thoroughly engrafting it and suiting it to our climate, our tastes, and our wants, until it becomes an unmistakable part of British architecture. In order to satisfy those who must have a specimen of British architecture, I cite Dalmeny Church as surpassing by far any similar building of its size in Pointed architecture, for homely simplicity and quiet impressiveness; and I have no doubt that a church in the British style, in its most perfected form, will surpass by far any British or Continental Gothic cathedral, if not in beauty and loveliness, at least in that which is the characteristic of our own Highland hills and scenery—sublimity and grandeur.

DEATH OF BARON MAROCHETTI.

THE "Pall Mall Gazette" of last night announces the death or Baron Marochetti, which, it appears, took place in Paris on Saturday last. The deceased sculptor was in his sixty-third year, having been born at Turin in 1805. He received his education in Paris at the Lycée Napoleon, after leaving which he was placed with Bosio, a Parisian sculptor of some eminence. While studying in his atelier he obtained honourable mention from the Ecole des Beaux Arts, but was not awarded any other distinction, and his journey to Italy to complete his studies was undertaken at his own expense. In the year 1827, he returned to France, and in the same year exhibited a group, "A Girl Playing with a Dog," for which a medal was awarded him. This group he presented to the King of Sardinia. In 1831, he exhibited his "Fallen Angel," and somewhat later he executed for the Academy of Arts at Turin a statue of Monsignor Mossi. He presented to the capital of Sardinia an equestrian statue of Emanuel Philibert, which was his sole contribution to the French Exposition of 1855. Shortly after the revolution of February, 1848, Marochetti came to England, where he soon became known. In 1851, he contributed the model of a colossal equestrian statue of Richard Cœur de Lion to the Great Exhibition, but dissatisfied with the position allotted to it inside the building, he set it up at some distance from the western entrance to the great palace of glass. The position of the figure and its spirited attitude attracted no small share of public attention, and this model was the means of bringing the sculptor into very general notice. The statue was afterwards executed in bronze, and placed close to the Palace at Westminster, the cost being defrayed by a public subscription. The people of Glasgow commissioned him to execute for them an equestrian statue of the Queen, which was "inaugurated" in 1854. In 1856, he executed the granite monument to the memory of the English soldiers slain in the Crimea, and a year later the mausoleum of the Princess Elizabeth, daughter of Charles I. He also executed a statue of the Duke of Wellington, which now surmounts a huge monolith erected to his memory not many months since at Strathfeldsaye. One of his most recent works has been the monument to Lord Clyde, which stands in Waterloo-place. He was also engaged on a monument to the Duke of Wellington, to be erected in St. Paul's Cathedral. He was made a Chevalier of the Legion of Honour in 1839.

Building Intelligence.

CHURCHES AND CHAPELS.

On the 17th ult., the little church of Latimer, near Chesham, was reopened by the Lord Bishop of Oxford. Built about twenty-five years ago by Mr. Blore, it had become altogether insufficient for its purpose, and it has been accordingly greatly enlarged, under the direction of Mr. G. Gilbert Scott.

On Sunday last, Bishop Wordsworth opened St. James's New Episcopal Church at Cupar. The space occupied by the old church has been divided transversely into a nave and aisle, and a chancel has been erected on ground to the back. The nave measures 54ft. by 21ft. 6in., and is divided into three bays by moulded stone semicircular arches, and pillars with floriated capitals. The aisle is 10ft. wide, and the chancel 17ft. by 23ft. The church will accommodate 190 seated in open deal benches, exclusive of the choir. Mr. Anderson, of Edinburgh, was the architect.

A new font for the parish church of Louth has just been designed by Mr. S. F. Bodley, architect, and executed in alabaster by Messrs. Riley and M'Dougald, of that town. Its forms is an octagon. On each angle under the font is an angel bearing a scroll. On four of the panels of the font itself is a subject taken from Scripture, having reference to the Sacrament of Baptism, the Temptation, the Ark on the Flood, the Baptism of Jesus in Jordan by St. John the Baptist, and the Crucifixion. In the intermediate panels are typical subjects.

The foundation stone of the new church of St. Paul, Old Brentford, was laid on Monday by the Princess Mary of Teck. The church is designed to meet the requirements of a large and increasing neighbourhood.

The old church of St. Mary Arches, Exeter, is in course of restoration, under the direction of Mr. Hayward, architect, of that city. The building dates from the eleventh century, and the columns separating the aisles from the nave are pure Norman. The present walls and windows are much more modern, being Perpendicular. There are several fine monuments in the church. A heavy reredos of the seventeenth and eighteenth century is to remain, though somewhat out of keeping with the general character of the building.

A new Roman Catholic church has been opened at Preston, dedicated to the English Martyrs. Mr. E. W. Pugin is the architect. The church measures 120ft. long and 60ft. wide, and the height of the nave is 30ft. It seats 850 persons, at a cost of £8,000. The altar carving was executed by Mr. Earp, of London.

The Wesleyan chapel, Keighley, Yorkshire, has been thoroughly painted and decorated, and it is said that the effect has been heightened by the introduction of very handsome inner windows of ground glass, transmitting a soft diffused light over the whole, which assists in producing a peculiar bloom or haze of colour, aimed at in this scheme of decoration. Messrs. Forster and Andrews, of Hull, have just erected a magnificent organ in the chapel. The whole of the decorations have been carried out by Messrs. S. Bottomley and Sons, of Crosshills.

St. Alexander's Roman Catholic Church has been opened at Bootle. The style is Gothic. Mr. E. W. Pugin is the architect, and Mr. W. Glasser the contractor. The length of the building is 108ft. by 50ft. wide, and 53ft. high. The decoration of the roof and ceilings is very good.

The church of St. Bartholomew, Dublin, which has been erected from the designs of T. H. Wyatt, Esq., was consecrated on Monday, December 23, by the Archbishop of Dublin. It is somewhat original in plan, having double transepts to the nave, and a tower rising over the chancel, the lean-to aisles of which form the organ chamber and vestry. There is accommodation for nearly 600, all the sittings being entirely free and unappropriated. The church has cost about £6,000, but it will need £1,000 more to complete the spire, purchase the organ, &c.

All Saints' Church, Hoole, was opened on Tuesday week. The style is Transitional—that immediately preceding the Decorated. It is built of the red sandstone of the district. Mr. Dankes, of Whitehall-place, is the architect, and Mr. Hughes, of Aldford, the builder. The church will seat 600 persons at a cost of £3,235. A spire has yet to be added.

BUILDINGS.

A handsome fountain has been ordered by Her Majesty's Government for the public gardens at Hong Kong. The ground basin is a quarterfoil with square projections. All the ornaments are designed from water plants. The middle basin is also a quarterfoil supported on four columns ranging around a central pier. The shaft is a pointed quarterfoil with tufts of ferns at its base, and the cap is composed of a collection of water plants, and the under side of the upper basin of shells and leaves. The ground basin is 18ft. in diameter, and the height of the fountain 18ft. The design is by Mr. Thomas Blashill, and has been executed in Ransome's patent concrete stone.

A portion of the Corporation buildings in Sauchiehall-street, Glasgow, has been converted into picture galleries by Mr. Heath Wilson and Mr. David Thomson. There is a handsome entrance hall for sculpture, a gallery 80ft. in length, two square halls, and two smaller rooms—all suited for the exhibition of pictures, and lighted from the top. The Corporation intends to inaugurate the new galleries by a portrait exhibition, limited to portraits of Lanarkshire people who have been eminent in connection with the county during the last century and a-half.

On Thursday week the new infirmary and general hospital recently erected in Sunderland was opened by Earl Vane. The new building has been rendered necessary in consequence of the limited character of the old hospital, which is capable of containing only thirty-three beds, while the present one has been constructed to hold one hundred beds. The new institution is built on the pavilion principle, in the form of the letter H. Each ward will contain twelve beds. The rooms are 52ft. long, 23ft. wide, and 16ft. high. In the planning of the building, the architects, Messrs. Potts and Son, were assisted by the medical gentlemen of the town, and visited the most recently erected hospitals in the kingdom, for the purpose of introducing every improvement in hospital construction. The building is plain in appearance, but most commodious. The total cost will be nearly £20,000.

Baron Ferdinand de Rothschild laid, on Tuesday last week, the foundation stone of an edifice that will, when completed, be known as the North London Synagogue. The site of the new building is one of the unbuilt-on pieces of ground in Barnsbury, Islington. The building is roofed and far advanced towards completion. It will be in the Italian style. The dimensions of the synagogue proper is 65ft. by 45ft., and 35ft. high. It will be approached from a portico, which will be ascended by a wide flight of three steps. A large stone staircase adjoins the vestibule, and leads to the ladies' galleries, retiring rooms, and lavatories. Accommodation will be provided for 700 persons. The cost, it is anticipated, will be about £5,000. The architect is Mr. H. H. Collins, and Mr. W. Henshaw is the builder.

A new rectory house has been built, and other improvements effected at Sandford Orcas, Somerset, from the design and under the superintendence of Mr. J. H. Colson, architect, Shorborne, Dorset. The cost was partly defrayed by a loan from the Bounty Office.

On Thursday last week the new General Hospital, Sunderland, was formally opened by the Hooourable Earl Vane, assisted by the Mayor, members for the borough, and other gentlemen. A fancy fair or bazaar was held on the occasion; also the show of the Ornithological Society, in which about 1500 birds were exhibited; the whole of the proceeds is intended for the building fund. The architects for the new erection is Joseph Cotts and Son, under whose immediate superintendence the works have been carried out. The contract has been let for the boundary enclosure walls, gate piers, entrance lodge, and dead house to Walter Scott, contractor, for £1,204; and the contract for gates and iron railings to Messrs. Glaholme and Robson, of the Phoenix Foundry. The building will be opened for the reception of patients in April next.

The plans of Mr. Bates for a Sessions House, Town Hall, Magistrates' Court, and Public Offices at Wolverhampton have been formally voted in the town council, and tenders will be advertised for. The estimate of Mr. Bates that his plans could be carried out for £17,000, was, it is said, guaranteed by Messrs. Warburton, builders and contractors, at Manchester.

The new town hall at Guisley was opened on Thursday week. The building stands on a site of 1,200 yards of land. The arrangement in the building for the local government offices consists of a board room, clerks' offices, fire engine room, lamp room, &c. The public lecture room is is 65ft. long, 36ft. wide, 27ft. high, and will accommodate upwards of 800 persons seated. The building has cost about £3,000.

WATER SUPPLY AND SANITARY MATTERS.

The works for brioging the waters of the Vannes to Paris are to be immediately commenced. The estimated cost is £800,000.

The works for bringing the waters of the Vannes to Paris are about to be commenced. The course is through the department of the Yonne, and the great reservoirs are at Montrouge, whence they will be distributed in Paris, on the left bank of the Seine. The cost of the undertaking is estimated at 20,000,000f.

DUNDEE.—The new waterworks at Dundee are nearly completed. The reservoir is situated in the valley of Crombie Den. The embankment is about 550ft. long, and is of a most satisfactory character. The great pond at Monikie holds 280,000,000 gallons; the north pond 175,000,000 gallons; the clear water basin 42,000,000 gallons; and the Stobswell reservoir at Dundee 5,600,000 gallons; and the new reservoir in Crombie Den will hold 200,000,000 gallons—or three months' supply of water for the town of Dundee. The engineer of the new works is Mr. Leslie, of Edinburgh, Mr. W. Gibb being resident engineer. The contractors for the construction of the reservoir are Messrs. Alexander Wilson and Son, Granton.

STAINED GLASS.

Mr. T. Dury, of Warwick, has just placed a stained glass window in Mr. Dugdale's mansion, near Wroxhall Abbey, illustrative of Hugh de Hatton, as described in Dugdale.—A three-light window, representing the good deeds of Dorcas, and subscribed for principally by mites of the poor, has been placed in the west end of All Sainte' Church, Embscote, Warwickshire, by Mr. Dury, of Warwickshire.—The principal west window of the fine old church, West Tanfield, has just been furnished with stained glass by Mr. H. M. Barnett, of the Victoria Stained Glass Works, Newcastle-upon-Tyne. The subjects represented are the "Resurrection," "St. Paul and Elijah the Prophet."—In the late storms in the North Sea four painted windows for Glasgow Cathedral have been lost. Considerable progress has been made in the erection of painted windows since we last noticed the state of these works. Two windows for the crypt were also on board the "Vienna," and as they have been for a considerable period in the hands of the artist, the loss will be much felt. The drawings, however, exist, and the windows will be re-commenced.

The Edinburgh Improvement trustees have resolved to borrow £50,000 in such sums as may be found convenient, to enable them to carry on the improvements during the present year.

TO CORRESPONDENTS.

TO OUR READERS.—We shall feel obliged to any o our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p m on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

FIRE AT HER MAJESTY'S THEATRE.

To the Editor of the BUILDING NEWS.

SIR,—Since the fire which destroyed Her Majesty's Theatre there has been much discussion as to the means to be employed to meet such disasters. Most of the suggestions made apply simply to the treatment of a fire after it has broken out, and pass by all measures of prevention. It seems now to be the fate of a theatre once to be burnt down, but this I think need not be, if the ordinary resources of modern science and skill were applied as a preventive machinery. I will trouble you, as the subject is of great importance, and has a relation to all public buildings of whatever kind, with a few remarks dictated by my own experience.

I happened to be on the jury summoned to inquire into the fire which last destroyed Covent Garden Theatre. It will be recollected that there were some vague suspicions of foul play, and that the churchwardens of the parish of St. Paul's Coveut Garden, took advantage of a statute which remains in force, but which has grown into disuetude, to make the matter one of judicial iuquiry, by bringiug it before a coroner's jury. The jury met several times, and every exertion was made to trace the cause of the fire, but the mire was so complete that the inquiry was defeated, and they were compelled to bring in a verdict to the effect that the fire arose from accident, but how originating they could not ascertain. This is the case almost universally, as in such buildings the progress of destruction is so rapid, and the flames soon became so ungovernable, that access to any part of the premises is impossible. During the investigation it was suggested that the jury should visit the neighbouring theatre, Drury Lane, during the hours of performance. We were assured that the two theatres were managed in much the same way in all respects, and especially in the precautions taken in case of fire. Very little was elicited by this visit beyond the opinion that if a fire broke out in Drury Lane the devastation would be as rapid and complete as it had been in Covent Garden, and that little or nothing could be done to meet the progress. The quantity of gas consumed dries the scenery and woodwork almost to a state of tinder, and as the carpenters' shops and scene painters' studios contain a quantity of combustible and inflammable matter, the building is always very hazardous.

In reference to Covent Garden the probable conjecture was that the intense heat arising from the performances being continued for a day and throughout a night had ignited a quantity of waste matter, which spread with such fierceness and quickness as to leave the spectators barely time to escape. Very probably if the fire had burst out a few hours before there might have been a serious loss of life added to the loss of property.

What struck me the most during the inspection of Drury Lane was the want of a preventive service. After the destruction of the Surrey Theatre and of the Edinburgh Theatre, both of which followed in a comparatively short space of time, I made it my business, on a visit to Paris, to make myself acquainted with the means adopted in that city in similar cases, and I found that although their fire brigade, and all the machinery used by the brigade, are not superior, and, in many cases, not equal to our own, that in one point they greatly excel us, and that is in the means of prevention adopted. They seem to have arrived at the conclusion that it is of little use to make attempts to stay a fire in one of these buildings, but that it is easy to prevent it breaking out. A preventive policy in relation to any evil is one that in this country we are slow to learn, but I submit that if carefully considered plans were adopted we might make our theatres as safe as any other class of public buildings.

In Paris all the theatres are compelled as a condition of licence to maintain a small fire brigade within the theatre, under the control and direction of the central office. The strength of such brigade varies from three or four men to seven or eight, according to the size of the theatre and the requirements of the case. It is the business of these men to perambulate the theatre both day and night, especially during the hours of performance. Their visits at the appointed places and hours are registered by tell-tales. They have every appliance, in the shape of sponges affixed to poles, wet blankets, buckets, and syringes, in case of accident; and in the larger theatres a fireproof room, from which they can play upon the fire, if such should break out; and the system of alarums makes known to the men in what part of the building their services are required. These men have dormitories in which they sleep; but, beyond all this, it is their business in their daily rounds to see that no useless matter of any kind is allowed to remain—that all waste be destroyed or removed, and that combustibles of all kinds be secured, so as not to be exposed to the action of heat or light. Nothing is permitted to remain but what is absolutely necessary and safely guarded.

I would suggest to all whom it may concern that they should become thoroughly acquainted with what our Parisian neighbours are doing in this respect. I believe that a few men, disciplined as our firemen are, and under the direction of Captain Shaw, placed in the large theatres of the metropolis, with special instructions that their business is first to take care that fire does not break out; and, secondly, in case the insidious enemy escapes their vigilance, to be armed with all the appliances necessary, would have prevented the destruction of Her Majesty's Theatre. There is a period in the history of every fire where a bucket of water properly applied would extinguish it, and the true policy is to adopt such arrangements as will prevent the flames from becoming unmanageable, if care and watchfulness do not prevent their breaking out.—I am, &c.,

B.

HONOUR TO WHOM HONOUR IS DUE.

SIR,—In the criticisms of works in the Paris Exhibition, which appeared in your last week's journal, mention is made of Fourdinois' celebrated oak cabinet as "one of the most perfect objects, combining art with manufacture, which the Exhibition contains." In my estimation it is of unrivalled excellence. But who is the author? Has anyone heard the name of the artist who executed this lovely work? To the credit it is of manufacturers that they employ first-rate talent, and doubtless they find their advantage in it. But justice requires the claims of the artist should have recognition. He it is should have the glory. I hope in future exhibitions this will be borne in mind. A commencement of better things has been made in the case of M. Morel, whose genius reflects so much lustre on the firm of Elkington.—I am, &c., P. E. M.

It is well known that, under the influence both of the hammer and of constant use, the particles of iron gradually assume, by repeated vibration, a different texture from that they had when the piece was new. The metal becomes crystalline, loses its tenacity, and gets brittle. The sudden breaking of old iron axle-trees on railways is exclusively owing to this cause. Now, it would be of the utmost importance to find some means of ascertaining whether or not this alteration in the texture has taken place; but up to this time every attempt in this direction has been a failure. We now learn that this problem has been solved by Mr. Sarboy, an Englishman, who has thought of employing the magnetic needle for this purpose. It appears that when an iron bar is homogeneous, the needle will not be suddenly displaced from its position on being slowly moved to and fro in a direction perpendicular to the magnetic meridian of the locality; but if there be in the bar any unsound place, a fault or flaw, the oscillations of the needle will become very intense as it passes over these defective points

Intercommunication.

QUESTIONS.

[702.]—GREENHOUSES.—Can any one inform me of the best way to heat and ventilate a small greenhouse?—A. B.

[703.]—CRACKED BOILER.—I have a cast iron oval flue boiler with which I heat a small greenhouse. The boiler is cracked at the bottom, next to the fire. Can any one help me by suggesting a remedy? I should also like to know what is the best kind of cement for the joints of hot-water pipes.—A. B.

[704.]—COMPOSITION FOR FLOORS.—Could you kindly suggest what you think the best composition for malt barn floors, that is, of a kind to be durable under the constant turning up by the shovel of the grain, not liable to crack, or scale up in layers or patches, but of a homogeneous character and of a kind to promote the ripening or growth of the grain, suitable for malting purposes? Perhaps the matter is fully better understood in England than Scotland.—G.

[705.]—POSITION OF THE FONT IN A CHURCH.—In the small church of Milverton, near Leamington, Warwickshire, the font is placed inside the communion rails. I should like to know if this is the case in any other church. I have never seen it elsewhere. Milverton Church is also remarkable for its wooden tower, and very low-ceiled roof.—E. GUIS.

[706.]—HOROLOGICAL.—I see in your list of meetings for the week you mention, amongst other societies, the Horological Society. I should esteem it a favour if you would give me some information about it.—A BEGINNER.

[The Institute was established to promote the science of horology, by making known to the whole trade the laws on which the present methods of manufacture depend, and the direction in which invention must run in pursuit of increased perfection.

It consists of members who pay an annual subscription of 12s., or a half yearly subscription of 6s. Annual or half-yearly members residing beyond the twelve miles circle, one-third less. The apprentices of members are admitted to the reading room and the use of the library, and also to the meetings, at the rate of 3s. per annum.

It offers to its members—1. The use of a library in course of formation, and a reading room supplied with periodicals and papers. 2. Periodical meetings for conversation and discussion on all subjects having reference to the art of horology. 3. The reading and hearing original papers and lectures on horological and scientific subjects. 4. The use of a collection of models, drawings, &c., also in course of formation. 5. A monthly illustrated journal, delivered free to each member, containing matter interesting to those engaged in watch and clock making, and to which all are invited to contribute either letters, extracts, or original papers. 6. Country members, in addition to the journal and the free use of the library, reading room, models, &c., during office hours when in town, have the privilege of addressing their correspondence to the office of the Institute, to be kept for them or transmitted. 7. The exhibition of specimens of workmanship, tools, or instruments connected with the art.

The hours of attendance are—Museum, library, and reading room open from 7 to 10 p.m., except on Saturdays. Office hours, from 3 till 8 p.m., on Saturdays from 3 till 5. Further information may be had of John Moore, resident secretary, 35, Northampton square, Clerkenwell, E.C.]

[707.]—MILDEW IN ROOMS.—I shall be glad if you, or some of your correspondents, can give me some effectual remedy for the cure of mildew in rooms. In damp situations the consequences are, I believe, serious, and I am anxious to avoid them.—L. S.

[708.]—GOOD GOTHIC.—An interesting discussion appeared in "Intercommunication" a short time ago on periods of Gothic architecture: I should like to see a similar controversy on the best kinds of Gothic, and its distinguishing characteristics.—W. R.

[709.]—WROUGHT IRON ROOFS FOR WORKSHOPS, SHEDS, &c.—A few weeks since you gave some illustrations of wrought-iron roofs for workshops, sheds, station buildings, &c., and you gave some information about "galvanized corrugated iron, of from No. 16 to 20 gauge, the sheets to run from purlin to purlin, &c." A little more detailed practical information on the different gauges and the manner of laying will oblige.—A COUNTRY BUILDER.

REPLIES.

[688.]—FLOW OF WATER IN PIPES.—

$$v = 110\sqrt{RS} - 11\sqrt[3]{RS} \text{ (Nevill's formulæ)}$$

$$R = \text{hydraulic radius (for pipes)} = \frac{\text{diameter}}{4}$$

$$S = \text{sine of the inclination of pipe} = \frac{\text{total fall}}{\text{total length.}}$$

Then for an 18in. pipe, with a fall of 9½ft. and the length of the pipe 1 mile or 5,280ft., we have

$$v = 110\sqrt{\frac{1\cdot5}{4} \times \frac{9\cdot5}{5280}} - 11\sqrt[3]{\frac{1\cdot5}{4} \times \frac{9\cdot5}{5280}} =$$

$$110\sqrt{\cdot375 \times \cdot001799} - 11\sqrt[3]{\cdot375 \times \cdot001799} = 2\cdot6711 \text{ feet}$$

per second velocity.

This multiplied by the sectional area of the pipe will give a discharge of 4·72 cube feet per second, which being multiplied by 60 will give a discharge of

283·2 cube feet per minute.

The above formulæ is for long straight pipes.

Where pipes are less than 1,000 diameters in length, a correction must be made for loss of head due to friction and form of orifice at the junction of the pipe with the reservoir—

$$h = C\,v^2$$

h = loss of head in feet.
v = velocity in feet per second.
C = ·0234 for round orifices.
= ·0155 do. when bell mouthed.
= ·0303 do. when the pipe projects into the cistern.

FRICTION OF BENDS.—Where there are any bends a correction must be made for loss of head due to their resistance—

$$h = V^2 \times \text{sine}^2 \times \text{No. of bends} \times \cdot0003.$$

h = loss of head in inches.
V = velocity in inches per second.

The value of h for loss by bends and for loss by friction in short pipes must be deducted from the total head, and the velocity and discharge calculated from the reduced slope.

Beardmore, in his Hydrology, gives the following formulæ for the discharge of water through pipes:—

$$q = 2356\,\frac{\sqrt{d^5}}{\sqrt{\frac{l}{h}}}$$

d = diameter of pipe in feet.
l = length do.
h = head do.
q = discharge in cubic feet per minute.

Taking the length, fall, and diameter of the pipe as before, we have—

$$q = 2356\,\frac{\sqrt{1\cdot5^5}}{\sqrt{\frac{5280}{9\cdot5}}} =$$

275¾ cube feet per minute.

—A. SCARGILL, Sheffield, Dec. 26.

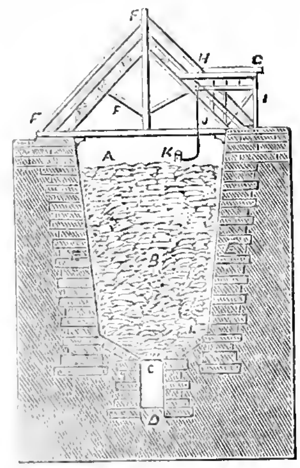
[690.]—GAUGING WATER.—

$5 \cdot 1\sqrt{h^3}$ = the cube feet per minute of water flowing over a notch or weir of thin iron, 12in. wide.

h = the depth of water in inches flowing over the weir.

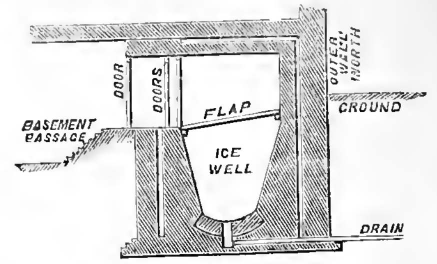
For farther information on the subject consult a work ("Treatise on Waterworks") by Samuel Hughes, published by Weale.—A. SCARGILL, Sheffield.

[698.]—ICEHOUSES.—Considering how easily and cheaply icehouses may be constructed, I have often wondered that one is not attached to every respectable country house. According to Dr. Ure's Dictionary of Art and Manufactures, the simplest and most scientific form is a double cone, that is, two cones joined base to base, the one sunk underground being of stone or brick, and the upper one of carpentry, thatched and pointed at the top. Select a dry and, if possible, a sandy soil, and dig a hole about 16ft. in diameter, terminating below like the point of a sugarloaf. About 24ft. is a moderate depth, but the lower it is the longer it will keep the ice if it is well filled. Slope the ground progressively towards the axis of the cone to prevent the earth falling in. At the bottom excavate a well about 2ft. wide and 4ft. deep, covered at the top with an iron grating to support the ice and let the water drain away. The conical slope must be faced with brick or stonework, about 1ft. thick and jointed with Roman or some other air and water-tight cement. The upper cone may be, as I said, of carpentry or of brick; the latter is, of course, the most durable. An oblong passage into the interior must be constructed. This should face the north, and be at least 8ft. long by 2½ft. wide, and perfectly closed by well-fitting doors, one at each end. A gutter to carry off the rain to a distance from the icehouse should be placed all round the bottom of the conical cover and prevent the ground from getting soaked with moisture. The icehouse should have no window, but be, as it were, hermetically sealed at every point except its cesspool, which may terminate in a water trap to prevent circulation of air. The annexed illustration shows the section of an icehouse constructed according to these directions. Under



the ice chamber A the ice is rammed into the space B. C is the grade of the drain sink D. The portion E E is built in brick or stone. The base L slopes inwards towards the centre of C. The upper part of the brickwork F F is a little way below the level of the ground. The wooden framework F F F F forms the roof, and is covered with thick thatch. G H is the woodwork of the door I. At K is shown the bucket for lifting ice by means of the cord J passing over the pulley M, which enables it to be raised easily.—I. H.

[698.]—An icehouse may be contrived either as a cellar attached to a house or as a separate building. It is generally, though not necessarily, circular, and should be at the north end of the building. The diameter at the top should be from 6 to 10ft., tapering to 3 or 4ft. at the bottom, and the depth about equal to the top diameter. The well should be surrounded by double walls with a space of 6in. between them, and the ceiling should also be similarly constructed. A flap may be provided to cover the top of the well. The entrance should be small and provided with double doors. A trapped drain must be laid to carry off the melted water at the bottom of the well. It should all along be remembered that damp is to be dreaded even more than warmth. The ceiling should be covered with 3ft. or 4ft. of earth, and the connection with the house should be made by an underground passage about 5ft. in length, with double walls and doors. All the double walling should be of brick, as stone is a conductor

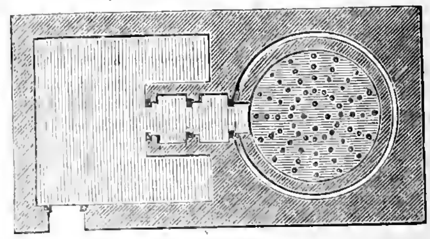


of damp. A coating of asphalte may be used either in addition or to render single walls impervious to damp.—C. E. I.

[698.]—In reply to "W. W.," I send plan and section of an icehouse proposed to be erected in basement floor of a building, inaccessible to light or air, and to be built of brick, rendered in cement.

Fig. 1 shows plan of icehouse, with double wall and

FIG. 1.



opening between to keep it dry. The three doors to entrance are made as close as possible, the space between them being filled with straw, so as to exclude the air.

Fig. 2 shows section of ditto; the floor perforated with

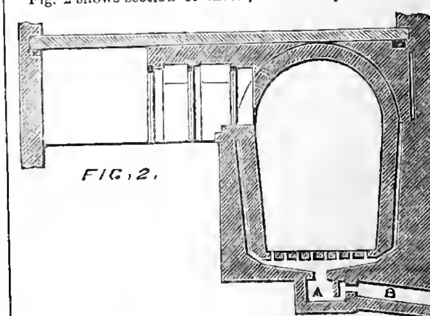


FIG. 2.

holes to let off the water from the ice. A, air-trap from ditto, rendered air and water-tight by a lining of White's cement, or by a metal air-trap; B, drain from ditto. A short ladder to be used to obtain access to ice when low.—L. C. BRIDGMAN, Barum.

[700.]—ASPHALTE PAVEMENT.—In reply to "C.B.O.," the asphalte in Manchester is prepared by melting pitch and adding a sufficient quantity of creosote oil, and boiling both well together in portable boilers until a suitable consistency is obtained, and then poured on while hot, the joints of the sets being previously filled in with clean washed pebbles or shingle and beaten with a beater.—H.R.

[700.]—Your correspondent "C. B. O." wishes to know the mode adopted in laying the asphalte pavement in Paris. The method adopted at the Place de la Concorde was this. The ground was made uniformly smooth, either in a horizontal plane or in a gentle slope, to carry off the water; the curbstones were then laid round the margin by the mason, more than four inches above the level of the ground. This hollow space was filled to a depth of three inches with concrete, containing about a sixth part of hydraulic lime well pressed upon its bed. The surface was smoothed with a thin coat of mortar. When the mass had become dry, the mosaic pattern was set out on the surface, the moulds being formed of flat iron bars, rings, &c., about ½in. thick, into which the fluid mastic was poured by ladles from a cauldron and spread evenly over. The asphalte rock is first of all roasted in an oven to render it friable, so as to be easily reduced to powder and passed through a sieve ¼in. square in the meshes. The asphalte is rendered fusible and plastic by bitumen, which is melted in small quantities, and then the asphalte in powder is stirred in to the amount of about twelve times the amount of bitumen. About a bucketful of small gravel, previously heated apart, is next stirred in, and the asphalte is fit for use. It only requires to be poured into the moulds.—W. S. P.

[700.]—In reply to the inquiry of "C. B. O.," in the BUILDING NEWS of December 27, as to the process of forming bituminous roadways in Paris, I beg to inform him that the first essential is a good foundation of concrete. The asphalte employed is a natural rock brought from the Val de Travers, containing a large percentage of the oil of petroleum, and, in consequence, not so valuable an asphalte for ordinary purposes as the quality known as Pyrimont. The asphalte rock having been calcined is in that state, and while hot brought to the work and laid upon the concrete to a depth of 4in., workmen during the process using iron beaters to consolidate it. Finally, an iron roller is passed over the surface to make a perfectly even one, and when quite cold it becomes again the compact rock. It is found slippery during a humid condition of the atmosphere, and on that account, besides the extraordinary general traffic and speed of cabs in London, is not considered a system applicable to the paving authorities to adopt.—A. B., Dec. 30.

STATUES, MEMORIALS, ETC.

The statue proposed to be erected to the restorer of the ancient cathedral of St Patrick, Sir Benjamin Lee Guinness, Bart. (and for which Mr. Foley's model has been approved), is to be placed in front of the southern transept of that venerable pile. The statue will be in bronze.

The "New York Tribune"—perhaps somewhat sneeringly—writes thus of Story's new statue of Edward Everett:—'The statue of Edward Everett, by Mr. William Story, has reached Boston, and been set up in the Public Garden. It is in gold bronze—an exceedingly ugly material, at least when it is new—and of a size considerably larger than life. The Boston people, who ought to know, say that it is no likeness; and all the Boston boys are making fun of the attitude."

LEGAL INTELLIGENCE.

A question of some importance as to the liability of building societies is just now occupying the attention of those interested in their prosperity. Mr. Tidd Pratt has given his opinion on the subject. Being asked:—"Whether members of a society enrolled and certified pursuant to 6 & 7 William IV., cap. 32, can be held or made liable, as shareholders therein, for any debts or engagements of the society," that gentleman said, "I am of opinion that the members of a benefit building society cannot be held or made liable as shareholders for any debt or engagement of the society." If this be true, asks a correspondent, then where is the guarantee or security for depositors who place their money at a certain rate of interest in a building society; and, secondly, what becomes of Mr. Tidd Pratt's legal capacity to give an opinion whereby thousands upon thousands of working men are led into a trap of unlimited liability. When Vice-Chancellor Wood has decided in "*Re* the Doncaster Permanent Building and Investment Society," wound up in Chancery, not only the shareholders who had not borrowed, but also those who had borrowed, had each to pay their quota, and did pay their quota, of the whole debts and liabilities of the society, besides the money borrowed and shares paid up. This society was enrolled under William IV., 6 & 7, cap. 32, and certified by Mr. Tidd Pratt.

Our Office Table.

Mr. Beresford Hope proposes, on the reassembling of Parliament, to call the attention of the House of Commons to the state of buildings possessing archæological or historical interest, in the custody of public departments.

A new alloy of aluminium has been made known in Paris. It consists of one-third silver and two-thirds aluminium, and is said to be harder than silver, and more easily engraved. The new metal is being supplied to commerce at the rate of 38s. per lb.

M. Charles Garnier, architect of the new Paris Opera, has just been elected an honorary member of the Royal Institute of British Architects, which only comprises five or six French members, among whom are MM. Baltard and Dauban.

The demand for local museums of industry and fine arts, which is now so active throughout Europe, has extended to India. The Lieutenant-Governor of the north-western provinces has organized a committee of action for his district, and has laid down the principle that a museum should be established at the head-quarters of each revenue division, and that the chief museum for the north-western provinces should be at the seat of Government. Collections of diagrams and drawings illustrating processes and works on decorative art have been ordered to be sent from England. The main objects of local museums are defined to be—first, the improvement of manufactures; and second, the preservation of ancient and improvement of modern art. An official memorandum states that in order to prevent natives from thinking that European designs were desirable as copies for ornamentation, it would be necessary to procure many modes of illustration from different parts of India and the East generally, and that, "it is not, however, in the modern art manufactures of India that the means can be found to give new life to the native designer. It is in the architecture of the country that power and more original ideas can be found."

Now that Bunhill-fields burying ground has come into the possession of the Corporation, by an act passed last session, we understand that the Corporation will at once set about planting the ground, laying out walks, and preserving the tombstones. The ground will then be thrown open to the public under proper regulations.

The ingenuity and perseverance displayed by some criminals in order to dispel the gloom of their prison life, to some extent at least, are well known. In a new work "Black and White," occurs an interesting account of an American model prison, in which it is stated that a prisoner who was practising the trade of a weaver, had arabesqued the walls of his cell with considerable taste in imitation of Raphael's "Loggia." His colours he had obtained by extracting the dyes from the yarns given him to work with. The decoration of the cell was only half completed when he came out at the expiration of his sentence; but unfortunately before long he committed another offence, was caught, and convicted. He was confined in the same cell, and completed his design. The warder said mournfully it was beautiful, but the colours are fading now. The writer adds that the artist can hardly be expected to come in again to restore its freshness. This prison is built in galleries, mostly of two storeys, radiating from a centre, and covers ten acres. It contained 571 prisoners, each prisoner being in a separate cell.

Several new streets in Paris have been baptized by the names of old masters of French and foreign schools. For instance, two new streets running close to the Pare Monceaux are styled Rue Rembrandt and Rue Murillo; and we have the names of Veronese, Primatrice, Pn. de Champaigne, Mignord, and Isabey scattered in different directions of the town.

There is a likelihood of a strike taking place in the building trades at Chesterfield. Joiners, masons, and bricklayers now work 53½ hours per week. In Sheffield and (the men say) other towns the hours are 55½. They therefore demand a concession of the three hours which make the difference between them and their fellow-craftsmen in Sheffield. They have given notice of their demand, and asked that a compliance with it shall take place on the first week in April next. The masters refuse to make the concession.

A bust, supposed to be of the fifteenth century, and which excited great attention among art connoisseurs in Paris in 1865, was recently purchased at great cost for the Louvre Museum. It now transpires that it is the work of a living artist, and one of those sham antiquities which abound in Europe.

Nitro-glycerine has of late been the cause of so much awful destruction to life and property, that there is a kind of satisfaction in recording the annihilation of so destructive an agent. At all events a quantity of nitro-glycerine reported from Usworth Colliery was destroyed the other day by order of the Gateshead magistrates. The liquid was contained in a wicker covered canister, and was conveyed to a field and a lighted patent fuse was placed in the bung. The spot chosen was away from any human habitation. When the compound fired, a light blue smoke was wafted into the air, followed by a report like the roar of artillery. The ground where the explosion took place was torn and ragged for many yards around, while the top of an adjoining hedge was neatly clipped.

We understand that a gold medal in Class 93, for examples of dwellings characterized by cheapness combined with the conditions necessary to health and comfort, has been awarded to the Metropolitan Association for Improving the Dwellings of the Industrious Classes (Incorporated by Royal charter). An average rate of mortality of 17 per 1,000 has been maintained in the dwellings of the Association for seven successive years, while the average rate of mortality of the metropolis generally has been near 24 per 1,000. This Association has now provided accommodation for 682 families, and 362 single men.

The Californian papers announce new discoveries of asphaltum near Wilmington, Los Angelos county, some of which comprise many acres. A company has of course been organized, and they propose to make thorough tests of the new acquisition, relating to its value as a fuel.

The rapid increase during late years in the number of patents annually granted for new inventions in the United States is something astonishing. The report for the year ending October 1, shows that 2,500 more applications were made this year than last, and over 5,000 more than on any previous year. The whole number of applications was 16,547. Of these, 12,879 were allowed, and 11,655 have been issued—an increase of about 3,000 over last year's issue. During the same time, 3,486 caveats were filed, 96 applications for extensions were received, and 82 extensions were granted.

We have received the enclosed from an architect, who begs us to be so kind as to publish it. We leave out the names this time, but cannot always promise to do so in similar cases:—Sir,—We beg to call your attention to enclosed sample of our patent roofing, which is equally applicable to covering damp floors or walls, and lining temporary wooden buildings. A discount of 10 per cent. will be allowed to members of your profession.—We have the honour to be, your obedient servants, ——— Company.

It is said that one of the most valuable properties in London is likely to become the subject of a lawsuit. St. Katherine's Docks are claimed by an officer in the Indian army, the son of a former Governor of the West Coast of Africa. This officer and a brother were, if the claimant's statement is to be believed, entitled to the fee-simple of the land on which these docks now stand. The brother died during the Indian mutiny, and the survivor now contends that this enormously valuable estate, bringing in £90,000 a-year, is his.

The unfortunate stage carpenters employed at Her Majesty's Theatre at the time of the late calamitous fire by losing their tools lost the means of providing for their families. "We have applied," they say, "to the honorary secretary of the Employes' Relief Fund, and have been told that the sum collected is not ready yet for distribution, and that we must wait; but, Sir, we beg leave to say, what gentlemen call waiting is starving to us, and that could we only get part of our tools to go on with we should feel grateful."

A number of French gentlemen residing in London have conceived and gone far to carry into execution a plan for the formation of a hospital specially devoted to French, Belgians, Swiss, &c., but which will, in fact, be open to the whole resident foreign population. In order to carry out this design, a committee has undertaken to raise subscriptions, and to hire for the present a large building in the centre of the French quarter, which will be fitted up as a hospital. Dr. Genean de Mussy and other eminent French medical men have promised their services.

M. Lenormant, of Paris, has lately laid before the Academy of Sciences the results of his examination and study of a papyrus in the British Museum, hitherto undeciphered. He states it to be the fragment of a curious treatise on surveying. The areas of various regular and irregular figures are computed, as also the cubic contents of pyramids, &c. M. Lenormant conjectures that the papyrus belongs to that period of the twelfth dynasty which would connect it with Solomon's age.

The "Chronique des Arts" tells a curious story, which shows very strikingly to what perfection the art of manufacturing sham antiquities has attained in Italy. In 1864, M. de Nolivos, a French art-collector, bought at Florence a bust of Girolamo Benivieni. It was exhibited in the following year in Paris, where it was pronounced by connoisseurs to be the work of either Mino da Fiesole or Benedetto da Majano (1490—1510.) M. de Nolivos's collection was sold by auction in Paris last year, when the bust excited a lively competition, and was finally secured by the Government, at a large price, for the Louvre Museum.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

1321. J. BALL. MANUFACTURE OF BRICKLAYERS' AND OTHER TROWELS. Dated May 6, 1867.

This invention consists in making trowels of cast, shear, or other steel, rolled and cut to pattern by a machine, and afterwards hammered out to a proper thickness. The plate is cut with the tang and blade in one piece; the tang is then pressed into a hollow or trough-like shape, and

filled in with a piece of malleable or forged iron, which is riveted thereto, and gives the necessary strength to the tang. *Patent completed.*

1326. W. R. LAKE. IMPROVEMENTS IN LOCKS. (A communication.) Dated May 6, 1867.

This invention relates to the construction of a lock which is more especially designed for securing the doors of dwelling houses, and which, by a simple adjustment of parts, will act either as a simple latch opening by a handle on both sides of the door, as a night latch, which can be opened from the outside of the door by the aid of a latch-key, or as a lock or fastening which can only be opened from the inside of the door. The said improvements consist, chiefly, in the peculiar construction of the lock bolt. This bolt is formed in two parts, which are connected or disconnected to effect the various changes in the effect and operation of the lock. One of these parts projects from the case of the locks, and forms the fastening, while the other part which is permanently in connection with the tumblers of the handle forms a retractor for drawing back the said fastening. Each of the two parts of the bolt is forced forward by a separate spring. The said improvements also consist in the combination of the said bolt with an adjustable connecting link or arm and with a cam for operating the same. The said link is pivoted to one part of the bolt, and is formed and arranged to connect and disconnect readily with the other part. The said improvements consists further, in constructing the connecting link with projections or ridges which are formed and arranged to slide through the wards of a split key. The said link may be divided into a number of thin plates or divisions, each of which may be raised independently of the others by differently formed keys. The said improvements further consist in the employment of a swivel, spindle or stem to connect the handles by which the bolt is operated on both sides of the door, and in the combination with the said spindle and bolt of a split tumbler, one leaf of which acts on the fastening or projecting part of the bolt, and the other on the retractor. In this arrangement of parts the rear end of the said fastening is extended and remains permanently in contact with the leaf of the split tumbler, which is operated by the inner handle, but can not be moved by the outer handle till the two parts of the bolt are connected. The said improvements consist, lastly, in the combination of the bolt, link, cam, handle and other parts of the mechanism for effecting the required changes and movements of the lock. *Patent completed.*

1354. H. R. COTTAM. IMPROVEMENTS IN ORNAMENTAL BALUSTERS AND BALUSTRADES, AND OTHER ORNAMENTAL RAILS. Dated May, 6, 1867.

This invention consists in forming ornamental balusters and balustrades of iron bars with grooves in them with overlapping flanges, and into each such groove the patentee slips lengths of ornamental tiles, so as to fill up the grooves from end to end, whereby a highly ornamental effect is inexpensively obtained. *Patent completed.*

1366. S. W. WORSSAM, JUN. IMPROVEMENTS IN MACHINERY OR APPARATUS FOR WORKING WOOD. Dated May 8, 1867.

This invention relates more particularly to that class of machine known as the "Universal Joiner," and consists, first, in the application to such machines of means of apparatus whereby tenons may be completely cut in one traverse of the wood. For this purpose the patentee employs, according to one arrangement, in addition to the ordinary saw or machine spindle, two vertical rotating spindles upon which suitable saws or cutters are fixed, the wood being fixed in a vertical position to a suitable clamp, and passed across a pair of saws on the main spindle of the machine, thereby producing two cuts or kerfs the length of the required tenon; then by continuing the traverse of the clamp, the material is passed between the saws or cutters on the two vertical spindles in such manner asto form the shoulders of the tenons, and allow the cheeks or waste pieces to fall away. The invention consists, secondly, in the application to such machines of means whereby they are rendered capable of producing larger and more perfect mouldings than has previously been the case. For this purpose he employs self acting feed rollers to feed the material up to the cutters, which he places on a cutter block on the end of the machine spindle, the material being fed beneath such cutters on a suitable table by the feed motion above described. The invention consists, thirdly, in the application to such class of machines of means for squaring out and completely finishing the ends of mortices, which are at present left of a semicircular form, on account of the form and action of the cutters by which they are produced, the squaring out (according to the ordinary plan) being afterwards effected by hand. For this purpose he fixes suitable chisels or cutters to the main standard, or other suitable part of the machine, in such manner that, when the revolving tool has done its work in producing the mortice, the material, without removing from its table, is pressed forward on to the chisels or cutters, so as to effect the completion of the mortice, such chisels or cutters being capable of adjustment to different sizes of mortice, and being capable of removal, or of being turned out of the way when not in action. *Patent completed.*

1371. J. BOWDEN. AN IMPROVED "BIB," "STOP," OR WATERCLOSET TAP OR COCK. Dated May 9, 1867.

According to this invention the water is received from the feed or supply pipe in a cup or socket thereon, in which the inventor places a ball of gutta percha or other buoyant material. The outer portion of the said cap or socket is chased or screwed so as to receive a cap or cover, projecting from the side of which is the discharge pipe. At the joint between the socket and the cover is formed a flange, such joint being made perfectly water-tight by means of a ring or washer of india rubber, which ring also forms the valve seating. In the direction of the axis of the feed pipe, and through the cover, is a piston rod, working in a stuffing (or through a second ring of india rubber), the internal end of the piston rod having an enlarged concave end, the other or external end of such rod terminating in a button or thumb piece. The action of the tap or cock is as follows:—On the water entering the feed pipe, the ball in the socket or enlarged end of such pipe is forced against the ring or washer forming the valve seating, the pressure of water on the ball retaining it firmly on its seating until water is to be discharged, when pressure by the thumb on the button of the piston (or by a crank and lever) will, by the other or concave end of piston) remove the ball from its seat, and allow escape of water by way of discharge pipe. Applied to water-closets the button end of the piston will be passed through the seat of the closet, or the seat may be hinged and rest on the button, so as to render the tap self acting: in the supply pipe near the tap or cock, he constructs a syphon to prevent passage of noxious gases to mains when empty. *Patent abandoned.*

Trade News.

TENDERS.

ALFRETON.—For enlargement and restoration of Alfreton Church. Messrs. Hine and Son, Nottingham, architects:—

Johnson and Wright	1,344

BARNET.—For the erection of a detached villa at Barnet, for Mr C. J. Breese. Messrs. Tolley and Dale, architects:—

H and J. Johnston	£1,025
J. Langmead	950
Capps and Ritso	900
Fawcett	875
Ennor (accepted)	823

BISLEY (SURREY).—For the erection of the Boys' Industrial Home, at Bisley, Surrey. Messrs. E. Habersbon, Brock, and Webb, architects:—

Pattman and Fotheringham	£6,589 0
Haynes	6,450 0
Bird	6,380 0
Brass	6,270 0
Newman and Mann	6,237 0
Simpson	6,204 8
Higgs	5,830 0
Manley and Rogers	5,720 0
Carter and Son	5,599 0

CITY.—For alterations to No. 38, Great Tower-street, for Mr. R. S. Meggy. Mr. William Powell, architect:—

Turner	£310
Fisher	300
Wren	268

ELTHAM.—For the erection of four detached villas at Eltham, for Mr. A. F. Timothy. Messrs. Tolley and Dale, architects:—

Fawcett (accepted)	£5,600

HOLLOWAY.—For the completion of two carcases on the Tuffnell Park estate, for Mr. John Taylor. Messrs. Tolley and Dale, architects:—

Keetch and Ambrose (accepted)	£400

HAVERHILL (SUFFOLK).—For the drainage of the town. Mr. B. Fitch, engineer:—

Tinsley and Turner	£1,065 9
Harris	957 0
Moxon	950 0
Dewitt	930 0
Mason and Son	914 0
Faulkner and Cowley	849 0
Bloomfield	840 0
Garwood	795 0
Potter	780 0
Hall	759 0
Fell (accepted)	738 9

HARROW-ON-THE-HILL.—For two houses and shops, for Mr. Wm. Winkley. Mr. W. H. Woodman, architect. Quantities supplied by Mr. T. T. Green:—

Avery	£2,285
Woodbridge	1,920
Upchurch and Hanks	1,912
Taylor	1,910
Lander	1,900
King and Sons	1,860
Baker	1,852
Gibson, Brothers	1,847
Shurmer	1,793
Salter	1,644

LONDON.—For rebuilding Meriton's Wharf. Mr. Richard Bree, architect:—

Webb and Sons (accepted)	£25,000

OXTED (SURREY).—For alterations and additions to the North Lodge, Stone Hall, Oxted, Surrey, for Mr. G. Barker. Messrs. Tolley and Dale, architects:—

Labour and part materials.	
Galyard (accepted)	£52 10

OXTED (SURREY).—For the erection of horticultural buildings, engine house, mushroom house, and sheds adjoining, at Stone Hall, Oxted, Surrey, for Mr. G. Barker, Messrs. Tolley and Dale, architects:—

Weeks	£942 0 0
Knight	918 0 0
Capps and Ritso	833 15 0

SCARRINGTON (NOTTS.).—For building parsonage house and offices, at Scarrington, Notts. Messrs. Jackson and Heazel, architects:—

Gilbert	£1,670
Thompson	1,640
Mason	1,564
Marriott and Co.	1,490
Cooper	1,465
White	1,459
Wood and Sleight	1,450
White and Lamb	1,448
Slim	1,392
Barker	1,382

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

George Latham, Bedford place, Russell-square, engineer, January 16, at 2—George Lyon, Upper Kennington lane, dealer in building materials, January 16, at 11—John Tough, Downham-road, Kingsland, civil engineer, January 16, at 2—William Cooper Wilson, Claremont-terrace, Hackney, builder, January 29, at 12.

TO SURRENDER IN THE COUNTRY.

John Dyson, Rawcliffe, near Goole, bricklayer, January 8, at 12—Isaac Kirkbride, Carlisle, marble mason, January 10, at 11—Robert Marshall, Everton, builder, January 10, at 12—James Parsons, Plymouth, mason, January 11, at 11—John Clarke Teale, New Malton, contractor, January 6, at 11—Robert Bailey, Ipswich, paper hanger, January 7, at 11—Robert Bowden, Monkwearmouth Shore, painter, January 10, at 12—Edward Horrex, Bury St. Edmund's, builder, January 14, at 11—Richard Shortridge, Plymouth, plumber, January 13, at 12.30.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

February 6, J. Watkins, Battersea, builder—February 14, D. Brooks, New-inn yard, Shoreditch, builder—February 14, J. B. Shepherd, Bucklersbury, surveyor—February 6, J. Jowers, Silchester-road West Notting-hill, builder—February 11, W. Orrin, Colchester, builder—February 13, R. Chatfield, Croydon, bricklayer—January 20, H. F. Simmonds, Prospect place, Cambridge-heath, builder—January 22, J. Huntley, Acton, builder—January 24, J. Dunbar, Lower Norwood, engineer—January 24, H. Alvey, Teddington, builder—January 29, G. Cockrell, Melbourn-terrace, Notting-hill, carpenter—February 13, J. Hart, Exmouth, contractor—January 15, J. Farrar, St. Helen's, builder.

PARTNERSHIPS DISSOLVED.

Bury and Pollard, New Park-street, Southwark, engineers—Thompson and Co., Northowram, stone merchants—Simms and Marten, Lawrence Pountney-lane, builders—Crosly and Robertson, Liverpool, decorators—J. and J. Langton, Bush-lane, timber merchants.

DIVIDENDS.

January 22, C. E. Bennett and T. E. Hignett, Liverpool, timber merchants.

DECLARATION OF DIVIDEND.

T. Freeman, Spa-road, Bermondsey, timber merchant, div. 2s. 7½d.

SCOTCH SEQUESTRATION.

George Rattray, Glasgow, painter, January 3, at 12.

THE BUILDING NEWS.

LONDON, FRIDAY, JANUARY 10, 1868.

THE LIFE AND WORKS OF SIR CHARLES BARRY.*

IT is hardly necessary to remark that the appearance of this work has nothing to do with the recent controversy as to who was the architect of the New Houses of Parliament. That some such impression as this may prevail among a certain portion of the public is just possible; but it was very generally known that a life of the late Sir Charles Barry had been in preparation for some length of time, and its appearance was looked forward to with a considerable degree of interest by the members of the profession to which he belonged, and of which he was so distinguished an ornament. "The inevitable difficulties in the task of preparation," to quote the words of the preface, "the duty of wading through long official documents, and the necessity of seeking in many quarters information, have delayed the publication of the memoir to a period far later than that originally contemplated." That the Pugin-Barry controversy may have somewhat hastened its publication is very likely, but the discussion of the question itself forms no part of the work. Dr. Barry, we observe, has, this very week, published a separate answer to the claims advanced by Mr. E. W. Pugin, in favour of his father, in connection with the Houses of Parliament, and that answer we shall notice on another occasion. The only allusion to this subject contained in the life before us occurs in the shape of an addendum to the preface. It runs thus:—

> Since this work was printed the risk alluded to in page 195, as likely to arise from the employment of the late Mr. A. W. Pugin, on the New Palace at Westminster, has been unexpectedly realized, fifteen years after his death, by some extraordinary claims put forward by his son. These claims, referring as they do to a question raised and settled in the lifetime of those concerned, have not appeared to me to require any notice in these pages. I have, therefore, left the passage in pp. 194-198 precisely as it was originally written, without the alteration of a single word. It contains the exact account of the connection which existed between Mr. A. W. Pugin and my father, and which, I repeat, so far as Sir Charles Barry's knowledge and feeling were concerned, was never broken by any dispute or estrangement, from the day when Mr. Pugin (then a young man of twenty-three) was first employed on the drawings of the New Palace, until the day of his death, in 1852.

Apart from his professional labours, the career of Sir Charles Barry presents few incidents of interest. His was a working life, but it was not an eventful one. He was the fourth son of a respectable stationer, and was born in Bridge-street, Westminster, on May 23, 1795, "in a house which (until last year) lay under the shadow of the clock-tower of the New Palace at Westminster." Notwithstanding that his father was a man of some wealth, Charles Barry appears to have had little advantage of education, or perhaps he took little advantage of the opportunities presented to him, for we are told that he was not very studious, full of fun, and by no means averse to mischief. When he left school at the age of fifteen, he had attained, however, to a superficial knowledge of English, a good proficiency in arithmetic, and a remarkably beautiful handwriting. Possessing strong artistic tastes, he was articled to Messrs. Middleton and Bailey, architects and surveyors, of Paradise-row, Lambeth. There he remained for six years, attaining his majority in 1816. Young Barry was a regular exhibitor at the Royal Academy, in the department of architecture, during the greater portion of his apprenticeship, but it does not appear that he distinguished himself in any way. Like all young architects of spirit and ambition, Barry now longed for the advantages of foreign travel, and accordingly, shortly after his articles were completed, he set out on a great educational tour. He left England in June, 1817, and remained abroad for more than three years. He travelled through France and Italy, visited various parts of Greece and Turkey (in company with Mr., afterwards Sir C. Eastlake), made an interesting tour in Egypt, Palestine, and Syria, and returned home through Italy and France, in August, 1820. The Eastern tour, it would appear, did not form a part of Mr. Barry's original programme. He had got as far as Constantinople, and was preparing to turn homewards, when an offer was made to him which he glady accepted. A gentleman, on his way to the East, struck by the beauty of Mr. Barry's sketches, offered to take him at a salary of £200 a year, and to pay all his expenses, in consideration of retaining all the original sketches he might make, the artist being allowed to make copies for himself. This was the third period of his travels, and he was wont to regard it as more important to him than all that had gone before. For one thing, he was probably the first English architect who had explored this wonderful country, and the remains of its architecture, we are told, made a far deeper impression on his mind than all Italy and Greece combined. He travelled with Mr. Ballie for nearly a year, and during that time executed about 500 drawings for him. Mr. Barry kept a journal in which he recorded the impressions which the grand old temples, palaces, and tombs, produced upon him. Many of these are minutely examined and described, as regards their dimensions and details. His critical notes, without being very strikingly expressed, show the strength of his artistic taste, and the acuteness of his observation. His remarks on the two great buildings of St. Peter's at Rome, and the Pantheon, might be quoted as specimens of his critical judgment. They reveal some of the leading principles of his composition. Says his biographer, St. Peter's disappointed him greatly in its elevation. He thought it had "a confused appearance, and want of simple grandeur," that "the openings in the centre were too crowded," and that "the three-quarter columns, always objectionable, did not afford sufficient relief." The details he greatly disliked. He noticed especially the want of apparent size in a building, one of the largest in the world, and accounted for it by the presence of colossal figures on the top of the façade, without anything to give the true scale,* by the want of sufficient projection in the front, and the enormous size of the windows, and by the possibility of seeing any great part of the dome from the piazza, whence alone the whole substructure was visible. On the whole, he much preferred the exterior of St. Paul's, in spite of the "piling of order upon order," which was a departure from Wild's original design; he preferred its regularity of design to the complicated front and lofty attic of St. Peter's. He thought the circular peristyle of columns under the dome far finer than the corresponding substructure in the other case; and, if only the churchyard could be enlarged, he thought that its complete insulation, and the fine perspective view which it offers, gave it a decided advantage in position and apparent grandeur.

It was far otherwise with the general effect of the interior of St. Peter's. Its magnificent size, satisfying his love of spaciousness, its beautiful proportions, and simplicity of design, its richness and completeness of decoration, producing a sense of harmony and perfection, seized his imagination at once, and seemed to "leave nothing to be desired." Its details he thought unworthy of special notice, but not so its decoration. The decoration of the dome delighted him; but the gem in his eyes was the baptistry. There the arrangements of marbles and mosaics seemed perfect, both in colour and form; it constantly recurred to him in designing, and had much to do with fixing his taste for that gorgeous kind of decoration. He delighted also in the gilding of the vault. Being wholly gilt (either dead or burnished gold), it seemed not gilt, but golden. This was to him real magnificence; "parcel gilding" was gaudy, and he held it in contempt. This vault and the ceiling of Sta. Maria Maggiore were models which he would have gladly followed in his designs, and it was with reluctance that he gave up the idea of making the roof of his House of Lords all gold.

The portico of the Pantheon he thought perfect in plan, and magnificent in effect. He admired its great depth, the increase of this in the centre, and, above all, the disposition of the inner columns, which gave apparent stability and variety of effect, without confusing the eye or obstructing the approach. He never could endure a portico which was shallow, or which had no inner columns, or which hid the wall; the background of the columns broken up by windows. But the junction to the circular building appeared to him unhappy. In fact, he objected *in toto* to the treatment of a portico as a mere porch, thinking that in all cases the portico should be a continuation of the main building.* The interior he used to quote as the finest example in the world of the grandeur of a dome, when sufficently near the eye to be comprehended in one glance. Domes like that of St. Peter's, which could only be seen by a painful throwing back of the neck, seemed to him wrong in principle. For at all times he held, that interiors should be so contrived that a spectator on entering should see enough of the design to enable him to comprehend the whole, and that, when this was not the case, there was a distraction of thought, fatal to any striking effect.

Immediately on his return to England, in August, 1820, Mr. Charles Barry commenced the practice of his profession, in Ely-place, Holborn. He experienced the usual lot of young architects generally, particularly in the matter of public competition. Of struggles, failures, and disappointments, he had his share. At one time he seems to have taken his want of success so greatly to heart that he entertained serious thoughts of quitting England, and trying his fortune in the more open field of America. We cannot but look upon it as fortunate for English architecture that he did not carry his resolve into effect. By-and-bye brighter prospects began to dawn upon him. He received much encouragement from his old masters, Messrs. Middleton and Bailey; and the Marquis of Lansdowne, whose acquaintance he had made at Rome, became a warm patron and friend. Through this nobleman he was introduced to Lord and Lady Holland, and was a frequent visitor at Holland House—these visits led in time to substantial results of work. Mr. Barry's first works of any importance were Prestwich and Campfield (Manchester) churches, the foundation stones of which were laid within a few days of each other in the month of August, 1822. They were Gothic in style, but neither design was very successful; indeed, we are told that these first essays of the future architect of the Houses of Parliament served as a continual subject of laughter to his friend Mr. Pugin, and to himself in after years. In connection with the Prestwich Church, we have the following anecdote:—

> Soon after the opening of his church at Prestwich there came an express from Manchester, stating that one of the galleries had shown signs of falling during service, that the congregation had

* "The Life and Works of Sir Charles Barry, R.A., F.R.S., &c." By Rev. ALFRED BARRY, D.D., Principal of Cheltenham College. John Murray. 1867.

* He adds "the Egyptians, who made much use of colossal figures, being fully aware of their tendency to diminish the apparent size of the building, always placed at their feet other figures of the natural size, to give the true scale."

* In his only design for a grand portico, that of the Town Hall of Birmingham, this principle was fully carried out. This design, however, was not successful in competition.

rushed out in panic, and that many were seriously hurt. By the time the then tedious journey to Manchester was over, the report had grown into "Stand Church fallen, 300 killed and wounded." It turned out that a small hair crack had appeared in the plaster in consequence of too rapid drying. A man under the gallery perceived it, and fancied that it widened rapidly, whereupon he shouted out, "The church is falling!" The consequence of this sapient proceeding was a sudden rush to the doors, at one of which the steps had not yet been fixed. Down went the temporary steps, and the congregation over them. Happily but few were hurt, and those not seriously; so the architect's reputation escaped.

In the following year he erected a church at Oldham, similar in scale and style, and also competed for the new buildings at King's College, Cambridge, the design to be either Grecian or Gothic. Mr. Barry chose the former, but his design was not successful. Next year he built the Royal Institution of Fine Arts, at Manchester, a building of considerable size and importance, in the Græco-Roman style. Here he showed a marked advance, and the originality of his work was apparent. St. Peter's Church, Brighton, belongs to the same year. It was his first important Gothic design, and was the result of a severe competition. This church was thought highly of at the time, and secured to Mr. Barry a good position in the ranks of church architects. He was very proud of this victory, and felt that he had entered on a brilliant career. During the next half dozen years his pencil was actively employed. He built Brunswick Chapel at Brighton; rebuilt Petworth Church (1827) for Lord Egremont; and erected churches at Holloway, Bulls' Pond, and Cloudesley-square, Islington, all in one year. He also designed the Sussex County Hospital (1826), and a chapel and schools at Saffron-hill, and a villa, in the Italian style, for Mr. Attree, at Queen's-park, Brighton. About the same period he sent in designs for the Leeds Exchange, for a church at Kensington, another at Streatham, for a new concert-room at Manchester, and for the Law Institution. For the Pitt Press competition at Cambridge (1828) he prepared no fewer than four different designs. He was thus busily engaged, and rapidly making a name in his profession, when, in 1829, he entered into a select competition for the erection of the Travellers' Club in Pall-mall. The result is well known. This building not only holds a high place among his works, but it is universally admitted that it offers a model for imitation in the Italian style. We may here record our unqualified disapproval of the removal of the balustrade from the Carlton-gardens front of the club, and putting in its place a common iron railing, without rhyme or reason. The Travellers' Club was completed in 1831. "Since that time the great competition for the New Palace at Westminster had been decided, and his success had secured him a place in the first rank of British architects." The drawings for the Palace were sent in on the 1st December, 1835, the competitors numbering ninety-seven. On the 26th of February, in the following year, the award was published. In 1837 Mr. Charles Barry was invited to enter a select competition for the erection of the Reform Club. The other competitors were Messrs. Basevi, Blore, Burton, Cockerell, and Smirke, and Mr. Barry's design was chosen. Those critics who declared the Travellers' Club to be a mere copy of the Villa Pandolfini were now equally busy in instituting a comparison between the Farnese Palace and the Reform Club, preferring a charge of plagiarism against its architect. Such is the usual penalty that success has to pay. The Reform Club is the Travellers' Club on a more complete and grander scale. It has been described by Mr. Digby Wyatt as an example that "the most minute attention to comfort, and the satisfactory working of utilitarian necessities, are compatible with the exercise of the most delicate sense of refinement and the hardihood of genius." The other works of Mr. Barry in the same style were the Manchester Athenæum, Bridgewater House (built for the Earl of Ellesmere in 1847)—the last of his great Italian buildings in London, and Halifax Town Hall, the last Italian building which he designed. In these buildings, particularly the last, may be traced the change which Mr. Barry's architectural taste had gradually undergone, and which was in no small measure influenced by the Gothic work at the New Palace. The change, as has been said, is chiefly traceable in a tendency to greater freedom of treatment, and to a desire for greater richness of effect. It should be noted, with regard to the Town Hall of Halifax, that the building, though designed by Sir Charles Barry, was actually carried out by his son, Mr. E. M. Barry, A.R.A. In the conversion and alteration of existing buildings, public and private, Mr. Barry enjoyed a great reputation. His skill in this respect was beyond dispute. The College of Surgeons, and particularly the Board of Trade at Whitehall, both of which he remodelled, may be instanced. A large number of private mansions also came under his transforming hand. In 1837 he reconstructed Walton House for the Earl of Tankerville; and almost at the same period, on a more extensive scale, Highclere House, Hampshire, for the Earl of Carnarvon. He considered this one of his happiest works, and called it Anglo-Italian. He effected great alterations at Trentham Hall, the residence of the Duke of Sutherland, and carried out a scheme of architectural gardens, which, considering the difficulties he had to contend with, are eminently successful. Duncombe Park, the seat of Lord Feversham, and Harewood House, were conversions on a smaller scale. But perhaps his most successful labours in this direction were at Shrubland Park, Suffolk, for Sir W. Middleton, and at Chiefden House, Berkshire. He produced very striking effects here, and no better examples of Sir C. Barry's skill in reconstruction could be pointed to. We shall return to the consideration of this volume next week.

THE BRITISH WORKMEN IN THE PARIS EXHIBITION.

THE British workman has played a rather important part in the history of the past year. For his benefit, and in obedience to his demands, which could be no longer resisted, a Reform Bill almost revolutionary in its character has been passed. In the estimation of many thoughtful men, the bill will not only alter the complexion and the composition of parties, but it will introduce social energies which in their action will materially increase the force and raise the character of England. At all events, whether for weal or for woe, the British workman is destined to play a much more important part in the affairs of the nation than he has done hitherto. He has been seen during the year in several aspects. He has been seen at multitudinous political gatherings, before commissions to enquire into the nature and workings of trades' unions, and at the Paris Exhibition. Let us look at him for a moment or two at the latter place. Early last year, efforts were made in several directions to smooth away the difficulties in the way of the British artizan visiting the Exhibition. A working man's excursion committee was formed under the presidency of Mr. Layard, M.P., which, though it fell short of its intentions, did some good. The cheap trips which were organized by Mr. Cook, who deserves all honour, assisted some 20,000 Englishmen to visit the Exhibition, and the Society of Arts, which is ever ready to promote "the arts, manufactures, and commerce," of the country, passed a minute early in the year, to the effect, that at former international exhibitions held in this country, arrangements were made by the French Government to facilitate the visits of skilled artizans, and interesting reports were made by them to their government, and believing that such visits on the part of skilled workmen, not only exercised a beneficial influence upon the men themselves, but also on the industry of the country to which they belong, the society resolved to raise a fund to be employed in aiding a limited number of workmen to proceed to Paris for the purpose of studying the Exhibition. This minute was carried into operation. Subscriptions were invited and received. The Government looked on with a favourable eye, and the Committee of Council on Education decided to place at the disposal of the Society of Arts £500, provided that the society raised at least the same amount by voluntary subscription. The sum subscribed amounted to upwards of £1,000, which enabled the society to assist upwards of eighty skilled artizans, representing the principal industries of the country, to visit the Exhibition. The endeavour was to select men whose intelligence and knowledge of their particular trades, and whose position among their fellow workmen, were such that their reports on their respective branches of industry would command attention. Several great employers of labour and chambers of commerce co-operated in the work, and foremost must be mentioned the Birmingham Chamber of Commerce. The visit of the workmen from Birmingham was organized by Mr. W. C. Aitken, who, to all appearances, performed his work admirably. Mr. Aitken's introductory report to the reports from Birmingham artizans is a valuable document. Mr. Coningsby's report on the habits of the French working classes is very suggestive. In fact, there is not a report which will not more than repay perusal. The following are the subjects reported on, and the names of the writers.

PART I.

REPORTS BY ARTIZANS FROM LONDON, SHEFFIELD, COVENTRY, BRADFORD, NEWCASTLE-UNDER-LYNE, &c.

Cabinet-making	Charles Alfred Hooper
Ceramic decoration	Aaron Green
Saws and tools	William Brunhall
Cutlery	John Wilson
Chair-making	Benjamin Lucraft

Die-sinking.....	Charles Wm. Moore
Electro-plate	Henry J. Fellows
Tin-plate working...	Edwin Poole
Labour saving machines	Henry Fowler
Railway carriage and waggon building.....	Benjamin Whitehouse
Design.....	Frank J. Jackson

The volume has been edited by Mr. Charles Critchett, the assistant secretary of the Society of Arts, who has carefully preserved the integrity of the reports. Only a few trifling corrections have been made. The preface to the volume, signed by W. Hawes, chairman, and P. Le Neve Foster, secretary, concludes with the following sentence: "It is hoped the reports will be found interesting, not only to the writers' fellow-workmen, but to all interested in the progress of industry; and, considering that they are writen by men, most of whom have never before attempted to write a report on any subject, and all of whom are actually engaged in industrial occupations, they are, in most cases, highly creditable to their authors, and will, no doubt, be received with the consideration they deserve." After reading several of the reports, we heartily endorse this opinion. Here, then, the British workman appears in rather a new phase; not as an agitator demanding political rights, nor as a trades' unionist proposing strikes, but as an intelligent British observer; and we have no donbt that his observations and reflections, as recorded in this volume, will produce real good. Frequently exhibitions are described and criticised, and articles are written on art and industry, by men who possess only literary qualifications, and the result is that their criticisms are merely pleasant reading. They do not possess the technical education which entitles them to speak with authority on many things on which they have written. In this instance, it is different. Skilled workmen have criticised in their own language skilled workmanship, and passed their opinion on men and things. The result is a valuable body of practical information, which could not be obtained in any other way. We regard it as the most cheaply purchased information ever published. In future numbers we hope to give some extracts from the reports most interesting to architects, builders, and art students, and so leave our readers to judge of the contents of the volume for themselves.

MARKS ON DEALS AND QUALITY OF TIMBER.*

HAVING explained the broad principle upon which Swedish goods are branded, we may note a few exceptional matters. Although we are familiar with mixed thirds and fourths goods, we have many shipments of mixed and thirds only, *i.e.*, best and common. This is especially the case with white goods from Norway and the southern parts of Sweden. Thus, P D H, mixed; D × H, thirds, from Hernosand; A. T. and Co., mixed; C × S, thirds, from Fredrickstadt; B S, mixed; B T, thirds, from Nordvig, near Christiana; H.R.H., mixed; M. H. M., thirds, from Christiana. We may note the following amongst the eccentric form of brands. From Stockenvicken we have the letters STOCKEN branded in blue paint upon the mixed goods, and the same brand in red paint upon the thirds quality. A shipment of goods from near Gefle comes to hand with A and a broad arrow on the mixed goods, T and a broad arrow upon the thirds goods, and an arrow only upon the fourths. We have M between two crowns for the mixed of a Marma shipment, T between two crowns for the thirds goods, and a M B for the fourths. This brand is noticeable as having crowns upon the thirds goods. A shipper from Hernosand brands his mixed goods BERGERE in large letters, and his thirds goods ELB; some of these brands are drawn from very simple sources, being a mere transposition of letters, and the introduction of the never-failing crown. Thus, on a Sundswall shipment, we have S A S } as the brands for the three qua-
S A } lities of goods. In this case we
S } have small rings or circles placed over the points of the letters A, to distinguish them from a similar brand shipped from the same port. The latter shipment would bear a brand with the letters inclining thus, *S A S*, *S A*, and *S*. We have another illustration of this simple arrangement in a Soderhamn shipment, F crown G } for the various qualities. As the
F G } timber merchants have such a
F } number of brands to deal with, it naturally follows that confusion ensues. To obviate this, the shippers adopt signs by which to distinguish their goods from other makers, as in the above instance of Sundswall goods. This is also the case with large makers who ship goods from various ports. We have a Soderhamn firm whose best goods are branded B S S C. Other goods are in the market branded B S 1st S C (pronounced "B S firsts S C"), these are by the same makers, but are shipped from Bjorneborg, instead of Soderhamn. Enough has been said to give an outline of the principles adopted in branding Russian and Swedish goods, and, as this matter bears so closely upon "the qualities of timber," we shall refer to it again, when treating upon Baltic goods under the latter heading.

Goods from Canada, as a rule, are not branded; the qualities are distinguished by red marks upon the sides, thus (I) (II) (III). With Quebec goods we rarely see brands used. A single M or two letters in black paint may denote exceptionable shipments from makers very far up the country. Saguenay goods are often marked, but there seems no settled custom or colour of the brands. "Dobell's" shipments may come to hand branded R R D in black, red, or white paint. These white brands are scarcely distinguishable when the deals are new, but, as they become old and black at the ends, the letters are very conspicuous. Another maker will brand his best goods with a crown in black paint, and his seconds goods with a crown from the blow of a hammer, or, to use the trade term, "with a dry stamp," the thirds goods being unbranded. Gilmore, Rankin, and Co., the great merchant shippers, will brand their goods with dry stamps, G R I for best goods and G R 2 for seconds goods. The low ports, as they are called, very often ship branded goods. These ports include Richibucto, Meramichi, Shediac, &c., whose shipments are inferior in quality to those of Quebec. From these remarks it will be seen that brands upon timber is a great and important subject. It is one in the hands of a small community of our traders, and is, consequently, a class of knowledge over which they are strict conservators. It is a subject new to authors, and that portion of our tradesmen whose office it is to buy and consume timber. This is somewhat strange, as the meaning of brands are well known on other goods that people engaged in trade are called upon to purchase. With architects, clerks of works, and builders generally, brands upon timbers are looked upon with perfect indifference. The current remarks are "I can tell a bit of good wood when I see it," &c., and, as builders generally pursue the old-fashioned system of buying from inspection, the question carries but little importance. Why this state of things should exist is not easy to explain. Architects will specify a particular stone or brick, and even the name of the quarry owner or the maker. Such is the case in ironwork, slating, and every other department of the building trade; but with timber it is left an open question, or if goods from a particular port are mentioned there is rarely any supervision exercised over the qualities. The modern system of competition tends to the use of common materials, and in no branch of the building trade is this so patent as in timber. Goods of the best brands were common a few years ago in almost every timber yard of the country, and in the principal ports they were important features of trade. Competition has brought on a craving for common or inferior goods, and nearly the whole of the trade is now carried on in this branch. First-brands are rarely found in timber yards, and even with the largest importers one or two cargoes will see them through a season. London alone has kept up its standard in this respect. Whether they are consumed in the building trade is another matter; but one thing is certain, the great outcry of "deterioration of timber," rests more with the architects and the builders than it does with nature or the foreign makers. Wood goods are to be bought as good in quality to-day as they were fifty years ago, as far as the best brands of Petersburg and Archangel deals are concerned. Coach-builders, pianoforte makers, and numerous other trades, which are centred in London and Paris, consume the bulk of the best quality goods now manufactured. The explanation given by builders is "because they can afford to pay for them."

Were brands upon timber better known, architects would get better work and builders would obtain greater credit. The cheap builder would find his place, and what are termed "old-fashioned builders" would again occupy the position they so richly merit. Fifty years ago, when competition was in its infancy, estimates were only solicited from builders who kept large stocks of good dry timber, but now everything is reversed. Tenders are advertised for in the public papers, and the lowest (be he whom he may) is nine times out of ten accepted as the contractor. So long as this system exists so long will the demand for common goods increase to the exclusion of the better shipments. It is not saying too much to assert that builders have almost given up purchasing the old-fashioned best quality of timbers, and have allowed them to pass into other branches of trade where competition is not so fierce. As we have no published information upon the subject of marks on timber, it is not altogether a matter of regret. A work of this kind would bear comparison with "Builders' Price Books," a fresh edition being required every year. This would not be owing to fluctuations in the cost of labour, but to the fact that timber brands are constantly changing. New firms are shipping goods with strange brands, and old firms are

* Continued from page 399.

changing their devices or retiring from the trade; added to this we have whole shipments of goods marked with the English merchants' or importers' names, this being done to order and forming part of the contracts. A well-known firm in this country are now importing Gottenburg goods with the thirds quality branded R. W. S. This "branding to order" is becoming very common, and, as the ordinary business of importing timber requires a great deal of time, this may be readily done. Goods for the coming season will be purchased in January or February, or as soon as the makers can inform their brokers what goods they can produce for the season. As they cannot be shipped until March, April, or May, when the ice is broken up in the northern seas and rivers, ample time is afforded for the importers to obtain their goods "branded to order."

TIMBER FORESTS.

"Trees," those lords of the vegetable kingdom, are naturally produced throughout the whole of the temperate regions. Wherever sufficient soil and humidity exists vegetation will spontaneously follow. Indeed, in this respect, we cannot draw a severe line, for trees of important size are alike found in the arid swamps of Havannah, and far out in the Arctic regions. Generally speaking, trees of tropical climates are hard wooded, whereas those of the northern regions are soft. With us, in England, we have a happy medium, ranging from the hardness of the forest oaks, beech, or ash, to the softness of the pines, poplars, and the willows. Trees of temperate climates shed their leaves in winter, this is partially the case in tropical climates. The Ilex oak of Spain is an evergreen, as is also our English oak when grown in tropical climates. The forest trees of northern districts are mostly evergreens. Those of Russia and Sweden, which are principally the "pinus Sylvestris," the wood or Scotch fir, and the "abies Excelsa," the Norway spruce or white wood of commerce, retain their leaves in winter. This is a wise ordinance of Nature, as they thus form a shelter for animal and the lower orders of vegetable life during the long dreary winter seasons. The pines of Russia, Scandinavia, and Canada are truly indigenous. Where light and humidity exists they will spring up from a mere handful of soil. Whole forests in Sweden are growing upon hard granite rocks, with a covering of two feet of peaty soil derived from vegetable decomposition. Such is the hardness of the rocks that the trees cannot strike in their roots; they consequently spread out upon the surface and stand upon their own bottom, being upheld and guarded from the passing winds by their brethren. In tempestuous nights whole districts will be blown down, making broad tracks through the forests. In this case, and wherever timber has been felled by the woodman, the same class of trees will spontaneously spring up in countless numbers. The ground is literally covered with seeds season by season, where they perish for want of light. Trees so ushered into life will struggle manfully for existence, the stoutest overlopping the weakest, whose branches will languish in the shade. Thus are new forests created, their vast numbers preventing them from throwing out lateral branches. Such is the rapidity of their growth that they are straight and symmetrical without a branch for 50ft. or 60ft.—instance the young trees shipped from Christiana as scaffold poles for builders. This rapidity of growth in height causes the lateral branches to die before they have obtained any size; the ceaseless action of the surrounding trees speedily breaks off the dead branches, and in a few years they are covered over with clear new wood, only to again show themselves as dead knots in the centre of the wood when in the hands of our carpenters. Trees of all kinds will thus bury the records of their younger branches. This is noticeable in the Russian red timber brought to this country as lathwood. These trees, from 9in. to 12in. in diameter, are cut into lengths of 6ft. or 8ft., and split into segments. The heart wood is afterwards riven off and left in the forests as firewood, because it contains the dead knots or roots of the younger branches, and is thus too coarse to be riven into laths. It may perhaps appear strange to assert that the Baltic red wood laths used by our plasterers are nearly wholly riven from sap wood, the proportion of heart wood, owing to the above cause, being remarkably small. In this respect the laths of the present day contrast unfavourably with those of the last century, which were riven from true heart of English oak. Respecting the capabilities of Russia for producing timbers and keeping pace with the enormous demand, we may note that that empire is eighteen times as large as the British Isles, and nearly one-half of its area is covered with natural forests. Timber is not, like coal, subject to exhaustion, for its like will speedily be reproduced. In Southern Russia, the great granary of Europe, fir trees will attain a diameter of 2ft. in fifty years. Other situations not so favourable will produce 15in. trees in the same period. This may be taken as a rule for Stockholm timber, and the central districts of Sweden. Northwards, as we approach the White Sea, the average of growth is only half the above rate. Closeness of grain is a characteristic of Archangel, Onega, and the best shipments of Petersburg goods. As they are not so robust in size as the Memel and Dantzic timbers, they put out fewer branches, which are considerably smaller in size; the result is a clearer description of timber, though inferior in size. This statement of the comparative growth of trees will apply to white wood as well as red, although in the most favoured districts for rapid development it will not make such progress. It has been said that the fir and the spruce will not grow together. This is not the case, as they are frequently found intermixed, and growing so close together that a man cannot walk between them. It is true that districts are found where one class of tree wholly prevails. This may be explained by the constant struggle for existence which is exhibited throughout the whole of Nature. When once a particular tree-plant or animal obtains an undue preponderance or balance of power it is only a work of time for the weakest to become exterminated. It is thus that the fact of whole districts producing one particular class of timber can be explained. Scandinavia (Sweden and Norway) is of minor extent to its overgrown neighbour Russia, but throughout its area it contains a larger proportion of forest land, which composes four-fifths of its total acreage.

Since Baltic timber first became an article of export, rivers and lakes have been the main agents in transporting it to the shipping ports. Distance is a matter of very little moment, as the logs are cast upon the waters to be found after many days. The trees are felled throughout the autumn and winter months, and are sledged to the banks of the rivers, where they are marked and piled for transport. The snow of the preceding winter thaws in the spring, and the silent rivers are again in motion. As they rise with the swollen flood, the piles of timber stored on the banks are swept off through mountain ravines, over tall precipices, where they are lost in the seething foam, to be again found floating on the silent lakes in the neighbourhood of the shipping stations. Such are the numbers of trees and logs carried into these lakes in the summer months, that navigation is pursued with the greatest difficulty, and it is a common occurrence for steamers to be delayed for hours in their attempt to find a passage through these floating forests. To collect these trees and hand them over to their owners is a work of considerable importance. As may be supposed, numbers of trees are lost or entangled on the river-banks in their downward course; this is a matter of very little moment, as there is only the cost of felling and sledging to bring to their charge. The first cost of the trees themselves may be estimated at sixpence each—primeval trees of the finest timber that the country produces may be purchased in Sweden at sixpence each—and at this low rate the income derived from the sale of timber is sufficient to place the owners of the forests in the list of Swedish aristocracy, and make them the friends of kings. The cultivated lands of Sweden and Norway are mostly on the banks of the rivers, and represent districts cleared of timber. These cleared districts are extensive, and where the soil is of sufficient depth for cultivation the young trees are prevented from taking root, and it is added to the arable or cultivated land of the farms. This being the case, it naturally follows that timber has to be yearly sledged from greater distances to the banks of the rivers, or new forests must be broken into. Of late years, as railways have developed, new districts of primeval forest lands have been opened, and, as their working expenses are light compared with those of this country, timber is carried to the seaports at a low rate, and in superior condition. This will explain the great improvement of late years in some shipments of Swedish goods. The laws of Sweden are favourable to its development; labour, land, and produce are remarkably cheap; farms and estates are constantly in the English market for sale, and, as an example of their cost, we may note that a farm of three hundred acres, part cultivated and part forest, with the buildings and stock, may be purchased for £300. A saw-mill may be thrown into the bargain. These are not costly erections, being mostly of wood and propelled by water-power. The rate of labour is from eightpence to tenpence per day of eleven hours; added to this, the female servants attached to these farms or saw-mills do a great portion of the work solely in the hands of men in this country—instance the care and management of horses and stable routine.

This floating of timber may be specially applied to Canadian goods, but with this difference, the timber is rafted in a converted form, and receives considerable damage by immersion. Timber in Canada is wholly in the hands of British colonists, and the felling, hewing, sledging, and rafting down the rivers, is a work of great hardship and privation. The timbers of commerce that we shall principally notice is the pine (pinus Strobus) or Weymouth pine, and the spruce (abies Nigra) or black spruce. The best class of pine is that shipped from Quebec, and the best class of spruce is exported from St. John's. Rafted or floated deals are shipped from all the Canadian ports except St. John's, and it is the fact of St. John's spruce being bright or unwatered that creates a special value. With the other ports bright and floated deals are shipped together, but the difference in cost in no case is so great as with goods from Quebec. With last season's goods, the shippers were selling their bright deals at 25s., 20s., and 10s. per standard for the first, second, and third qualities, more than those of floated quality. Floated deals when dry, are somewhat dearer; in this case they are called "dry floated," being piled and dried at the ports before shipping. This floating of pine timber permanently damages the goods, owing to the absorbent nature of the wood. The effects are twofold; firstly, they are discoloured, especially on the sap; and, secondly, they are apt to dry ring and shell shaped—these two evils preclude their use for superior work. Bright deals, if shipped in good condition, will come to hand as clean as when first sawn, but floated deals, if afterwards dried, are discoloured and gritty upon the surface, and cannot be sold as new season's shipments.*

One of the oldest relics of Chaldean art has been recently acquired by the British Museum. This is the signet cylinder of Ilgi, who reigned over Lower Chaldea about 2050 B.C.

* To be continued.

EXCURSIONISTS TO THE PARIS EXHIBITION.

ON Monday evening last a soirée was held in the Cavendish Rooms, Mortimer-street, in honour of Mr. Hodgson Pratt, who worked so hard in promoting the visit of English workmen to the Paris Exhibition last year. Mr. Cole, in the absence of Mr. Layard, presided. From the report which was read, and the speeches which were made at the meeting, Mr. Pratt laboured indefatigably in forwarding the good work; and we are sorry that he should have been out of pocket, and that the preparations made were not more extensively appreciated and responded to. Whilst everybody at the small meeting thanked Mr. Pratt, and whilst almost everybody was thanking everybody else, we were surprised that no word of praise was given to Mr. Thomas Cook, who did more than anyone else, or all put together, to facilitate the visit of British workmen to the Exhibition. Of course he laboured from an interested motive, and we sincerely trust that he has been well rewarded for his industry, courage, and enterprize. We hear that nearly 20,000 Englishmen went to Paris through Mr. Cook's agency. It is very easy to be wise after the event; but we could not help thinking, while at the meeting on Monday evening, that it was a great pity that Mr. Pratt's committee had not solicited the co-operation of Mr. Cook, as no doubt, if he had done so, much needless labour and anxiety might have been spared, and much money saved. In this age of testimonials who will testimonialize Mr. Cook? At all events he deserved the thanks of the British public.

THE CATHEDRAL OF BURGOS.

A RECENT American tourist in Spain gives some interesting particulars regarding the Cathedral of Burgos, which may be of interest to our readers. Burgos is a dull decayed old city of less than twenty thousand inhabitants. The ancient cathedral, erected by King St. Ferdinand in the thirteenth century, is one of the most sublime Gothic structures to be found in Europe, and strikes the mind of every beholder with wonder and astonishment. The exterior effect of the building, we are informed, is much injured by its unfavourable situation, and the mean buildings which have been erected close to its side walls. Nevertheless the principal front is exceedingly fine, and the spires and pinnacles rise most beautifully in richly carved open work, so that on a clear night the stars may be seen glittering through them. The interior is in the form of a Latin cross, 300 feet long, 213 feet wide, and 193 feet high. Independent of the magnificent central nave, with its elaborate ornamentation and fine retalbo, or high altar, there are two lateral naves and fifteen distinct chapels, some of which are as large as an ordinary church; besides these there are also extensive cloisters, and other church appurtenances, the whole containing fine tombs, sculptures, and paintings of ancient date. There are a number of very curious relics in the cathedral, which are held in high veneration by the inhabitants of Burgos. For instance, they have the Christo de Burgos, a wooden image of Christ which was, according to their traditions, carved by Nicodemus, a ruler of the Jews, shortly after he and Joseph of Arimathea had buried our Lord. It was rescued from a box found floating in the sea. There is also an image of St. Cecilia, a recumbent figure, to which is ascribed the special virtue of curing aches and pains about the head. The devotees of this saint bring their tresses to the shrine under the belief that by so doing they will be cured of the headache. There is also to be seen the famous old trunk of Mio Cid, the legendary hero and poet of Spain, who, being short of money to prosecute his campaign against Valencia, resorted to the sharp financial dodge of filling the box with sand, and pledging it for so much, to the Jews for a liberal loan of hard cash. The bones of the Cid, and of his faithful heroic wife Iimena, are carefully preserved in a walnut case. The dust is corked up in a beer-bottle, and is shown to strangers in a room fitted up as a chapel in the old townhall. In this same building is also preserved the first throne of the kings of Castile, a very common old wooden arm-chair.

TOMBS IN OLD ABERDEEN CATHEDRAL.

A SHORT time since we received the following letter, with sketches of tombs as represented in one of our lithograph pages this week:—

SIR,—It has often occurred to me that it would be advantageous to the readers of your paper if a few drawings of monumental structures, such as tombs, memorials, &c. (mediæval), were introduced amongst the various illustrations. These structures were the gems of architecture. On them were lavished all the treasures of art, and the richest decorations of the age were freely bestowed on them. No pains were spared to render them beautiful, and the fact of their being the richest and best specimens of mediæval architecture, renders them particularly worthy of close investigation and the most diligent research. I would beg to suggest to those of your readers who can with convenience make drawings of these monuments, to do so. The time spent in a close investigation will be well rewarded by the knowledge of Gothic detail which will thus accrue to the sketcher, whilst the course of training he will have thus undergone will also be valuable.—C.

The largest engraving represents Bishop Dunbar's tomb, with a vault below, built and paved with hewn stone, with large stone covering. The tomb has been much defaced, the inscription obliterated, and the marble statue formerly lying there completely gone. The broken effigy at present there is supposed to be that of a nun, the head of which was found in said vault. Gavin Dunbar was bishop of Aberdeen from 1518 to 1532, and the tomb is supposed to have been erected during this period. The existing cornice is supposed to have been no part of the original design.

Near to this tomb is another, and the only description obtainable is in "Orem's" book, written about 1724. It says:—"In the same transept (south), under another round arch of oak branches, is another altar tomb with a bishop, *in pontificalibus*, headless, a lion at his feet, and under his head a pointed helmet for a cushion, &c." This figure is no longer there, but the space under the arch has been filled in with an inscription on polished granite to the memory of some of the late academical magnates. The tomb is in a very dilapidated state.

YORK IN MDCCCLXVII.

YORK has not been stationary in the way of architectural improvements. In the Guildhall two more of the series of historical stained-glass windows have been inserted; other two are, we believe, ready for fixing; and the designs for several more will shortly be completed by Mr. Doyle, the author of the "Chronicles of England," to whose able hands the arrangement of the various subjects has been consigned. The time we trust is not far distant when this fine old Gothic fabric will have all its windows filled with stained glass, descriptive of memorable events connected with the history of York from the Roman invasion to the present reign.

Our Cathedral continues to receive the diligent attention of the Dean and Chapter, and the year 1867 has seen various restorations of the fabric and improvements in the internal arrangements happily completed.

As to prospective improvements in our ancient city, the Yorkshire Club having completed the purchase of the house now occupied by the Rev. T. Richardson, in Lendal, and the adjacent land extending to the river front, this extensive and admirable site is to be devoted to the erection of a magnificent Club-House. We believe that, for extent and elegance, the new building will not be excelled, if equalled, by any similar erection in the provinces.

The building of the new Railway Station in this city has been deferred, probably to an indefinite period; and we would again offer the suggestion that for the excursion traffic a line of rails should be laid and a neat shed erected outside the walls, with an entrance into the city fronting Rougier-street. This would be a great improvement to the present practice of leaving excursionists at Holgate—a mile from the principal objects of attraction in the city

York has long been noted as a city of steeples, and within the last twenty-five years much has been done for the restoration of our many fine old churches. The year 1867 has contributed its share in the good work. The west front of St. Michael-le-Belfrey has been rebuilt; and the hideous side galleries in St. Saviour's church have been removed, and other internal improvements have been effected in that edifice. Some minor works have also been accomplished in other of our churches. The city has continued to stretch itself out into the suburbs, which are becoming more populous, and consequently increased church accommodation has been called for and provided at Dringhouses, and more recently at Clifton and Fulford. Another church is now in course of erection at Heworth.

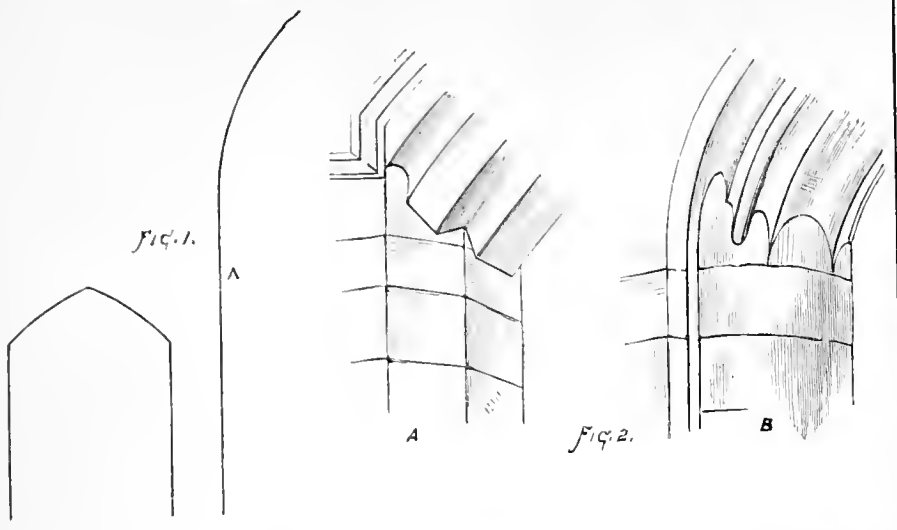
Something has also been done and is doing in providing parsonages for the clergy. St. Cuthbert has its new rectory-house; St. Mary Bishophill Junior has also had a capacious parsonage erected; its neighbour, St. Mary Bishophill Senior, is about to be provided with one; and the new district parish of St. Thomas has a substantial parsonage nearly completed. Four of our poorest livings have likewise been augmented; and altogether we hope that we are progressing as churchmen in material advantages. We hear of other contemplated works in reference to the Church in this city. There is one point on which we would venture a suggestion. It is that the Ecclesiastical Commissioners, in building new parsonages, should have some regard to the incomes of the benefices, and remember that houses unnecessarily large are a burthen rather than a benefit to the incumbents; further, we would say that it is well that the parsonages should be so placed that the incumbents should be with or as near as possible to the bulk of their people.

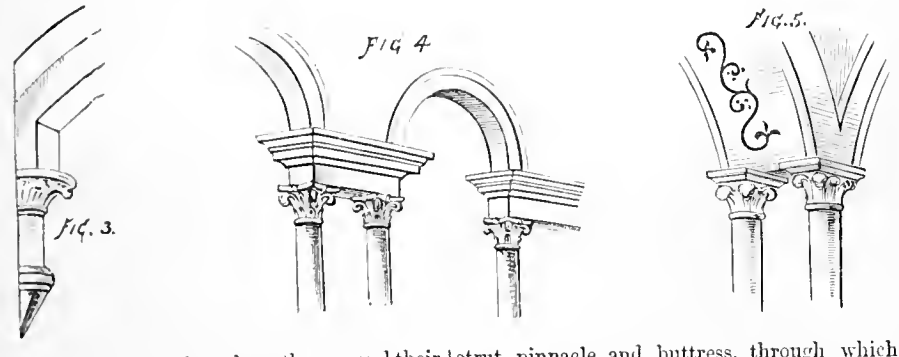
Among the members of the other religious communities there has been no lack of activity. The Baptists are building a very handsome church in Priory-street, and the Wesleyans have in course of construction a new school-chapel in the Groves district. The Independents (under the pastorate of the Rev. James Parsons) are building an organ gallery in their chapel, and are having a new organ constructed of great power and compass. These are all evidences that, with our increased prosperity in worldly affairs, our citizens are not indifferent to the advancement of the cause of religion.—*Yorkshire Gazette.*

CONSTRUCTIVE AND ÆSTHETIC DESIGN.—No. X.

BEFORE leaving the constructive arch and vault, and their place in the mechanical structure, let us refer to their æsthetic value. It is interesting to trace the Roman development of the arch, the temerity displayed in dealing with it as a decorative feature; how it was first concealed, like we did a generation back, behind plaster; how it afterwards struggled into a visible, though subordinate, expression—at first becoming subservient to the horizontal lines, and gradually breaking through them in its full-growth, as in the Pantheon—till it reached, in the Basilican and Romanesque styles, its fullest power. The change from the continuous to the interrupted entablature effected a revolution in architectural design, and was a step towards that uninterrupted verticality of treatment which obtained such significant and beautiful prominence in the Pointed styles. Bit by bit the entablature was broken through, first by intercolumnar recessions, then these gave way to discontinuous imposts, till, at last, the arch sprang directly from the capitals, as noticed in the arcaded court of Diocletian's Palace of Spalatro. Horizontality thence became a secondary, rather than a primary, principle; all intermediate cornices and string-courses stopping against the vertical masses, instead of interrupting them. The architects of the Revival showed their pedantry, rather than taste, when they left disjointed bits of entablature over their columns, as seen in many of our metropolitan churches, the effect being more comic and "acrobatic" than judicious, but when the plan is resorted to now it becomes an unpardonable affectation. This leads me to notice the necessity of stilting our arches a little, so that their springing should be a trifle higher than the line of capitals, an obvious way of correcting the apparently abrupt springing otherwise resulting from the abacus cutting off an appreciable portion of the arch, besides the foreshortening of all

CONSTRUCTIVE AND ÆSTHETIC DESIGN.





vertical distances when above the eye, and their consequent visible depression. The degree of this correction (as, indeed, of all others) ought to be regulated by the distance from which the majority of spectators see the arch, but chiefly from the position the eye longest rests upon it, and generally the stilting should be rather overdone than deficiently. This remark applies with even greater force to elliptical arches, while to segmental ones, of course, a visible stilt over the impost mouldings is essential, good architecture abhorring acute angles of this sort, as I shall show hereafter.

The discordance between the mechanical structure and the decorative features ceased when the arch took its legitimate place in the visible structure. Rectangular forms were greatly superseded by circular forms, and this circularity became also noticeable in the plans of temples and tombs from the rotunda of the Pantheon, generally ascribed to the Augustan age,* to the smallest tomb or baptistry. The circular plan of tomb was perhaps derived from the Pelasgian form, though the Romans retained it in conjunction with polygonal forms, which met the necessities of doming better; and the decagonal temple of Minerva Medica combined perhaps all the beauties—scientific and æsthetic—to be found in the arch system of construction. Mr. Fergusson rightly imagines the Middle Age builders knew little besides the ideas involved in this building, and I think few better models of æsthetic design can be picked out. It combines economy of material with lightness and rigidity of structure, while an artistic effect is attained—qualities of building which it is the object of these papers to clearly lay down, in contradistinction to fashionable crudities and ridiculous excesses.

It was left to the Gothic builder, however, to perfectly reconcile the mechanical with the decorative structure. Diagonal lines and outward adjuncts boldly expressed the oblique pressures, and expressed them so entirely that we might imagine every bit of walling taken away, leaving a skeleton framework of rib and strut, pinnacle and buttress, through which the forces were transmitted and the fabric sustained.

I may here advert to the necessity of always showing sufficient abutments to arches. The beauty of the arch entirely rests on the apparent evidence, at least, of being sustained laterally, for an inadequate appearance of support at the springing is as detrimental to repose in design æsthetically, as actual insufficiency of abutment is to the statical structure; and this is a remark that more especially applies to the use of segmental two-centred arches, now so commonly introduced into Pointed design. No doubt the Middle Age freemasons always had this in mind, for we rarely see a segmental-pointed arch over any large apertures; generally, indeed, I have noticed them only over small doorways, &c., in the Early Pointed style. The four-centred or Tudor arch, and the semi-elliptical arch, show that our ancestors felt the difficulty of the abrupt springing, and avoided it, wherever a large opening had to be formed, by joining the flattened arch-curve to the springing by a sharper curve. A segmental arch, whether pointed or not, should be either counterbalanced by abutting side arches on the same level, or else have a sufficiently apparent abutment.

The writer has frequently noticed the weak and unsatisfactory effect an abruptly spring arch has when abutting against a slender pier, as, for example, the transept or aisle arches against the chancel piers—the latter always appearing weak, if not bent at their junction (fig. 1 A).

The manner in which arches spring from the vertical pier is more important than some architects appear to consider. Sometimes a very effective junction between the arch and pier is obtained by making the arch-mouldings stop or die against the pier, without the intervention of capital or impost mouldings, the sections of arch and pier being different. This form is common in English Gothic, and has been distinguished by Professor Willis,* in his suggestive nomenclature, as the "discontinuous" impost, though, I think, a more expressive term would be interpenetrated impost. The interscribing or profiled line produced in this way at the impost is sometimes of a most varied description, A being an exaggerated profile of the archivolt; and such an arrangement is better than continuing the same moulding to the ground, like the "continuous" and "banded" archway common in Italian Gothic, in which a weakness is manifested, it being far more consistent with constructive truth to make the pier of a plainer section than the arch-mould. A corbelled or shafted impost is often a very reasonable way of taking the under or intrados members of an archivolt. The elaborate profiling of mouldings and ribs upon square or cylindrical faces has sometimes been carried to an intricate extent. In the after-Gothics of Germany and France the substitution of angular or prismatic, for the plain upright, face has often sacrificed beauty to stone cutting.

In a series of arches like an arcade, where single supports are preferable to wide spans or large piers, a combination of arched entablature has, I think, a happy effect, giving a more varied and pleasing series of intercolumns and uprights than the customary mode of equal-spaced intercolumniation; indeed, it is a wonder the plan is so rarely adopted. Even arches may be substituted for the discontinuous and alternate entablature; the greater superincumbent weight over the minor arches being equivalent to the greater tendency of the wider ones to spread. There is a sort of rhythmical cadence in such a disposition akin to that in a pleasing melody, in which the isochronal in sound is distasteful. Where the thickness of wall will admit of it, coupled columns transversely placed is another variation, possessing, I think, a good effect; and, being less obstructive to sound and sight than heavy piers, has something to recommend it. The arched soffits could be incised or decorated with a running or other pattern, depth of moulding in such a case not being easily obtainable.

Where simplicity is an object, few types of arched construction are comparable to the Romanesque or our own Norman for breadth or gradation—I mean in shafted arcading; and these forms are more safe to follow or develope than the elaborate grouping of rounds and hollows seen in the complex arch and pier systems of the Pointed styles. What can surpass, for example, the rectangularly recessed jamb and arch-mould—really the elemental form of all subsequent elaboration; and what can be more suitable for our modern brickwork? The introduction of angular shafts and the splaying of the angles give us all that the eye and sense demand, and is infinitely more satisfying to the mind than the saw-like notching that modern brick art so revels in just now. Fig. 6 shows an Italian

FIG. 6

modification of the recessed pier of the rectangular class alluded to above, and it will be at once seen what a breadth and richness of effect can be attained by its use in any style.

All kinds of soft porous stone become hard by whitewashing them with fresh slacked lime. The lime absorbs the carbonic acid from the atmosphere, and is converted into carbonate of lime. A portion of this remains in the pores of the stone and ultimately becomes very hard.

* Mr. Fergusson thinks, with more probability, the rotunda to belong to a period nearer Constantine's age.

* Remarks on the Architecture of Middle Ages.

B. Abbott, Lith.

THE LATE M. DIDRON.

TO write the biography of a departed friend can hardly be accounted either a pleasant or desirable occupation, and it is with no small grief in the present case that I am called upon to record the acts of one to whom both architecture and archæology owe so much, and who was so comparatively little known in this country. Yet there were some few of our countrymen to whom a visit to the Rue St. Dominique and an interview with M. Didron, were as much a duty (whenever they found themselves in Paris) as an inspection of the last treasures added to the Louvre or to the Hotel de Cluny.

The following particulars have been supplied by the family, and appear from internal evidence to have been written by M. Didron himself. Under the circumstances, therefore, I give as literal a translation as possible :—

"Notice of the principal facts in the life of M. Didron—

Didron (Adolphe Napoleon), born in 1806 at Hautvillers, department of the Marne. My father was "précepteur de la commune ;" my mother, daughter of a notary of the same place. I studied Latin and Greek at Rheims, and finished my education at Paris.

In 1828 taught history in a school, also studied law, medicine, and natural history.

In 1830 I competed for a prize offered by the "Revue de Paris" upon this question—"Influence de la Charte sur les mœurs et des mœurs sur la Charte." I obtained the second prize ; my paper had for its epigraph, "La liberté est bonne à tout."

From 1829 acquainted with Victor Hugo, Charles Nodier, Sainte-Beuve, Théophile Gautier, Barye, Auguste Preault, Paul Huet, Eugene Devéria, and all the "romantiques."

Since 1829 uninterrupted studies on the national archæology. These studies were encouraged by Victor Hugo, and were due to the study of his "Notre Dame de Paris."

At the end of 1830 an archæological journey on foot through the whole of Normandy.

In 1831-1833 articles upon the "Archæology of the Middle Ages," written for "l'Européen," founded by M. Buchez.

With Jeanron, Barye, Barre the elder (medallist), Paul Huet, Gigoux, Wattier, Laviron, &c., I founded "La Liberté," an art journal, of which I wrote the prospectus, and a part of the first number. I wrote successively archæological articles in the "Revue de Paris," the "Revue du Progrès Social," "Revue Française," and "L'Artiste."

In 1832 licencié-es-lettres.

In 1834 report to M. Guizot, Ministre de l'Instruction Publique, upon the study of national archæology, published in the "Revue Française."

1835. Appointed secretary to the "Comité Historique des Arts et Monuments" which M. Guizot had just established, and which had for members, MM. Vitet, Victor Hugo, Montalembert, Sainte-Beuve, Ampère, &c.

1835. Description of the sculptures of the Cathedral of Paris, in the "Revue de Paris."

In 1836 archæological journey in the centre and south of France.

1837. Studies on the Cathedral of Chartres, by order of the Ministre de l'Instruction Publique ; report published in the "Moniteur." I found among the thirteenth century sculptures at Chartres the statue of Liberty.

1838. A course of lectures upon the national archæology given at the "Bibliothèque Royale." The course was free and public.

1839. Nominated to post of sub-librarian to the "Bibliothèque Royale." The Conservatoire refused to execute the commands of the minister, M. Salvandy, and I was, therefore, never installed.

1839-1840. Archæological journey at my own expense to Greece, to Thessaly, to the Météores,* to Macedonia, Mount Athos, and Constantinople. An account of this journey will be found in the "Annales Archæologiques."

1840-1847. "Bulletin Archæologique du Comité Historique des Arts et Monuments." 4 vols. octavo, entirely edited by me.

1841-1843. Other courses of lectures on the national archæology, given at the "Bibliothèque Royale." These, like the former, were free and open to everybody.

In 1843 publication of the "Histoire de Dieu," one vol. quarto, with wood engravings. This was the first work published upon Christian iconography.

1843. Archæological journey in Germany—Munich, Nuremburg, Ratisbon, and the banks of the Rhine. This journey was published in the "Univers."

1844. Commencement of the "Annales Archæologiques," which I wholly edit. I have had the assistance of the principal archæologists, both French and foreign. The "Annales" are au encyclopædia of the arts of the Middle Ages, viz., architecture, painting, sculpture, music, poetry, drama, ritual, metal work, &c.

In 1845 establishment of the Archæological Library, at first conducted by my brother Victor Didron, and *now* by me.

1845. Publication of the "Manual d'Iconographie Chrétienne," 1 vol. octavo.—Nominated Knight of the Legion of Honour by M. Salvandy, Ministre de l'Instruction Publique.

1846. Archæological journey in England, published in the "Annales."

1848. Ditto in Spain, partly published in the "Annales."

1848-1858. Ditto in France, Belgium, Germany, England, Holland, Switzerland, and Italy, all more or less published in the "Annales."

1849. Establishment of a manufactory of stained glass.

1849-1859. Sundry windows in the mediæval, renaissance, and modern styles for the cathedrals of Langres, Soissons, Nantes, Aix-en-Provence, Paris, Aire sur l'Adour, Digne, Lisieux, St. Omer, and for churches at Dunkerque, Lille, Abbeville, Rheims, St. Quintin, Luneville, &c. For the Duc de Noailles at Maintenon, and for the Comtes de Mérode, Colbert, Daru, d'Harcourt ; commissions were also executed for Westphalia, Holland, and England, and at Rome for the Cardinal Antonelli.

In 1852 I was deprived of my place of secretary to the "Comité Historique." At the same time Victor Hugo, Montalembert, and the Duc de Luynes were also turned out.

In 1854 I was named member of the jury of the competition for the new Cathedral at Lille. I obtained that all the designs should be made in the French style of the thirteenth century. The church is now being built in that style.

1854. Named Knight of the Order of St. Gregory the Great.

1855. Exposition Universelle ; a silver medal of the second class for stained glass.

1857. Named honorary member of the Royal Institute of British Architects.

1856-1857. Agent for the Arundel Society ; addition to the library of their casts.

1858. Addition to the library of the photographs of the pictures of the old masters before Raphael.

1858. Establishment of the bronze foundry.

1859-1867. Execution of sundry objects in bronze for ecclesiastical purposes.

1862. Medal for stained glass at the London Exhibition.

1867. Silver medal at the Paris Exhibition ; this was the highest prize that was given for stained glass."

Here ends the autobiography. It only remains to add that M. Didron died of consumption on November 13.

It is rarely that we find so succinct and so lucid an autobiography as the one we have just been reading. What an example does it afford us of untiring industry and energy, not only in obtaining a position in life (for many of us do that), but also in acquiring a reputation both scientific and literary. It would be well for all of us if, at the end of our career, we could point to a life as well and as usefully spent as that of M. Didron.

M. Didron was never married, but adopted his nephew and niece. The former, M. Edouard Didron, accompanied him in several of his journeys, and, having had a regular artistic education, the cartoons for the glass (and, I believe, most of them were due to him) were rather better than what we obtain in a general way in England. He began a history of stained glass in the "Annales," and still carries on the manufacture.

The archæological world will be glad to hear that it is proposed to continue the "Annales Archæologiques," M. Alfred Darcel and M. de Guilhermy, both frequent contributors, having offered their assistance.

A few words may be added concerning M. Didron's three works—"L'Histoire de Dieu," the "Manual d'Iconographie Chrétienne," and "Les Annales Archæologiques."

"L'Histoire de Dieu." Paris, Imprimerie Royale, 1843. This is perhaps the best known of M. Didron's works, having been translated and published in Bohn's illustrated library. The introduction contains the somewhat contestable assertion that the Miroir Universelle of Vincent de Beauvais is to be found sculptured, with more or less omissions, in the statuary of the Cathedral of Chartres. The author then defines the "glory," the "nimbus," and the "aureole," and gives their history. He tells us that the nimbus goes round the head, the aureole round the body, and that when both nimbus and aureole occur together, they become the "glory." The next divisions treat of the various representations of God the Father, God the Son, and God the Holy Ghost, also, lastly, of the Most Holy Trinity. The woodcuts, of which there are no less than 150, are drawn by M. Paul Durand.

It was M. Didron's intention to have completed the work in a second volume, which would have contained "L'Histoire de l'Ange" and "L'Histoire du Diable." A few chapters of "L'Histoire de l'Ange" appeared at a subsequent period in the "Annales," but the scheme was never completed.

"Manual d'Iconographie Chrétienne, avec une Introduction, et des Notes." Par M. Didron. Paris, Imprimerie Royale, 1845. The origin of this book is very curious. When M. Didron was travelling in Greece, he was astonished to find that all the paintings and figures with which the churches were filled exactly resembled one another. At last he got hold of a painter at work, who showed him a book which told the reader how to mix his colours and prepare his grounds, how to paint certain stories, how to arrange these stories in their proper places in the church, and, lastly, how Our Lord and the Blessed Virgin were to be represented. It turned out that the work itself was ancient, but had been enlarged and corrected—the manuscript that M. Didron was shown was about 300 years old. The painter very naturally refused to cede his book, and, after many delays, a copy was taken from another MS., from which a translation was made by M. Durand, the companion of M. Didron. It is this translation, with very copious notes by M. Didron, which forms the "Manual d'Iconographie." The text of the Greek MS. is exceedingly curious, especially the description of the paintings representing the parables of Our Lord ; but the chief value consists in the notes, to which, unfortunately, there is no index. No architect who goes in for the art portion of his profession should neglect to study this book most attentively, for it will give him the key to the whole science of Christian Iconography. It has been published so long ago that I am afraid that it is but little known to the younger members of the profession.

The "Annales Archæologiques," commenced in 1844, have now reached their twenty-fifth volume. As M. Didron says in his memoir,

*These are monasteries perched on almost inaccessible rocks.

they form an encyclopædia of the arts of the Middle Ages. It would be perfectly impossible to give in this notice names of the contributors, comprising, as they do, all the most distinguished archæologists of Europe. M. Didron was a frequent contributor of original articles, and every number contains sundry small notices from his pen. On one point it certainly puts to shame all our English archæological and architectural publications, and that is in the beauty of the engravings with which the "Annales" are illustrated. There is scarcely one bad plate to be found in the whole series. M. Didron indeed judged truly of the "Annales" when he said to the writer of this notice, "I have done something in this life: when I die, the five-and-twenty volumes of the 'Annales' will be my monument."

W. BURGES.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE ordinary meeting of the members of this Institute was held on Monday evening 1st, Mr. Daniel Brandon, vice-president, in the chair. M. Weale, of Belgium, author of various works on architecture, was unanimously elected as honorary and corresponding member. Mr. Charles Innes, of Whitehall, was elected a fellow: and Mr. John Hebb, of Tollington Park, and E. H. Bowi, of Harrogate, were elected as associates.

Professor Donaldson announced a donation of £500 from Mr. Tite, M.P., president, to the Library Fund, for the purchase of selected works on architecture by English and foreign authors, of which the library is at present deficient. A special vote of thanks was passed to Mr. Tite for his munificent gift, and it was referred to the council to consider an appropriate form of recognition of the president's liberality and warm interest towards the institute.

MR. W. B. SCOTT read a paper "On Mural Paintings for Pevkill Castle, Ayrshire." The subject of the pictures, of which the cartoons or preliminary drawings necessarily made, when the artist has to paint on the wall itself, were exhibited, is taken from "The King's Quair," or King's Book, by the first King James of Scotland, being already partly executed as the decoration of the walls of a circular staircase, leading to the present drawing room of Pevkill Castle, and the method employed is a kind of tempera. The author could not call it encaustic, since heat is not applied to fuse the colours into the plaster. The medium used is a solution of wax in turpentine, and the use of this medium has been an experiment, the results of which Mr. Scott thought might be worth a few minutes' attention. Having given a general description of this old peel-house or castle, as it existed up to the beginning of the seventeenth century, Mr. Scott went on to state, that this interesting old place was left to go to ruin at the end of the last century, and when the late Mr. Spencer Boyd repaired and inhabited it a few years ago, he had to build an entirely new staircase more commodious than the old, although retaining the novel form proper to the date of the house. It was for the decoration of this circular staircase these cartoons were drawn, and in carrying out the commission, the artist being allowed to choose his own subject, selected an early Scottish poem, written by the first James of Scotland when a prisoner at Windsor in 1420, on his love for Jane, grand-daughter of John of Gaunt—a poem in six cantos in imitation of Chaucer, and one of the most perfect and beautiful productions of that epoch, although very little known. The pictures, six in number, illustrated the several cantos, which Mr. Scott described. The first and second of these pictures were painted in the summer of 1865, the medium used being, as already stated, wax dissolved in turpentine, a medium frequently used in Italy for the common decoration of which one sees so much there, and adapted by Mr. Parris in going over the pictures in the cupola of St. Paul's. This medium Mr. Scott tried on one of the figures of artists for the museum at South Kensington, and, as he was expressly required at Pevkill to paint on the wall itself, he determined to try it on a larger scale. The effect was all that could be wished. He explained that when employed on a surface not previously touched the turpentine is absorbed with a portion of the colour and the oil in which the colours were originally ground, while the wax retains a great amount of luminosity in the tints with the uniformly dull surface absolutely necessary in wall-painting. The unity of surface is attained, a characteristic of fresco and the simplest tempera painting, with greater brightness in the colours. The pigments used were not restricted to earths, as in fresco, but embrace nearly all the wide range now furnished by the colourmen, without any perceptible chemical change resulting, the medium employed penetrating the plaster sufficiently to protect the colouring matter on the surface from contact with the lime. Notwithstanding this, it was added that the part of the wall which is exposed to the south wind, the wet wind in that locality, has, in the course of the two last severe winters and wet springs, shown symptoms of decay. The great enemy of painting in this country is damp, and it appears that no external wall, without stoothing or other ventilation, is a safe surface for the artist. Whether the wall in question had never been allowed to become dry during the four years from its construction to the time of the artist commencing his operations, or whether the wet soaked through from without in spite of the Portland cement with which it was painted, from the first was a question no one seemed able to solve. The remaining portion of this exposed south side has been lined with sheets of zinc, on which the future pictures will be painted, with what result has yet to be seen. With regard to the remarks on a former occasion, relating to fresco, by a gentleman who urged the superiority and desirability of that method, he was afraid that his assertion that it would never be practised again in this country, or perhaps anywhere else, might be construed as an effort at self-defence, the work he then submitted to the members being rather easel pictures than wall decorations, having comparatively little of the simplicity induced by tempera painting and necessitated by fresco. Such, however, was not the case, but a deliberate opinion, the result of many years' consideration. He did not mean that we should never see little pieces of fresco on lath and plaster frames, as we may see books illuminated by hand, or imitations of ancient enamels; perhaps we might even see fresco on a small scale applied to some purpose by some one who persists in conjuring by an old form of incantation, and if the artist abstains from all colours but those composed of earths—if he has ten years to prepare his lime, if his wall is thoroughly protected and ventilated, if the weather is every day favourable, and if the artist has had a lifetime of practice—perhaps once more we might have a good result. But this is certain, fresco has had a revival of twenty years in England and forty in Germany, and all the best artists in both countries who have practised it—Kaulbach in Germany and Maclise in England—have gladly resigned it for the newly invented silica medium. In Italy itself, continued Mr. Scott, the reign of fresco was little more than a century. All the earlier works remaining are tempera. Not many years ago it was not unusual to hear people talk of all Italian wall-paintings as fresco, but it is quite certain no such thing exists. When the commission was appointed to consider the application of painting to the new Houses of Parliament, in 1841, Cornelius, a German artist residing in Rome, was called over in November of that year, and Prince Albert, who was at the head of that commission, seconded the views of his compatriot, and fresco was determined upon. Tempera and the early works were scarcely ever alluded to, and, while the Munich frescoes, all the open-air ones at all events, were begining to peel off, English artists, who had never painted anything but genre pictures in oil, produced those examples now going to pieces in the so-called Poets' Hall. Fortunately, the silica process was shortly after discovered, so that Maclise, the greatest of English historical painters, and one of the greatest European artists, has been freed from the waste of energy and danger of premature decay in painting his two great works, "The Field of Waterloo" and "The Death of Nelson"; but the last years of Mr. Dyce were embittered by the difficulties, delays, and repaintings involved in this primitive process, fitted only for a dry climate and a summer of continuous equable temperature.

PROFESSOR DONALDSON, in proposing a vote of thanks to Mr. Scott for his communication, referred to the unsatisfactory results which had attended fresco painting in this country, notwithstanding the most elegant researches on the part of the late president of the Royal Academy, as to the processes of preparation, both of the surface of the walls and of the colours to be used, in the case of the decoration of the corridors, &c., of the new Houses of Parliament. It seemed that all the endeavours of artists to conjure the difficulties of fresco painting, so as to render it imperishable, were always frustrated. He thought we might look with greater hopes to the new process of water-glass painting; but even when that process was adopted there was a damp which covered the surface, which, though not chemically affecting the picture itself, was prejudicial to the just appreciation of it as a work of art. Under these circumstances it was gratifying to find that a gentleman like Mr. Scott, with his large practical experience and knowledge of his art, had adopted a process which he thought was calculated to be successful in this country.

MR. SCOTT remarked that the effect upon the surface of the pictures in water-glass, mentioned by Professor Donaldson, arose from the accidental circumstance of too great a quantity of silica having been dashed upon the surface with a large brush, instead of by the more careful method of using a syringe for the purpose, and that tended to give a whitish bloom to the surface of the picture. He believed the opinion of Mr. Maclise was, that that effect could be removed without injury to the painting.

PROFESSOR KERR remarked that the practical question of damp in walls was one which ought not to be passed over by a body like this without some consideration. They all knew very well that a stone wall, even when built of granite, will draw the wet through several feet thickness. It seemed to him the best advice, with regard to walls on which these kind of paintings were to be placed, was, in his opinion, so far as he had paid any attention to the subject, to treat them with one or other of the recognized stone preservative processes—probably that of Ransome's was the best for the purpose. If that were not successful, it would be desirable, for the sake of the paintings, to coat the outside walls with some material which was impervious to wet, as paintings of this description should not be allowed to go to ruin from the unfavourable state of the stone wall on the outside. With regard to the water-glass pictures in the Houses of Parliament, he thought it would turn out eventually a mistake to have used that material at all, because silicate of potash has a very strong attraction for the moisture of the atmosphere, which might produce a damaging effect upon the pictures, because when the water-glass was treated with chloride of lime there was a large quantity of salt thrown off, and until that was got rid of there was a strong tendency to absorb water. With regard to the material Mr. Scott was employing in the execution of these pictures he had no opinion to offer, but he strongly advised him to reconsider the idea he had formed of painting any portion of them upon plates of zinc. It would, in his opinion, be preferable to remove the portion of wall which showed appearances of dampness to a sufficient depth and replace it with a composition of a more satisfactory kind.

MR. CHARLES BARRY complimented Mr. Scott upon the successful treatment of his subject in the disposition of his pictures, in this, as in the former case, which he brought before the Institute. Looking at the instance now before them, he hoped Mr. Scott would be able to find some means of protecting the inside surface of the walls from damp, without depriving the external wall of its original stout character, and not sacrifice the glory of the exterior by coating it over with a foreign material. There were two ways of meeting the difficulty; the most obvious was, if they had any apprehension from the porosity of the material that moisture would get through, it was not a difficult thing when the walls were to be covered with works of art, to make an inner wall with interstices of space between it and the outer wall. He agreed with Professor Kerr in the caution he had given as to the contemplated use of zinc plates.

MR. W. WHITE, after some general remarks on the treatment of mural paintings, observed that he had seen several of the pictures of Mr. Gambier Parry, which he understood to be a sort of tempera, and he did not know of an instance in which they had failed. In reference to the use of zinc plates, he had been informed by decorators in painting that, by thoroughly scrubbing the surface of the metal, and either gilding or silvering it over before the paint was applied, a very excellent and durable surface for painting was obtained. A further suggestion was that zinc paint should be used instead of lead paint, inasmuch as the latter would set up a galvanic action which deteriorated

REVOLVING GAS AND AIR WASHER.

Fig. 1

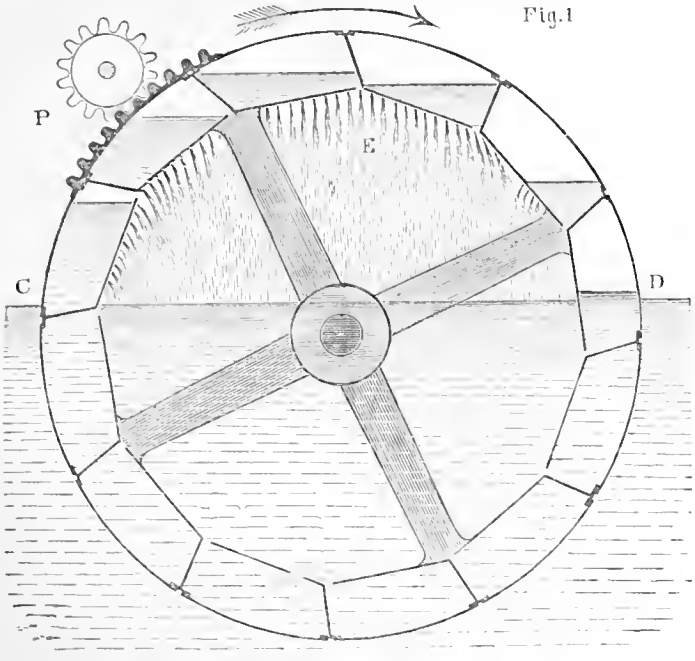

Fig. 2

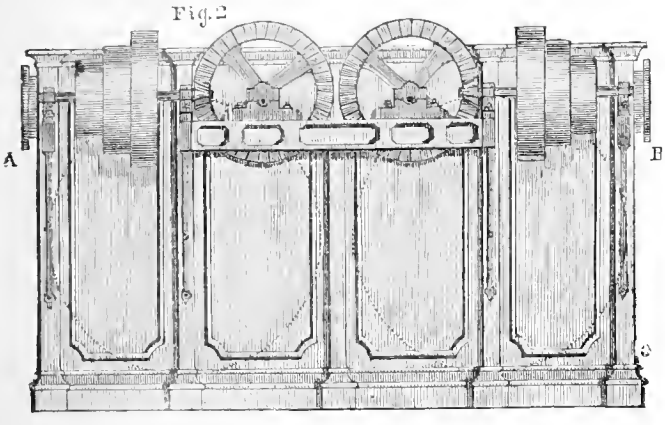

the surface. He agreed that the most efficacious way of keeping damp from mural pictures of this kind was the plan of double walls, in which case any dampness that penetrated the outer wall dropped down and left the interior wall, ventilation being duly attended to, perfectly dry.

MR. BARRY hoped the notion would not be endorsed by the meeting that gilding or silvering the zinc plate would prevent destruction of the surface by galvanic action, as a greater amount of galvanic action was set up between metals of different degrees of oxydation.

After some further conversation, the vote of thanks to Mr. Scott was unanimously passed.

A communication from Mr. J. McLean, descriptive of the old roof recently discovered over the nave at West Church, Stirling, N.B., which had been obtained upon the application of Professor Donaldson to that gentleman for any information he possessed on the subject, was then read and thanks voted to the author, after which the meeting adjourned.

REVOLVING GAS AND AIR WASHER.

WE very recently [BUILDING NEWS, No. 674] gave a general description of a new revolving washer for removing impurities from gas in the process of manufacture, and also applicable to the purification of air, the invention of Mr. John Reid, Engineer, and Manager of the Edinburgh and Leith Gas Company. We now give two illustrations of this highly valuable contrivance, for which we are indebted to the courtsey of the inventor. "The leading idea of my improved washer," says Mr. Reid in his pamphlet, "is to substitute a horizontal, instead of a vertical passage for the gas while being submitted to the action of the shower of water, whereby it should undergo a thorough shower-bath from a copious stream of water jets, falling some 20in. in an elongated horizontal chamber, instead of 30ft. in height; and that this should be effected without in any way presenting obstruction to its free passage, or throwing any back pressure on the retorts. The apparatus consists of a cast-iron close cistern, with some external panelling and architectural ornament, measuring about 14ft. long, 12ft. wide, and 6ft. in depth, having a longitudinal vertical partition dividing its interior into two equal sized chambers, 14ft. long, 6ft. wide, and 6ft. deep. In each chamber is fitted a revolving hollow cylinder, some 10ft. long, and 5ft. external diameter, with strong wrought-iron axles, and lignumvitæ bearings fitted inside the principal chest. The periphery of each cylinder is built all round with cast-iron buckets, twelve in number, in the manner of a water-wheel, with this difference, that, with the exception of air-slits in the outside of each bucket, they are close all round the outside circumference. The interior surface of the buckets, about 10in. less in diameter, is closed in with thin cast-iron plates, perforated with holes an inch apart, and one quarter inch diameter. Each cylinder is mounted at the front end with a spur wheel, actuated by pinions within the chest, for giving to each a slow rotary motion, at about one and a half revolutions per minute. The pinion shafts pass by a stuffing-box to the outside, and are mounted with wheel gearing and driving pulleys, which are driven by engine power. The chests being charged with water to the height of a few inches above the centre of the axles, and the cylinders being set in motion, in the direction of the arrow, fig. 1, which represents an end section of the cylinders, each bucket emerging from the water line CD discharges a copious shower of water through the internal perforated plates into the interior vacant space of each cylinder, and each bucket thus discharging its contents is nearly emptied by the time it reaches the surface of the water on the opposite side, as shown on fig. 1. Fig. 2 is a front elevation of the machine, showing the outer driving gearing, and the inlet and outlet passages for the gas, AB. Fig. 4 is a cast-iron plate or screen, closely fitting the sides and top of the chest, and with a semicircular cavity accurately fitting the periphery of the front end of each cylinder, which is turned truly for this purpose. The two lower points of this plate dipping a few inches into the water compels the stream of gas entering at A to pass only through the interior of each revolving cylinder. On discharging at the back end of the first cylinder, a suitable aperture allows the gas to cross the middle partition of the chest, and enter the interior of the second cylinder, and after passing forward through its interior it escapes by the outlet at B. The volume of water thus brought up from the lower depths of the vessel amounts to 225 gallons per revolution for each cylinder, being 450 gallons for the two, and the speed making 1½ revolutions per minute. There are 675 gallons, or three tuns, of water per minute showered by this apparatus upon the gas passing through it in that period of time. To provide this copious shower in the ordinary washer would require appliances of a formidable character, in the way of pumps and other tackle. Here nothing of this kind is required; while the motive power requisite to lift the water about 18 or 20in. in this machine is less than one-twelfth of that required to lift the water 30ft. in the old form of washer. When the water is charged, it is only done partially, and the ammoniacal saturation is never allowed to fall lower than 4 deg. to 5 deg. in strength, and it is usually worked up to 10 deg. or 12 deg. before it is run off; and in this condition it is sent to the chemical manufacturer for the production of sulphate of ammonia, its relative value being measured by its strength. The highest strength of this liquor attainable with advantage by the old washing apparatus rarely exceeds 5deg. or 6 deg."

SCARBRO' CLIFF.

THE shareholders of the Scarbro' Cliff Bridge Company held a meeting the other day, the mayor presiding, to discuss a project for forming a subway under the face of the cliff, which is the property of the company, at the south end of the Spa, to connect the Spa and the Esplanade. The proposition was made by Messrs. Shelford and Robinson, engineers, Westminster, who submitted plans to the meeting. The proposed subway would consist of a tunnel, up and down which a train of carriages would pass, propelled by hydraulic power. The train would be capable of conveying forty persons at once, and could be worked so as to take 600 passengers per hour. The cost was not stated. However, the proposition, after a long discussion, was rejected on the motion of the Rev. Dr. Evans. One or two of the shareholders warmly advocated the scheme, while Mr. Hunt (of the Prince of Wales Hotel) spoke to the desirableness of some means of easy communication between the Spa and South Cliff, and contended for the superiority of certain plans of his own, viz., a surface road, which he was prepared to guarantee could be formed in three months, and the cost of which he was also prepared to raise. It seems to be generally felt that some such undertaking is desirable, and would be highly advantageous in a public point of view. Both proposals, however, have been abandoned for the present.

THE CO-OPERATIVE MOVEMENT IN THE BUILDING TRADES.

ON Tuesday evening a general meeting of operative house painters was held at the Grafton Hall, Grafton-street, Fitzroy-square, for the purpose of hearing from Mr. A. Walton his plan for the formation of a co-operative building society amongst the different branches of the building trades. There was a numerous attendance. Mr. J. W. Carter, of the Painters' Central Society, occupied the chair, and briefly introduced Mr. Walton to the meeting. Mr. Walton then proceeded to detail his plan at some length, dwelling upon the superior advantages to the trades of the co-operative system over the simple trades' unions, however necessary those unions were under the present competitive system. He pointed out how easy it was for operatives in the building trades, by uniting together, to establish a building company on a scale that would enable them to undertake on their own account any contracts, however large. He thought the present time especially suitable for making the attempt, when the principles of co-operation were taking root in the public mind. He contended the objections urged against trades' unions could not exist against co-operation, which would find many

supporters amongst the middle and higher classes of society. He proposed that the shares should be £1 each, and when 500 men had taken up shares, business could be at once commenced After some discussion, Mr. Walton's plan was endorsed by the meeting, upwards of 50 members subscribing for shares, and a committee of five was appointed to act with similar committees to be appointed by the other branches of the building trades. A vote of thanks to the chairman and Mr. Walton concluded the proceedings.

ARCHITECTURAL ASSOCIATION.

CONCRETE CONSTRUCTION.

THE discussion on Mr. J. Tall's paper on Concrete Construction delivered before the Association on the 6th inst., took place at a meeting of the Association on Wednesday evening, Mr. R. Phené Spiers, the President, in the chair.

The CHAIRMAN remarked that, since the delivery of Mr. Tall's paper, a number of gentlemen connected with the Association had, at the invitation of Mr. Tall, paid a visit to one of the concrete buildings now in course of construction at East Sheen, from designs by Mr. Bloomfield. He regretted that the day was not so favourable as they could have wished. However, the party had an opportunity of going carefully over the building, and he might say that, on the whole, they were well pleased with the result. He called upon Mr. J. D. Mathews to open the discussion.

MR. MATHEWS said that he did not think they were called upon to discuss the merits of concrete as a material, about which everybody was agreed, but rather the adaptability of the material for the purposes of house construction. There were various methods of constructing with concrete. Some were good but expensive, and others were good but intricate. The great point, he conceived, was with regard to the cost. If Mr. Tall can prove that his mode of construction was cheaper than brick, then there was a likelihood of its superseding brickwork. Another great point was getting the foundation fixed, and he would like to ask Mr. Tall, suppose a sinking was to take place in one part of the trench, what would be the result? Again, there was the mixing of the concrete, which was a very important matter. What guarantee had the architect that the material would be mixed in proper proportions. If it were not properly mixed, the responsibility would be thrown upon the architect, and any defects laid to him. The cost of the apparatus was very considerable, and, if it had to be added to the cost of the building, would give us a very expensive house. How was this to be got over? Mr. Mathews admitted that the method had many advantages: there was, for instance, greater warmth in concrete than in brick, and the walls are both damp and fire-proof. He thought we were coming to solid floors—they were very desirable. He therefore approved of concrete floors. In France even bed-room floors were solid, and it was found that they were quite as warm as those here. Then came the question of the artistic treatment of concrete. This was a very difficult point; but he had no doubt that architects would in time find their way to adapting concrete to ornamentation. With concrete we lose the colour which we obtain with stone and brick. This would have to be supplied in some way. The material, if left rough, would present a very uncomfortable and cheerless appearance. The walls, however, might be made in geometrical forms, or in various devices. Terra-cotta might also be used for ornament. He strongly objected to facing with brick, and would rather cement the front. In conclusion, from what he had seen of Mr. Tall's apparatus, he had very little fear of using it when opportunity offered.

MR. BLASHILL said that he had taken considerable interest in this subject, though he had not been able to go down to East Sheen. We had stone and timber and iron as building materials, and concrete might be regarded as a fourth material. He could not, however, accept Mr. Tall's statement that the cost of concrete was one half the cost of brick. In some places stone was the cheapest material that could be used, in others timber, and in others, where clay was abundant, brick was the cheapest. Of course where there was plenty of gravel and nothing else, there concrete would be the cheapest. Still he thought that concrete work might be done at considerably less cost than other materials. But Mr. Tall had given no figures on this point Nor could he agree with Mr. Tall that concrete was ten times the strength of brick. In no sense that would be valuable to the architect. Was this so? The apparatus was very ingenious, but we could not make the rooms of our houses all one size, and what was to be done in this case? He also felt the difficulty of getting workmen to exactly follow out the instructions as to mixing the material. He would not trust to a contractor to do this. The matter of keeping out damp, the getting rid of woodwork, the power of increasing the walls to any thickness, instead of having to jump down from 9in. to 14in., and the greater cheapness of the labour, were all very great advantages.

MR. W. F. POTTER said he was an advocate of concrete, and denied that it was open to the charge of being sham building. He would like, however, to know what was the cost of the apparatus. He had recently received two estimates for the construction of some houses—one estimate was for concrete, the other for brick, and he was surprised to find that the concrete was much dearer than the other. He believed the estimate emanated from Mr. Tall, and he was told that the reason of the greater cost was the expense of Mr. Tall's apparatus, which was about £100.

A number of other questions were put to Mr. Tall by various gentlemen present. Several of the speakers reiterated that the scaffolding machine was only serviceable when 20, 30, or 40 cottages had to be constructed, but cottages generally went in pairs or so, especially in the country, and in these cases the apparatus would be no advantage, owing to its cost. Another point repeatedly mooted was the difficulty of knowing when the material had been properly mixed. There was nothing better than good concrete, remarked one speaker, but bad concrete was worse than rubbish.

MR. TALL, in answer to these and other questions, remarked that most, if not all, of the objections mooted had, he thought, been completely answered in the paper which he read before the Association. He observed that his apparatus was not made to build one, or two, or three houses merely, but 20, or 30, or more. Like all models, the expense was in the first instance. But he would guarantee, that, with 20 or 30 houses to construct, his apparatus would save its cost in the first two houses built. As to the relative cost of brick and concrete, there was no part of England where he would not find the material for concrete construction; where he could not get gravel he would find stone, which he would crush with proper machinery, at one half the cost of brick. He repeated that those who had only a couple of houses to erect would derive no advantage from his apparatus in the matter of cost. The walls could be extended to any length that might be required by adapting the panels of the apparatus. He was ready to prove that concrete was not only ten times, but fifty times, the strength of brickwork. He did not recommend concrete roofs, nor would he make concrete floors for small cottages, because it could not be done so cheaply, unless the material was close at hand. He thought there was no difficulty about the mixing. The walls could not be carried up unless the cement was good, and of the proper mixture, and then a common labourer could do the work perfectly. It had been remarked that the houses at East Sheen presented a very rough and honeycombed appearance. The reason was that the material should have been passed through a finer screen; concrete may be made rough or fine just as it is passed through a rough or a fine screen. For the rest, he referred to his recent paper, and also to the pamphlet which he had published on the subject.

The CHAIRMAN said that, as to the durability of the concrete, the proper proportions in mixing, and other points, had been satisfactorily settled by tests. It appeared to him that the most serious objection to the use of concrete was the fact that it admitted of no alterations being made afterwards. The material was so hard that it turned the chisel. As to decoration, some material would require to be used, but he hoped it would not be stucco. The difference in appearance of the surface, often on the same beds, at East Sheen he noticed as serious defects, though Mr. Tall had explained this by stating that the concrete should have been passed through a finer screen. The chairman concluded by moving a vote of thanks to Mr. Tall for the trouble he had taken to give the members every information on the subject of his patent.

HOUSE PAINT.

A NEW preparation of house paint has been invented by M. Hugoulin, principal chemist to the French Navy, by which one can prepare, in a few hours, as much paint as is required, without any other utensils than simple small tubs of metal or wood of sufficient capacity. The best paints usually employed in house painting, and which preserve best the wood, have for bases white lead, minium, oxides of zinc, and lamp black. They are not, as in other paints, simple mixtures of drying oil and mineral substances in powder, but intimately blended compounds, in which the elements are combined without chemical double decomposition.

To demonstrate this, the inventor forms, in any vessel, a liquid paste, perfectly homogeneous, with water and a certain quantity in powder of the substances indicated in the following table:—

For 1000 grammes of zinc white we can employ	300 or 352 or even 400	grammes
,,	grey oxide of zinc 150 to 180	,,
,,	white lead 150 to 180	,,
,,	red lead 50 to 60	,,
,,	lamp black 1000 (thereabouts)	

In this mixture the necessary quantity of linseed oil is added, in order to form a body colour worked up by the ordinary means.

OBITUARY.

The death of M. Claudet, the eminent photographer of Regent Street, is announced. The deceased first introduced into this country the old daguerreotype process, in the year 1839. He was the inventor of several instruments, and made various useful discoveries in connection with his art, and brought the stereoscopic pictures to great perfection. He was elected a Fellow of the Royal Society in the year 1853, and so recently as 1865 was decorated a Chevalier of the Legion of Honour.—Theodore Rousseau, one of the most celebrated landscape-painters in France, and a constant exhibitor, is dead. The event took place at his house at Barbizou, on the skirts of the forest of Fontainebleau, whence he drew his inspiration. M. Rousseau was only fifty-five years of age.

Mr. Doyle, better known as "H.B.," celebrated as a political caricaturist, died on Thursday, the 2nd inst. His likenesses of Sir Robert Peel, the Duke of Wellington, Sir Francis Burdett, Disraeli, and other public characters, have never been equalled. His works caused an extraordinary amount of public interest from 1829 to the appearance of "Punch." It was his son who designed the inimitable and familiar frontispiece of that periodical, the well known "Dicky Doyle," of "Pips his Diary," and "Brown, Jones, and Robinson" celebrity.

Mr. Adam Stark, the well-known antiquary of Gainsborough, died in that town, on the 31st ult., at the age of eighty-five. He was the author of "The History and Antiquities of Gainsborough," "History of the Bishopric of Lincoln," "Observations on Stonehenge," &c. Mr. Stark was for many years postmaster and a bookseller at Gainsborough.

The annual meeting of the Bath School of Art was held on Wednesday evening, when the prizes awarded by the Science and Art Department in connection with the South Kensington Museum were distributed to the pupils. The Mayor (Mr. W. Hunt) presided, and briefly introduced the business by expressing his regret that Bath did not possess a public library and a gallery of paintings. He thought there would be no difficulty in establishing the former, though he was afraid that the cost of the latter would be somewhat beyond what a provincial city could be expected to afford. In the absence of these, the next best thing was a School of Art, such as the city possessed, and he was glad it was in such a satisfactory state.—Major Allen, the president of the institution, presented the financial statement, stating that the most satisfactory feature in the school was the fact of the great interest taken in it by the artizan class, who formed the mainstay of the institution. At the same time he regretted that there was a debt owing of £145, occasioned by the purchase of the new premises, and the alteration of the same. The Mayor then distributed the prizes to the pupils, and the meeting was brought to a close.

Building Intelligence.

CHURCHES AND CHAPELS.

A new Russian church, built by the liberality of various members of Russian nobility, has just been consecrated at Pau. The interior is very handsomely decorated. The paintings, on cedar, on a gold ground, framed in the iconostasis, were executed by a celebrated artist of St. Petersburg.

The little church of Scarrington-with-Aslockton has lately been restored. A south aisle has been added, and the interior generally renovated. The church will now seat 200. Mr. J. H. Fakewell is the architect, and Messrs. Marriott, Wartnaby, and Scott, of Nottingham, have carried out the works.

A new Independent chapel has been opened at Blandford, Dorset. It is in the Gothic style. The architect was Mr. Stent, of Warminster, and the builder Mr. Walden, of Christchurch.

The parish church of Ashton-under-Hill has been re-opened after restoration. The alteration consisted in clearing away the schoolroom, and lengthening the aisle to the extent of two bays in the arcade, and repewing the church. The space within the altar rails has been paved with Maw's encaustic tiles. Mr. Baker, of Birmingham, was the architect, and Mr. C. Ancill, of Overbury, the builder.

The new church has been commenced at Dinnington, Yorkshire. Mr. R. Charles Sutton, of Bromley-house, Nottingham, is the architect; Mr. Cawthorne, of Retford, the builder.

On the 29th ult. the first stone of a domestic chapel attached to Exton-house, the seat of the Earl of Gainsborough, was laid by the Bishop of Nottingham, with the prescribed ritual of the Catholic Church. The new chapel includes a spacious crypt, which will form the family burial place. The architect is Mr. Buckler, of Hereford-square, London.

The memorial church at Constantinople, as designed by Mr. Street, is rapidly approaching completion.

The foundation stone of a new Primitive Methodist Chapel has been laid at Old Shildon, Durham. The chapel will be 60ft. long, and 40ft. wide, and will accommodate 800 persons at a cost of £1,500. Mr. Herbert Fippard, of York, is the architect.

The new church of St. Clement, Wrinston, Lancashire, was consecrated on Saturday, by the Bishop of Manchester. It is in the Geometrical Decorated style, and will seat 300 persons. Mr. J. M. Taylor, of Manchester, was the architect, and Mr. M. Foggett, the builder. The building at present consists of a chancel, nave, and south aisle, with arrangement for a future north aisle to seat 200 more persons.

On Tuesday week the Bishop of Salisbury consecrated a new church for the hamlet of Milton, and the adjacent district. The style is thirteenth century Gothic, and the building is 84ft. long by 40ft. wide, consisting of chancel, nave, and aisles. The building is all built of local stone, and the architectural features are of Tisbury stone. The font, which is the gift of Mr. Lilly, is also of Tisbury stone. The church will seat 360 persons, and will cost over £2,500. Messrs. Slater and Carpenter were the architects. Mr. A. Meade, of Gillingham, did the general masonry, Mr. E. Churchill the roofing, and Mr. C. Lydford the carpentry.

The first quarterly meeting of the Salisbury Diocesan Church Building Association Committee for the present year was held on Thursday week. £225 was voted in January, 1866, towards an extensive restoration of the parish church of Heytesbury. £100 was voted in January, 1867, towards the restoration and re-arrangement of the seats in the parish church of Aldbourne. £150 was voted in January, 1866, towards the erection of a new district church at Milton, in the parish of Gillingham.

A movement is on foot for the erection of a new church at Windhill, near Shipley. A design for the church in the geometric Gothic style has been prepared by Messrs. Andrews, Son, and Pepper, of Bradford. The interior will consist of a nave, aisles, and long circular chancel, and will be fitted with open benches of stained wood. The church will be constructed of stone obtained in the neighbourhood. The total cost is estimated at £4,000, and the church will seat about 600 persons.

ST. PETER'S, THANET.—A reredos has lately been set up in the parish church. It consists of a retabulum in stone, in which are sunk a central niche flanked by two quatrefoils, each filled with mosaics. The former bears a white marble cross, and the latter contain angels carrying shields, charged with the sacred monograms I H C and X P C respectively. Wheat and vine are carved on either jamb of the central niche, and the whole is surmounted by a cornice of leaves, severe in form. The wall at the sides, up to the height of this cornice, is lined with slate slabs, with a rough face, and having the Creed, Lord's Prayer, Commandments, and Apostolic Emblems painted on them in oil; below them is a dado of marble and alabaster inlay. This and the stone work was executed by Mr. Thomas Earp, the painting and mosaics by Messrs. Heaton, Butler, and Bayne, from the designs of Edward J. Tarver, architect. The whole was put up by a subscription amongst the parishioners, raised by Thomas Gray, Esq., of Orlibar-house, whose family have long dwelt at St. Peter's.

BUILDINGS.

St. Martin's New Schools, Lincoln, were opened last week. The plan of the schools is somewhat in the form of the letter H, and they comprise a boys' and an infants' school-room, each 50ft. by 19ft. with a girls' room between them, 40ft by 19ft., and two class-rooms to the north of the girls' room, each 16ft. by 14ft. The exterior of the building is faced with red bricks with black bricks introduced in bands, and in the arches over the windows. On the south-east gable is a stone bell-turret, surmounted by an ornamental iron cross. The whole of the works were designed by, and carried out out under the superintendence of Messrs. Goddard and Son, architects, Lincoln.

The New National Schools in connection with the parish church, Doncaster, were opened on Sunday last by the Archbishop of York. They have been built from designs of Mr. J. F. Teale, architect, Doncaster, at a total cost of £5,000.

The new national schools in connection with the parish church of Doncaster were opened on Sunday last by his Grace the Archbishop of York. They have been built from designs of Mr. J. F. Teale, architect, Doncaster, at a cost of nearly £5,000.

New parochial schools were formally opened at Rhayader last week, with accommodation for 120 children. Brick is the material used for the walls, and Major's dun-coloured angular tiles cover the open timber roofs. The general style of the building is Gothic, somewhat freely treated, a picturesque group harmonizing with its surroundings having been obtained. A wood framed bell cot, covered with plain tiles, and standing 10ft. above the ridge of roof, forms a prominent object in the view, and assists in giving a character to the work. Moule's patent dry-earth closets have been adopted. The architect was Mr. E. H. Lingen Barker, of London and Hereford; and the builder, Mr. William Evans, of Rhayader.

The buildings of the junior school, Uppingham, are so far completed as to insure the opening of this supplement to the main school at Easter. The carrying out of the designs of Mr. G. E. Street for the finishing the west end of the school chapel are contracted for.

WATER SUPPLY AND SANITARY MATTERS.

The Leeds Corporation Waterworks produced last year a profit of £14,367.

An experiment of some importance is now being carried on at Asnières, near Paris, on a field of about two acres and a-half in extent, and situated about 300 yards distance from the mouth of the great "egout collecteur." Two portable engines are employed daily in pumping 500 cubic metres of sewage-water into a receptacle at one end of the field. A part of this water is applied to various crops—vegetable and eereal—and the remainder is treated with chemical agents for its purification. The former application is considered as fully confirming the opinion that sewage-water may be advantageously applied either to crops or to the direct fertilization of the soil itself, without communicating any bad taste to the vegetable produets, or in any way vitiating the surrounding atmosphere. Some fine specimens of beetroot, yellow turnips, artichokes, and other vegetables thus irrigated were shown at the late exhibition on the Champ de Mars. These products were grown at Clichy, but they were not accompanied by sufficient data to render them scientifically and practically useful, and therefore the authorities of the city of Paris have set on foot the experiments already referred to, in order to obtain definite results connected with this important question. There is no question of the immense importance of the subject, and it is to be hoped that the experiments now being made will at any rate assist in bringing about some advantageous application of such precipitated matter, and thus prevent the pollution of rivers and the extermination of the fish which inhabit them. The Seine at Paris is now relieved of the sewage-water of the metropolis, which is thrown into it below the city, but, on the other hand, it still receives the impurities which are poured into it by all the sewers between Paris and the source of the river.

MALTA.—The late prolonged drought has induced the government to make extensive explorations for water in different parts of the island, especially in the sandstone at the Marsa Valley, and in the marly districts beyond the ancient city of Medina, now called Civita Vecchia. These experiments have been attended with a very considerable amount of success. Numerous shafts have been sunk at the Marsa, which already yield upwards of 400,000 gallons a day, and it is calculated that the whole supply from these sources will be upwards of 900,000 gallons a day, or more than double that given by the two principal aqueducts upon which the cities before chiefly depended. For the purpose of boring through the rock, and exploring laterally from the sides of the shafts, a boring apparatus, which will cost £240, has been ordered from England.

STAINED GLASS.

Four stained-glass windows have been placed in the restored church of Scarrington-with-Aslockton by Messrs. Ward and Hughes, two in the chancel, representing the Ascension, and the other two the Annunciation, the Adoration, and the Circumcision.

During the Christmas week two windows in the parish church of Hawley, Hants, have been filled in with stained glass by Messrs. Ward and Hughes. The east window represents the Nativity, Crucifixion, and Resurreetion of the Saviour, and the north window St. John writing in the island of Patmos.

TO CORRESPONDENTS.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

Correspondence.

STEETLY CHURCH.

To the Editor of the BUILDING NEWS.

SIR,—Observing in your impression of January 3rd, that you have lithographed another of the photographs from my published work on "The Architecture and Sculptured Details of Steetly Church," I thought that a few notes respecting that building might probably be acceptable to your readers, it being an extremely good example of a small Norman *church* (not "abbey"), and is rendered additionally interesting from the fact that it has almost entirely escaped alterations in succeeding periods. It is situated on the northern extremity of Derbyshire, and in close proximity

with the boundaries of Yorkshire and Nottinghamshire; but, owing to its secluded position, is comparatively unknown. The assumed date of the building is A.D. 1120, or somewhat later, and consists of a nave and chancel, 56ft. long, divided from each other by a massive arch, lately illustrated in the BUILDING NEWS. The latter terminates in a semicircular apse, separated from the remainder of the chancel by a second arch lower than the first, and also by the elevation of its floor, and which is lighted by three semicircular headed windows. It has long been unroofed; but probably once presented an appearance very similar to the little church of Dalmeny, in Linlithgowshire, the plan of which it greatly resembles. It may also be compared with that of Kilpeck, in Herefordshire.

The details of the door which you illustrated last week are exceedingly interesting. The outer arch, ornamented by the chevron moulding, rests upon two semi-detached shafts, composed of six stones each, on which are carved the twelve signs of the zodiac.

It also affords an example of the curious mermaid capital, seldom found in England, but sometimes to be met with (I believe) in the south of France. The shafts of the second arch are detached and formed of elaborate interlaced ornament, far superior in design to the celebrated pillar in Shobden church; indeed, it would be difficult to find a sample of Norman detail in which is displayed so much artistic treatment as there is in the careful arrangement of the ornamentation of the pillar on the left side of this doorway

The church, though small, is rich in carving, the most interesting being a double capital, representing the conflict of St. George and the Dragon, which is treated with considerable skill. The capitals in the interior of the apse are all good in design, the most curious being one representing the temptation of Adam and Eve, given in your issue of March 2, 1866. There are several traces of polychrome work to be found in the apse, the prevailing colours being red and blue. The enriched string which surrounds the apse externally is in remarkably good preservation, considering that the stone employed was the soft limestone still obtainable hard by. It is much to be regretted that this church has suffered damage by wanton mutilations. In the apse the corners and base mouldings of the pillars have been ruthlessly knocked off, and the reason assigned for this act of Vandalism is that, previous to the building passing into the hands of its present noble owner (the Duke of Newcastle), a man who formerly rented the adjoining farm used the church as a sheepfold, and cut off all angles and projections, to prevent the animals from injuring themselves. I regret to add that the inner keystone of the door that you have illustrated has been removed by the man working the adjacent quarry, who carried it off as a trophy of the durability of the stone he had to vend, and of which this interesting building is constructed.—I am, &c., THEOPHILUS SMITH.

Sheffield, January 6.

[We engraved the illustrations from a photograph which was provided us. We were not aware that Mr. Smith had published a work on the subject.]

DURHAM UNION WORKHOUSE COMPETITION.

SIR,—Being a subscriber to your journal, I take the liberty of asking your advice in reference to the following competition:—I, along with other architects, sent in designs for proposed additions and alterations to the Durham Union Workhouse. The competition was public, and the guardians provided a code of instructions for the guidance of competitors. They appointed a special committee to enquire into, and report upon, the several designs, and they recommended my design for the first premium. The committee consisted of ten members of the board, and there were only two who dissented from the recommendation of the committee. I leave you to form your own opinion of their motives in dissenting from the committee's recommendation (see report enclosed).

The land objected to by one of the committee was the result of straightening the present crooked fence, and when I made the proposal in the design to straighten the boundary, it was with the intention of improving the site, more than for any improvement it made in the design, there being nothing mentioned in the instructions to architects that the boundary had not to be exceeded, in fact, the ground to be worked on is not mentioned in any way whatever, and no plan of the site was supplied. I was not aware, till I saw the report that the adjoining ground was not property belonging to the workhouse.

Now, Sir, do you think it would be fair to throw my plans out for the reason stated above, that being the only objection one of the committee have to the design, it being so arranged that there would not be required the slightest alteration in any of the buildings, and if carried out on the ground belonging to the workhouse, the only difference would be that it would make the mews yard a little smaller, and still leave a yard of sufficient size for their requirements. Your advice upon the above, in your next impression, would greatly oblige.—I am, &c., COMPETITOR.

[In looking over the report, we can come to no other conclusion than that the committee decided on having a competition without maturely considering the matter. That is a misfortune for "Competitor," and particularly as there was no pledge given that any design should be carried out.]

CORPORATION BUILDING REGULATIONS.

SIR,—It is stated in your paper of the 4th inst. that the Liverpool Corporation have been obliged to abandon the best plan (an admirable one) for workmen's dwellings (to be built by the Corporation itself), because it cannot be reconciled with their own bye-laws. I hope this case will draw the attention of the profession to the often despotic and tyrannical nature of such bye-laws, not only in Liverpool but in other towns. These laws often manifest little practical acquaintance with buildings, and surveyors and local boards of health, who, one might suppose, would consider each plan on its merits, too often avail themselves of the letter of the law to oppose the projects of individuals who may be personally distasteful to them. Clauses more or less objectionable creep into these bye-laws at every new edition—the boards of health are even constituted arbiters of taste as well as in the matters of health. If time permitted, I could give instances of this nature, but many of your professional readers will be able to call to mind cases which bear out this statement. Can anything be done to counteract this evil, which is a growing one?

A PROVINCIAL ARCHITECT.

Intercommunication.

QUESTIONS.

[710.]—ZINCING OF IRON.—I am anxious to zinc some iron, but am in doubt as to what strength the solution ought to be. If some of your readers will describe the process it will oblige.—DONCASTER.

[Iron may be conveniently coated, in the humid way, by a solution of sulphate of zinc, or one of the double salts of chloride of zinc and sal-ammoniac, as now used in soldering, and welding, to secure success. The zinc solution should be weak, and only a weak galvanic current should be used, otherwise the zinc precipitated will again separate from the iron in scales. With proper precautions the deposit may be made as thick as strong paper. The article must be well cleansed before undergoing the operation.]

REPLIES.

[688.]—FLOW OF WATER IN PIPES.—I propose to answer the question of "Inquirer" by using the following general formulæ for the quantity of water discharged by a circular pipe running full, when the gradient and diameter of pipe are known. The proof of the formulæ is long, but if required it will be given on another occasion:—

Let Q = quantity of water in cubic feet discharged per minute by any pipe.

$\frac{h}{l}$ = gradient or ratio of height to length in feet.

D = diameter of pipe in feet.

Then $Q = 2356 \sqrt{\frac{h}{l}} \times D^5$

In this case $h = 9{\cdot}5$ feet; $l = 5280$; $D = \frac{18}{12}$ feet.

$$\therefore \quad Q = 2356 \sqrt{\frac{9{\cdot}5}{5280}} \times \left(\frac{18}{12}\right)^5$$

Using logarithms as best adapted to this calculation—

Log. Q = log. 2356 + ½ log. 9·5 + $\frac{5}{2}$ log. 18 − (½ log. 5280 + ½ log. 12)

log. 2356 = 3·37218
½ log. 9·5 = 0·48886
$\frac{5}{2}$ log. 18 = 3·13817
0·99921
6·99921
4·55926
2·43995 = log. Q.
½ log. 5280 = 1·86131
$\frac{5}{2}$ log. 12 = 2·69795
4·55926 ∴ Q = 275·4 cubic feet.

Answer—Q, or quantity discharged per minute = 275·4 ubic feet, or 1721¼ gallons.—L. A. B.

[702.]—GREENHOUSES.—Hot water is the most satisfactory and economical way of heating a greenhouse, small or large. Bottom ventilation is obtained by small sliding ventilators built in the wall at convenient distances from each other, say four in a 20ft. house; and also by the upright sashes (if any) having on the top, to open outwards, top ventilation, by means of small wooden sashes, also being on the top at convenient distances apart, or (which is more satisfactory) by raising the top square, the whole length of roof, 5in. above and overlapping the under 4in. to prevent the rain driving in, and small trap doors inside to open or shut at pleasure.

The above top ventilation refers to a roof composed of rafters not made with long sashes.—J. G. G.

Suggestions.

The process of galvanizing iron, as practised in one of the leading establishments of Philadelphia, is as follows:—Selected sheets of iron, after being trimmed to requisite size and cleaned by a weak solution, are rolled smooth, then dried in an oven, and each sheet placed in contact with zinc. Both metals are raised to an equal heat, and thus fusion is effected. The regulation of the heat necessary to metallic combination is a point of nicety and care.

Although chimneys are essential to argand gas burners and globes, also in many places where fish-tail burners are used, and the ornamental effect is pleasant, still they are detrimental to the diffusion of the light of gas. A clean glass globe obstructs about 12 per cent.; a clean globe engraved with flowers about 24 per cent.; a globe ground all over 40 per cent.; an opal globe 60 per cent. Hence is apparent the folly of using elaborately engraved and ground globes or shades where it is desirable to economise. If engraved at all, the upper portion should be embellished, while the lower part should be left clear for the free passage of light.

STATUES, MEMORIALS, ETC.

The Committee of the O'Connell National Monument have unanimously adopted Mr. Foley's model. £10,000 is already subscribed towards the cost of erection of the work, which will be in bronze and granite, and 40ft. high.

The Scotch artist, Alexander Monro, has just completed a marble bust of the late Monsieur Cousin, which, by order of the French Government, is placed in the Palais de L'Institut. It is pronounced to be a fine work of art and an excellent likeness.

It is in contemplation to erect a splendid fountain in Glasgow commemorative of the projection and completion of the Loch-Katrine water scheme. At the meeting of the Commissioners on Monday the Committee appointed to report recommended St. Enoch-square as the most appropriate site.

The operation of casting the Palmerston statue for Romsey was performed the other day by Messrs. Prince and Co., of Southwark. It is in bronze, is 8ft. 6in. in height, and will be placed upon a granite pilaster, about 8ft. high. Those friends and parliamentary admirers of the deceased statesman who saw the model in Mr. Noble's studio admit the likeness to be admirable.

LEGAL INTELLIGENCE.

IMPORTANT TO SPECULATIVE BUILDERS.—Joseph Neale, Benjamin Cooper, and Neale Saunders, all builders and contractors at South Norwood and Croydon, were indicted on Friday last at the Surrey quarter sessions, for maliciously damaging property to the injury of Mr. John Jones to the amount of £200. Mr. Sleigh, in opening the case, said the defendants had committed an offence of vast importance to owners of land and the public generally. It appeared that Mr. Jones, a retired tradesman, had purchased some land at South Norwood, and that in July or August last the defendant Neale took a plot of land from him for 72 years, called the "Drive," for the purpose of building thereon. Saunders and Cooper also leased plots for similar purposes. Mr. Jones agreed to advance them money at certain times to assist them, and had advanced Neale certain sums on account of dwelling-houses he was erecting, but for some reason refused to advance any more. Neale then threatened that, if he did not advance more money, he would pull the buildings down, and on the morning of November 18 he, with the other two defendants, carried out that threat, and left the buildings a mass of ruins. They threatened to serve some other buildings the same, but were taken into custody. Dr. Kenealy, on behalf of Neale, contended that it was a most unjust and spiteful prosecution. The prosecutor, by his own showing, had agreed to advance three-fourths of the money on the buildings proceeded with, and had only advanced £125, when he should have advanced £175 10s. He had also written a letter complaining of there being no basements, and requiring them to be added. This letter, until shown his own handwriting, Mr. Jones had denied sending. The chairman summed up the evidence which was called by the prosecution, and, after retiring for an hour and a-half, the jury acquitted the defendants on all the counts.

Our Office Table.

The following gentlemen have recently been elected members of the Architectural Association:—Mr. S. Wall, Duke-street, Adelphi; Mr. C. E. Burt; Mr. F. W. Gritten, St. George's-road; Mr. A. Lockwood, Tooting; Mr. R. Raikes, Gloucester-street, Pimlico; Mr. T. W. Cutler, Winchester-street, Pimlico; Mr. E. E. Smith, Parliament-street; Mr. W. Oakley, Charles-street, St. James's; Mr. F. Miller, Engineer's Office, London and North-Western Railway, Euston Station; Mr. E. G. G. Lowe, Marylebone-street; Mr. R. E. Howard, Clapham-Park-road; and Mr. R. E. Smales, Denbigh-street, Pimlico.

Dr. Chadwick, formerly of Bolton, intends to offer the sum of £10,000, to be applied to the erection in that town of working men's model cottages, the rentals from which are to be devoted to the maintenance of an orphanage which he proposes to erect. In the first instance, the orphanage will be for the admission of girls, but it will ultimately be extended so as to receive boys; and to carry out this benevolent design a sum of about £17,000 will be necessary.

There is a story going the round, on the authority of the "Court Journal," to the effect that, during the recent restoration of a church in Brighton occupied by the advanced Ritualists, one of the workmen employed, ascending the pulpit, exclaimed "I publish the banns of matrimony between this church and the Church of Rome." "And I," said another artizan, turning towards the first speaker, "forbid the banns." "On what grounds?" ioquired he of the pulpit. "'Cos the parties is too near akin," was the reply.

A French chemist recommends the use of an essence of petroleum for cleaning type, which appears to be a decided improvement on the usual practice. A French printer, after eighteen months' experience, reports that, the petroleum volatizing rapidly, does not gum up the type, in fact, leaves nothing on the face of the metal but a little white powder, which is easily removed by means of a soft brush; that it does not injure blocks; has no effect in opening the pores of the wood, but, on the contrary, hardens the surface, renders the face of the wood peculiarly smooth, and consequently increases the fineness of the work produced; lastly, the cost of the petroleum is less than half that of turpentine, and the rapidity with which it dries allows the formes to be washed without removing them from the press or machine.

Great dissatisfaction is expressed in military engineering circles at the report that the Directorship of Works, and Chief Inspectorship of Engineers, is to be conferred on General Frome, of whose qualifications and merits nothing can be said, for the simple reason that they are quite unknown. After the long series of blunders in military architecture, and the waste of public money at Portsdown and elsewhere in recent years, it was universally hoped that, whenever any change took place, some man of acknowledged ability, and possessed of the highest scientific skill, would be selected to retrieve past blunders, and now we have General Frome chosen by the authorities, because he is a "safe" man, and unlikely to prove a nuisance to an official and unreformed Horse-Guards.

A French paper, speaking of the works executed at Metz by the military engineers, remarks that the fortress is excessively strong, and that more than 100,000 men would be required to lay siege to it. At the present moment more than fifty powder magazines are situated on the whole line of fortifications, and casemated so as to be bomb-proof. All the ramparts have been heightened according to the necessities of the defence. Rumours of war urged on the completion of these works, which are being carried on under the direction of Colonel de Riviere.

Mr. George Smith, surveyor of the borough of Hanley, died suddenly last week while inspecting some street works. The bursting of a blood-vessel was the cause of death.

The guardians of Nottingham are likely to find themselves in a dilemma. They have incurred £973 expenditure in works for which they had not previously received the authorization of the Poor-Law Board, and they now find that the board refuse to sanction the payment. This may serve as a hint to guardians elsewhere to look before they leap.

Building operations in Paris are completely suspended by the frost. The Seine is completely frozen over, and can be crossed without going over the bridges. At Lyons, notwithstanding its more southern latitude, the cold last week was two degrees greater than in the French capital. Navigation is entirely impeded in the "rapid" Rhone, and the Saone is quite frozen over.

A "Poor Clerk" writes to ask if, while so much is being done for the manual working classes in the erection of model lodging houses, cheap cottages, and similar buildings, whether something cannot be done for the working classes immediately above them, consisting of men with incomes varying from £150 to £400 per annum. Suburban villas come in for a large share of abuse from their occupants and Mr. Ruskin, but no practical architect or builder comes forward to take advantage of the opportunity of erecting houses for the class most interested in them. Most men are anxious to possess a house, and many join the numerous existing building societies with that object in view. But, in the majority of cases, what sort of a house do they obtain? a shapeless mass of brick and mortar, with its imperfections concealed beneath a coating of stucco. £300 ought to cover the cost of building a semi-detached brick residence, with three bedrooms, two living rooms, a kitchen, two waterclosets, closet, &c. The Society of Arts might take this matter up, and do for the clerk what they have done for the "working man." Designs and estimates should be invited, and a prize awarded to the best; the cost of the prize could be defrayed by lithographing the prize designs and selling copies of them at a small profit.

"We are poor frozen out labouring men, and we've got no work to do." It is to be hoped that this cry, which may now be heard in any of our streets and squares, will not fail to convey a significant hint to certain vestry boards, who rather bungled matters this time last year. We may remind local boards that already a considerable quantity of snow lies on the streets, with more to come, that there is a large quantity of unemployed labour at hand, and that it will be much more easy, economical, and convenient to keep the thoroughfares clear now than it will be after an accumulation of fresh storms of snow. We do not want to see the streets all but impassable, as too many of them were last winter. A spade in time will save nine.

Mr. Holmes, F. S. A., of the manuscript department of the British Museum, has left London, to join the Abyssinian expedition as archæologist on account of the museum. Mr. Emanuel Deutsch, who had been selected by the trustees for the service, it is understood declined the mission.

The importation of timber for the last year shows a considerable decrease on that of its immediate predecessors. In 1865 and 1866 we were overtrading in wood to a large extent. The supply for the seven years preceding 1860 had given an annual average of about 2½ millions of loads. For the three following years it became 3 millions, and in 1863 and 1864 it rose to 3½ millions, and then the greater imports of 3¾ millions in 1865 and 1866 left a large unconsumed surplus. Yet, although the importation of little more than 3,000,000 loads in 1867 takes us back five or six years for a parallel quantity, it has supplied all demands, besides leaving a very considerable surplus.

The First Commissioner of Her Majesty's Works, &c., has, it is said, decided on increasing the bathing lake in Victoria Park to nearly double its present size. The works will be commenced immediately, and, following the best precedents of the public works carried on in Lancashire during the cotton distress, will be done by task work. In this way employment will be given to many in the East of London, willing, but at this time unable, to find work.

The little fishing village of Schwarzort, situated on the shore of the Baltic, between Memel and Dantzic, has, within the last three years, acquired a certain importance, owing to the discovery of a large bed of amber. The amber is found almost uniformly in separate nodules, with lignite disseminated in the sands at a depth of from 10 to 12ft. The dredging is carried on day and night, by shifts of eight hours each. About 400 persons are employed at this work, and their wages are on the average 22 silver groschen (2s. 2d.) per shift. The quantity of amber collected is considerable, amounting to about 288 lbs. per shift, and for six days' work 5,184lbs.

One of the churchwardens at Preston has been creating quite a sensation by his energetic opposition to the Ritualistic movement. It appears that, for the recent festive season, St. Peter's church was decorated, and, in addition to the evergreens, &c., seven crosses were put up, four at the altar, two near the reading-desk, and a very large one in front of the organ. These "Popish Emblems," as he regarded them, gave great offence to the churchwarden aforesaid. He sought out the incumbent and the curate, before whom he laid his grievance, and, after much parley, the incumbent offered to cover up some of the crosses, by way of compromise. This offer did not satisfy the orthodox warden, who (having some time previously got possession of the keys, which he was accused by the incumbent of having stolen) proceeded to the church and hauled down the crosses. He coloured the four at the altar with ultramarine blue (previously they were gilded, with a blue base), and finally deposited the emblems at one of the doors of the church. And so ends, for the present, this indignant crusade against crosses. It is expected, however, that the matter will not be allowed to rest here.

"Hints on Household Taste," in reference to the design of furniture, &c., &c., by Charles L. Eastlake, architect, will shortly be published by Messrs. Longman.

MEETINGS FOR THE WEEK.

TUES.—Institute of Civil Engineers, inaugural address of Mr. C. H. Gregory, president, and time permitting, renewed discussion upon the papers on the "Victoria Bridge," and on "New railways at Battersea, &c." 8.

THURS.—Inventors' Institute—"On Promoting the Improvements of our Arts and Manufactures by Reviving the Action of Trade Guilds," by F. W. Camper, Esq. 7·30.

SAT.—Associated Arts Institute—"On Education and Art," paper by L. H. Michael, Esq.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

1418. M. D. ROGERS AND J. WILSON. AN IMPROVED FIRE ESCAPE. Dated May 13, 1867.

This invention consists in constructing a fire-escape in the following manner, that is to say:—To the upper windows, by preference, and to the brickwork at each side thereof, and outside of the building, the inventors hinge a bar or "davit" by its lower end, and to the upper end of each bar or davit aforesaid they connect one end of a chain or fireproof rope, the other end whereof is connected to a counterbalance weight sufficiently heavy to balance a cage or balcony slung by its ends, or suspended from the upper ends of the aforesaid bars or davits. They propose to pass a tube or tubes through the several floors of a house or other building, and allow the counterbalance weights before mentioned to pass freely up and down the said tubes, so that, supposing the fire-escape to be in use, and persons to have entered the cage or balcony, they can lower themselves down by means of a chain, or other suitable contrivance, and when they get out, the cage or balcony will be lifted up by the counterbalance weights before mentioned, thus rendering the fire-escape self-acting. The tubes containing the counterbalance weights the inventors propose to connect by their lower ends with a water main, fitted with cocks for establishing a communication with the main, when it is required to use the aforesaid tubes for extinguishing fire in a house or other building, and they perforate the said tubes for the escape of water into the rooms of a house, the said perforations being made near the ceiling by preference; by these means a large body of water may be discharged inside a house. The aforesaid tubes when not charged with water serve to carry off the vitiated air from rooms, the air entering the tubes by the perforations therein, and passing off through the upper ends thereof into the open air.—Patent abandoned.

1426. J. G. JENNINGS. IMPROVEMENTS IN WATER-CLOSETS AND SINKS. Dated May 14, 1867.

According to this invention the patentee arranges water-closets in such manner that, whilst the excrementitious matters which the basin may receive, together with the small quantity of water which the basin holds, are discharged into a receiver, so as to be applicable for use as a manure; the comparatively large quantities of water which are used to scour the basin are kept out of this receiver, and directed away into a sewer or otherwise, as may be desired, but without mixing with and diluting the excrementitious matter, which is consequently discharged almost in an undiluted state into the receiver, whatever be the quantity of water used to cleanse the pan. For this purpose the patentee employs a pan with a valve at the bottom, and when this valve is opened the matters in the pan press into the manure receiver. The same act of opening the valve of the pan also in the usual way open a valve for the supply of the scouring water, and the water supply valve is so arranged, as is well understood, as to remain open for a regulated time. The scouring water is, however, prevented from passing into the receiver as long as the valve of the pan is closed; the scouring water is admitted and the excess passes away by a side opening from the pan, leaving therein only a small quantity of water, say a depth of half an inch, but more or less as may be desired, and sufficient to prevent the adhesion of the soil.—Patent completed.

Trade News.

TENDERS.

ALFRETON.—In last week's BUILDING NEWS Johnson and Wright's tender was stated to be £1,344. It should have been £2,344.

LONDON.—For offices and stabling, Grosvenor-road, Pimlico, for Mr. D Radford. Mr. W. G. Wallis, architect. Quantities supplied:—

Copp and Son	£1,320
Charles Fish	1,195
James West	1,169
Adamson and Sons	1,122
Hoare and Postlethwaite	1,057
Wm. Beeton	1,050
A. Ager	995

MAIDENHEAD (BERKS).—For villa residence, Birchett's-green, near Maidenhead, Berks, for Mr. A. Lawrence, Great Marlow. Mr. Charles Carter, architect:—

Silver	£1,990 0
Revel	1,959 0
Woodbridge	1,924 10
Matthews	1,777 0
Simmonds	1,687 0
Allaway	1,650 0
Corby	1,[illegible] 0
Smith	1,[illegible] 0

WESTBOURNE PARK.—For constructing sewers and temporary roadways on an estate near Westbourne Park, for the Land and House Investment Society (Limited). Mr. Josiah Houle, surveyor:—

Lacy and Freeman	£3,700 0
R. Hubbard	3,486 0
T. Emor	3,284 0
Adamson and Taylor	3,125 0
W. T. Williamson	2,944 15
R. Moxon	2,930 0
H. Potter	2,885 0
J. Bloomfield	2,867 0
G. George	2,842 18
W. H. Goodlar	2,817 0
J. H. Turner	2,800 0
J. Porter	2,220 0
P. Porter	2,250 0
T. Floyd	1,902 0

BATH STONE OF BEST QUALITY.

RANDELL and SAUNDERS, Quarrymen and Stone Merchants, Bath. List of Prices at the Quarries and Depots; also Cost for Transit to any part of the United Kingdom, furnished on application to Bath Stone Office, Corsham, Wilts.—[ADVT.]

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Joseph Henry Lack, Battersea, house decorator, January 23, at 2—William Udy Willcock, Dalston, builder, January 23, at 1—Thomas Lucas, Barnes, builder, January 23, at 1.

TO SURRENDER IN THE COUNTRY.

Gregory Cope, Oldhill, near Dudley, builder, January 15, at 12—Edward Cribb, jun., Neath, builder, January 15, at 11—Henry Evans, Everton, near Liverpool, painter, January 15, at 3—William Matthews, Smethwick, plumber, January 15, at 11—William Verrier, Bishop's Lydiard, Somersetshire, carpenter, January 18, at 11—John Calverley, Woodhouse, near Leeds, stonemason, January 20, at 12—James Edmonds, Worcester, builder, January 22, at 11—Thomas Johnson, Towcester, bricklayer, February 3, at 10—Robert McLean, Manchester, builder, January 24, at 12—Richard Piper, Brighton, builder, January 13, at 11.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

February 11, R. R. Bishop, Norfolk-villas, Broadway, South Hackney, builder—February 18, J. Dines, Forest hill, builder—Jan. 24, J. Meredith, Fres cign, lime dealer—January 24, W. Bulcock, Everton, builder—January 23, J. Jennings, Ventnor, painter January 21, I. Jones, Talywain, mason—January 20, C. Trail, Shrewsbury, civil engineer—January 28, W. Dalby, Atwick in Holderness, joiner—January 1, W. Roberts, Portmadoc, painter—January 15, T. Williams, Festiniog, engineer—January 16, G. Hitchcock, Ilkeston, stonemason January 16, R. J. Barnes, Denbigh, mining engineer—January 29, L. Robinson, Darlington, joiner—January 24, R. Coppen, Grimstone, Norfolk, carpenter—February 11, G. Stinchcomb, Usk, carpenter—February 6, R. Burgess, Rottingdean, near Brighton, bricklayer.

PARTNERSHIPS DISSOLVED.

Brown and Bourne, Liverpool, decorators and painters—Moon and Son, Guildford, builders—The Birmingham Cut Nail Company—Jameson and Co., Newcastle upon-Tyne, engineers—Bell and Davison, Sunderland, joiners—J. and J. A. Hayes, Bristol, carpenters—Palliser and Son, Northallerton, brickmakers—Dillon and Quick, Southsea, builders—G. and J. Curtis, Poole, builders—Davison and Pawson, Jarrow, brickmakers.

BANKRUPTCY ANNULLED.

Charles Nichols, West green, builder, Dec. 31

DIVIDENDS.

January 22, W. Tadgell, Balham, builder—January 20, W. H. Hartley, Leeds, timber merchant.

DECLARATION OF DIVIDEND.

J. P. Baragwanath, Upper Thames street, engineer, div 2s. 5d.

THE BUILDING NEWS.

LONDON, FRIDAY, JANUARY 17, 1868.

WHAT THE FRENCH CAN TEACH US.

THE Paris Exhibition of last year has engraven one idea deeply in the minds of Englishmen, and that is that we have much to learn from our neighbours. Nations, like men, differ from each other. Every nation possesses some distinctive quality, is characterized by some distinctive institutions or habits, and is, therefore, enabled to teach all other nations a lesson. These national differences arise from origin, climate, geographical position, history, and education. The English have certain qualities which it would be well for all other nations to imitate. The same may be said of the French, the Italians, the Germans, and the Russians. What immediately concerns us is wherein and in what degree can the French teach us. It appears to be the almost universal impression of those who visited the late Exhibition that they can teach us a great deal. Many have gone so far as to say that England is already beaten in the national race, and that the climax of our prosperity has passed. Not so, however, think a majority of those skilled artizans whose volume of reports we noticed last week. We promised to recur to its pages, in order to glean therefrom a few suggestions for our future guidance. The book is, in fact, full of suggestive information. Almost every writer speaks of our comparative backwardness in matters of taste, and they almost all agree in giving France in such matters the foremost place. Mr. Thomas Connolly, stonemason, says, "It is impossible to estimate the loss which is entailed in England through the neglect of art-culture in every department of our industry." "The foundation of French excellence," says Mr. James Plampin, "is education. Their superiority is in taste, and taste is essentially a matter of education. Owing to the extent of this kind of education, the taste of the whole nation is higher than that of the English." Mr. F. J. Jackson, of Birmingham, says, "One noticeable feature in French industry is the universal application of art, no object being too mean for adornment, and every article capable of being turned into a thing of beauty, receives its share of attention at the hands of the artist." The same writer, when speaking of the Americans, says: "While other exhibits rest principally upon rare and costly works, elaborated to the highest degree, the little display of the Americans rests upon humble works, proving that ordinary articles may be exalted and invested with a dignity that will entitle them to rank with the proudest achievements of industrial art." Our attention, however, is not now devoted to the Americans, but to the French. If they are so superior to us in matters of taste, there must be some cause for it. Now, what is that cause? Some people have sought for it in the incapacity of the English, or rather in the superior aptitude of the French. French ladies say that English ladies are all left-handed, or they work as if they were. There is no doubt that, if an ordinary French woman were to simply hang a curtain, she would do it much better than an ordinary English woman. Still, we will not for a moment admit that the natural capabilities of the French are superior to those of the English. We agree with Mr. Jackson, the gentleman last quoted, who says, "The contrast presented is the result of difference of aim, and not of the want of capacity. While we have devoted ourselves to the perfecting of material processes of manufacture, and the substantial character of our utilities, the French have brought their energies to bear on decoration." And they have made this a part and parcel of their educational system. They have regarded it as a national necessity and acted accordingly. "While, perhaps," says Mr. Plampin, "there are scarcely more than four out of two hundred English jewellers who can draw, from inquiries made there are scarcely four out of two hundred in France who cannot. Nor is this surprising, when we learn that drawing is regarded and taught more as an essential than an accomplishment. As children they are taught at their day-school, and that not occasionally, but as part of the usual routine." With regard to the great question of general education, it may be said that we are not far off from its solution. We have been talking about education for many years, and there have not been wanting eminent leaders in the House of Commons who have regarded it as a necessity and a right; but the jog-trot instincts of that House, constituted as heretofore, have defeated almost all attempts at useful legislation on the subject. Now, the prospect brightens. It is not only heard, but almost felt, in every direction, that one of the first things the reformed Parliament will address itself to is the universal, and, if necessary, the compulsory, education of the people. Whatever else an extended suffrage may have in store for us, it is certain that the great cause of education will not suffer thereby. There can be little doubt that this nation is on the eve of great, if not beneficent, changes. In the course of a short time energies will be loosened which have hitherto been fettered, and forces will operate which have hitherto been inactive. We, however, do not fear the result. The educated nation must be stronger and more productive than the ignorant nation. France, however, is not so much in advance of us in general educational matters as Germany, Belgium, and Switzerland; and has, therefore, not so much to teach us on this question as on the cultivation of taste. The two things must, however, go hand in hand. Whilst insisting that every English child shall be educated, facilities for fostering a love of the beautiful may be multiplied. In fact, the words "technical education" are now on almost every one's lips, and in this work we have much to learn from the French. They possess many more schools of practical art than we do, and the system of drawing in those schools is different to that pursued in this country. Mr. F. J. Jackson says, "There seems to be no over-anxiety for fineness of outline, while in shading the readiest method is generally adopted, more importance being attached to the realization of form, and less to mere manipulation. Great stress seems to be laid upon drawing from the human figure and from natural flowers." Mr. Jackson thinks we begin at the wrong end, as fineness and neatness of line are the results of much practice, and in early training are of much less importance than the acquisition of correct notions of size, proportion, and forms. In this country too much of the student's time is spent in making copies from the "flat," instead of drawing from objects. "Art education," says Mr. W. G. Deeley, "is carried on in France quite on a different plan to what it is in this country. Youths at an early age are not kept at outlining for a couple of years; but the instant they can do a little drawing they commence shading, which is not half so sickening to the young minds, and at the same time more gratifying." Mr. Andrew Stevenson, of the Leeds School of Art, amplified this point in an article which appeared in the BUILDING NEWS, No. 673. So, also, did Mr. John S. Rawle, in his suggestive article on the French and English Systems of Art Education, in the BUILDING NEWS, No. 672. There appears to be a general concurrence of testimony that our method of art education is essentially defective, particularly on two points—first, in not drawing from the human figure, natural objects, antique works, machinery, &c.; and, secondly, in aiming at mechanical accuracy and finish, instead of encouraging a bolder and more general study of light, shade, and form.

One of the chief things spoken of in these "Artizans' Reports" is the superiority of Paris to London. Mr. Thomas C. Barnes says "the daily life of the Frenchman is surrounded with associations of beauty, hence his superiority in design. All that the Englishman can do with the means at his disposal he has done—that is, the workmanship is superior, but he lacks the education and knowledge of classic art which the Frenchman possesses. This, in my opinion, is at the root of all the differences which exist between the glass trade of England and that of France and the Continent generally." That London will ever be as beautiful as Paris cannot be expected; but that it may be improved and is improving must be admitted. Though we cannot control the sun, the wind, and the clouds, we can multiply museums of art, and facilities for art education equal to what they have in France. What we want is not one great museum, like that at Kensington, which is so far away from the mass of Londoners, and which absorbs so much money, but museums within easy reach of our great industrial populations. Every great city should have its art museum, and then arises the question whether these museums should be opened on Sundays. Most of the writers of these reports think that they should, and give excellent reasons for their opinions. Possibly this question will also assume a bolder aspect in future Parliaments. There are many other things which we can learn from Frenchmen in relation to trade matters, trade unions, strikes, courts of conciliation, dining halls, sobriety, politeness, good feeling between employers, the apprenticeship system, hours of labour, wages, &c., which we will glance at on a future occasion.

LONDON ORPHAN ASYLUM COMPETITION.

ONCE more the competitive system presents itself to us in a disagreeable light. If fairly and honestly conducted, competitions are calculated to improve architecture, promote merit, and benefit the public; if dishonestly conducted, they must have a contrary influence and tendency. Plato said that a republic would be the best form of government, provided every citizen were a philosopher; and we say competitions would entail incalculable benefits, provided they were justly conducted. But, as justice is the exception, instead of being the rule, in their conduct, we are surprised that respectable architects enter on them so frequently. Let us take a case in illustration. The board of management of the London Orphan Asylum lately invited a limited number of architects, whom they thought most likely to carry out such a work, to enter into competition for a new asylum about to be erected for charitable purposes near Watford. The gentlemen invited were Mr. Fred. Peck, Mr. Dawson, Mr. Robins, Mr. Watson, and others. A printed set of instructions was handed to each of the competing architects; one of these instructions stated that the building, exclusive of fittings, should not exceed £65,000. In due time each of the competitors received a letter from the secretary stating that the board of managers had awarded the premiums in the following order:—1. Mr. Dawson, 2. Mr. Robins, 3. Mr. Webster. On inquiry being made to the secretary as to the amounts of the estimates given by the three architects to whom the premiums were awarded, it was stated that Mr. Dawson's estimate was £78,500, subject to a reduction of £10,000, should the infirmary and other arrangements be reduced to the stipulated provision; Mr. Robins's estimate was £71,500; and Mr. Watson's estimate was £66,587. Now it will be observed, that each estimate was beyond the sum specified in the instruc-

tions. It so happened, however, that the estimated cost of the design submitted by Mr. Fred. Peck was only £55,000. Now assuming that Mr. Peck's estimate was a correct one, we have no hesitation in saying that the board of management of the London Orphan Asylum are not the most economical and trustful persons to dispose of funds subscribed for charitable purposes. We make this charge advisedly and deliberately. Now we have every reason to believe that Mr. Peck's estimate was a correct one. Instead of being over the sum stipulated in the instructions, it was very much under; and Mr. Peck has given many instances of his ability to erect such works within the estimated cost. Let it not be supposed for a moment that we care anything about Mr. Peck personally. We would as soon that Mr. Dawson was the selected architect as Mr. Peck, or Mr. Watson as Mr. Dawson. We entertain no feeling of partiality in the matter, as we only look at it from a public point of view. And we ask what right has this board of guardians to select a design which shall cost £78,500, or even £10,000 less under certain conditions, when another competent competitor undertakes to do it for £55,000? Is it not, to say the least of it, an unnecessary expenditure of charitable funds? Is it not a misdirection of benevolent intentions? But why, it may be asked, could the board have so acted? We know no other reason than that Mr. Dawson is architect to the board; or so we have been informed. Here, then, is a question in which the subscribers should raise a voice, and in which the public are deeply interested. It is a question not only affecting the competitive system and the interests of architecture, but the tone of public morality, and the economic appropriation of money collected for sacred purposes. It is a question which demands further investigation.

In awarding premiums to architects who exceeded in their estimates the limits specified in the printed instructions, the board broke faith with the competing architects who obeyed these instructions. This is of vital importance, and we are not sure whether the board, in so acting, have not subjected themselves to an action for damages on the part of the architects who complied with the conditions. These architects, in obedience to an invitation, put themselves to considerable cost and labour, and they, by-and-bye, find that they are, as it were, punished for their fidelity. Whatever may be the legal bearing of the question, we feel no hesitation in saying that the architects who complied with the instructions are morally entitled to reasonable pay for the labour they were put to. We, however, call attention to this subject, not for the benefit of any single individual, but for the public considerations it involves, and with the hope that it may prevent injustice in future.

THE LIFE AND WORKS OF SIR CHARLES BARRY.*

SECOND NOTICE.

WHATEVER differences of opinion may exist as to the quality of some of the works executed by the late Sir Charles Barry, there can be no two opinions as to the vast amount of work he performed during his very busy life. To the list of buildings of a collegiate, ecclesiastical, and domestic character already enumerated which were either entirely built from his designs, or received reconstruction at his hands, might be added the following—In 1831 he erected a new wing to Dulwich College, and a small school, but these designs, which were of an unpretentious kind, were remodelled and expanded in carrying out the more extensive alterations of the college effected under the direction of his son, Mr. Charles Barry, in 1858. The Birmingham Grammar School has always been regarded as one of Barry's most successful Gothic works. It was begun in 1833, and completed in 1836, and it was during this period that he made the acquaintance of the elder Pugin, "whose assistance he secured in making out some of the drawings for details." In 1837 he designed a small Gothic Unitarian chapel at Manchester, of no particular merit. Two years afterwards, he added a wing to the University College, Oxford. Hurstpierpoint Church, erected in 1843, is a work of some importance, though it will not bear comparison with what has been done by many of his contemporaries, either in originality or effect. It was one of the characteristics of Sir Charles Barry, that he was apt in his designs and plans to lose sight of economy, in his love of the grand and extensive. Frequent mention is made in the Memoir of designs which had to be rejected, on account of the cost necessary to carry them into execution. In other cases—of reconstruction for example—often only a portion of his plans were carried out, for the same reason. His conceptions were on too enlarged a scale, and were too expensive to suit the means, if not the wishes, of his clients. With not a few of his private as well as his public works was this the case. It may indeed be said that comparatively few of his designs were carried out; the New Palace of Westminster itself might be cited as an instance. Among private buildings, Clumber House is a notable case in point. Of all Barry's designs for a grand private residence, this, we believe, was the largest and most comprehensive. Plans and illustrations are given in the Memoir to show the character of the design. But it will be sufficient to state, that the only part of the scheme as yet executed is the erection of the new church by the present Duke of Newcastle, in the position indicated by Sir Charles, but from the designs of Mr. Thomas C. Hine, of Nottingham. This was one of the last of Barry's efforts, the date being 1857. But, as his biographer remarks, the great majority of these unsuccessful, or at least unrealized designs, has reference to public buildings. "Of all Sir Charles Barry's works," says his son, "the one which is generally considered the least successful was the laying out of Trafalgar-square. On this subject he was consulted by Government in 1840, and his chief idea in the arrangements which he suggested was to improve the effect of the National Gallery." We have heard a great deal about what has been flatteringly called "the finest site in Europe," and there has been no end of sneers levelled at the Trafalgar-square fountains. A fountain is one of the things which they do manage better in France, and it would be idle to institute a comparison between the Grandes Eaux, of Paris, and the wretched squirts of London. We must acknowledge that they are a decided failure. It is only justice, however, to the reputation of their designer to state that his shortcomings at least admit of explanation. Sir C. Barry was thwarted in his scheme for the improvement of the square. At the time he was consulted, a plan was already under consideration which contemplated the raising the whole square to the level of the pavement in front of the new building, and finishing it with a terrace and balustrade towards Cockspur-street. To this he had a strong objection. He considered the National Gallery to be already greatly deficient in importance, and unworthy of its site. Such a terrace as was proposed, seen in the foreground on approaching from Whitehall, would throw it back into utter insignificance. He advised, therefore, that the level of the square should be kept down to that of Cockspur-street, instead of being raised to that of the base of the building, and the terrace thrown back, so as to make it appear a part of the building, thus increasing instead of diminishing its height. This plan was adopted, but greatly injured by the erection of the Nelson column, against which Mr. Barry protested in vain. Not only did it cut up the building, but it interfered with a grand flight of steps which he contemplated in the centre of his terrace, of the width of the whole portico of the Gallery, and appearing from a distance to be a part of it. Its own design would be no compensation, for to the use of columns or pedestals for statues he objected on principle. He would have had the Nelson and Wellington monuments (treated in a different style, as grand designs in sculpture) placed on either side, in the position of the present fountains. When this proved to be impossible, he introduced the fountains as a last resource. He intended them to be far larger; he wished them, indeed, to be of the scale of the grand fountains in front of St. Peter's, at Rome, but for this funds were not forthcoming, and an unexpected difficulty was found in obtaining a full supply of water. But, adds Dr. Barry, "though fully aware that they were too small, he never felt the justice of the severe criticism which has been so unsparingly lavished upon them." A chapter is devoted to the chief unexecuted designs of the architect. These embrace designs for New Law Courts, the National Gallery, the Horse Guards, the Royal Academy, the British Museum, the Crystal Palace, and the extension of the Houses of Parliament. As far back as the year 1840, he prepared, at the request of the Government, a design in the Greek style, "which he had long discarded," for the Law Courts, on the site which is now being prepared for them. He seems, however, to have had a strong leaning to the centre of Lincoln's Inn-Fields, as it "would involve no expense in the purchase of existing buildings,' and he yielded reluctantly to the outcry raised against the scheme. Another plan, submitted five years subsequently, involved the inclosure of New Palace Yard, and the extension of the palace itself. His idea, with respect to the National Gallery, was to extend it by building over the vacant space in front, and to advance the edifice to the line of the street. The elevation was to be raised, in order to overcome as much as possible what he considered the fatal effect of the Nelson column upon the façade. It is not improbable that this idea will be realized in any design that may ultimately be selected for the New Gallery. Again, as to the British Museum, it was apparent that the grand portico rendered it impossible to extend the building towards Great Russell-street, and there were difficulties in the way of its extension in other directions. He therefore proposed—and the notion has frequently been urged since—to remove the Natural History Collection elsewhere, and to devote the whole of the present building to literature and art. Certain internal alterations and re-arrangements were suggested; but Mr. Panizzi's great reading-room scheme was preferred by the Government, and here, as in other instances, Sir C. Barry's designs turned out fruitless. The necessity for the enlargement of this invaluable institution is greatly more felt now than it was ten or fifteen years ago, and by-and-bye it will be absolutely imperative for the authorities to make a decided move in the matter. If we may take the unsightly tarpauling excrescence which disfigures the front of the Museum as any evidence, the building is full to overflowing, and ready to burst its walls. We have heard it hinted that there is a considerable area of ground behind the Museum that might be utilized without much trouble. At all events, we see no reason why the two large buildings at present devoted to officers' residences should not be made available as receptacles for a portion of the overcrowded collection. These buildings, as we understand, give accommodation to about a dozen officers, and altogether to something like fifty persons, and they are kept up at very great expense. Now there is no necessity for having so large a staff lodged within the building, which is otherwise amply protected. There ought certainly to be a resident officer, with some assistance at his command in case of emergency, but at least one half of these officials might be dispensed with, so far as their

* "The Life and Works of Sir Charles Barry, R.A." By Rev. ALFRED BARRY, D.D., Principal of Cheltenham College. John Murray. 1867.

domiciliary presence within the precincts of the Museum is concerned. It would occupy more space than we have at command to describe in detail the extensive scheme which Sir Charles Barry had in contemplation for the general improvement of the metropolis, and more particularly of Westminster. Nor is it necessary that we should do so, since not a few of his suggestions have in part at least been followed, while, in other instances, improvements differing from those he had in view, but great improvements nevertheless, are in active progress at the present moment. Like Sir C. Wren, Barry's great ambition was to rebuild London after his own ideal. He formed a grand scheme of metropolitan improvements which he was desirous, as he himself said, of leaving as a legacy behind him. But, also like the great architect of St. Paul's, he was doomed to be disappointed; but the work proceeds, though others carry it on. A considerable portion of his plans for the completion of the approach to the Houses of Parliament has just been finished by his son, Mr. E. M. Barry, A.R.A., who succeeded his father as architect of the edifice. The story of Westminster Palace is naturally the principal feature of the book. The competition and its conditions, the difficulties with which Barry had to contend, and the annoyances to which he was subjected through the prejudice and ignorance of men in power, and the jealousy of professional brethren during the progress of the work, the doubts and fears of the architect as to the result of his labours, and the unpleasant dispute with the Board of Works on the question of remuneration, are all minutely described, and form a curiously interesting narrative. As was remarked in our former notice, Dr. Barry assumes that his father was the sole architect of the Houses, and does not recognize the claims that have been put forward on behalf of the late Mr. A. W. Pugin to be so considered. That question he reserves for discussion in a separate pamphlet which is now announced, and which we shall deal with when it appears. It is to be feared that his very onerous and harassing labours, and the extraneous annoyances to which we have alluded, in connection with the New Palace, continuing as they did for nearly a quarter of a century, had a very serious effect upon Sir C. Barry's health. Soon after the Houses were formally opened in 1852, he practically retired from his profession, though he continued to take the deepest interest in all architectural movements. His busy brain was planning and designing to the last, and it may indeed be said, that his pencil only dropped from his hand in the hour of death. He had had presentiments that his end was approaching. It came at last suddenly, on the 12th of May, 1860, but a few days before he had completed his sixty-fifth year. Sir C. Barry was not a great architect, in the same sense that Inigo Jones and Sir C. Wren, Michael Angelo and Palladio were great architects. He was rather a great worker; and for what he accomplished it cannot be said that he was not amply rewarded by the honours that were heaped upon him in his lifetime and after his death. His statue has a place within the walls of the greatest work with which his name is associated, and his mortal remains lie in Westminster Abbey. What greater honour could an Englishman desire? What greater honour could Englishmen confer? Of the manner in which Dr. Barry has performed his task, we will only say that it is hardly to be expected that a doctor of divinity would write a book on architecture that would satisfy the architectural profession. The work would have been more satisfactorily performed by a more practical, not to say a more disinterested pen. There are many evidences of this apparent throughout the Memoir. As a tribute of filial affection, rather than an impartial criticism, does it reflect credit on the biographer. The volume contains illustrations of the chief works of Sir Charles Barry, and is altogether handsomely got up.

ELEMENTS OF ENGINEERING.

CONTINUOUS BEAMS. II.

THE simplest case presenting itself for solution, with respect to continuous beams, having been succinctly investigated, we may now direct the attention of our readers to those instances which are necessarily endowed with a greater amount of complexity. This complication, both of calculation and geometrical analysis, may proceed from one of two, or from a double cause. It may be due either to the inequality of loading in the respective spans, which may be equal, or to an inequality in the dimensions of the spans themselves. There is scarcely any necessity for pointing out, that the latter case with an unequal loading, would be virtually identical with the former. Moreover, not only the respective spans may be unequal, but their respective loadings also. Before proceeding to an investigation of the question of continuous beam of three spans, that is one supported at four separate points, let us briefly consider the conditions attendant upon that of two spans when these spans are unequally loaded.

We pointed out in our last, that all railway bridges constructed upon the continuous principle were subject to this state of loading during the passage of every train, and that the effect was to shift the position of the points of contrary flexure nearer to the middle pier, thus really increasing the span of the beam beyond the limit assumed. With a load supposed uniform, the span of the girder between the abutment and the point of contrary flexure is equal to $\frac{3 \times L}{4}$, putting L for the total span from the central pier to either abutment. This is represented in fig. 1, where C A $= \frac{3 \times L}{4}$ and C D $=$ L. If we now imagine a railway train to be *in transitu* upon one of the spans, the points of contrary flexure A A become shifted to B B, and the proper span to be assumed for the girder C B is no longer $\frac{3 \times L}{4}$, but has some other value to be determined before its strength and relative proportions can be arrived at. We may ascertain this value as follows: — Let W represent the weight of the unloaded span, and W^1 that of the loaded beam. Making L as before the total span from C to D, then the distance C B, or the altered span of the beam, will be C B $= \frac{7 \times L}{8}\left(1 - \frac{W}{7W^1}\right)$. The value of this equation will evidently be greater than $\frac{3 \times L}{4}$, and it will immediately occur to those following our investigation, that in proportion as the distance C A is increased to C B, so may that of A D be diminished to B D. In other words, accordingly as the span of the beam is increased, so may that of the cantilever portion be shortened. Paradoxical as it may seem, this is not the case. Although that portion of the beam lying between the points C and A is to be calculated when under the conditions already mentioned, as extending from C to B, yet the cantilever portion is always to be regarded as reaching from D to A. The reason is because, when both spans are fully loaded, which might and would occur during the transit of a long and luggage train, the extreme limit of the cantilever part of the beam extends to A upon either side of the central support, and the extreme limits of variation is what must be provided for in the calculations. It is this variation which practically curtails the advantages of continuity.

Advancing to the more complicated problems in relation to beams of this description, let us consider that represented in fig. 2, in which the beam is supported on four points, A, B, C, D, placed at regular distances apart. The points of contrary flexure will be at G, E, H, F, and their position determines the respective spans of the beams A G, E H, F D, and of the cantilevers G E, and H F. These dimensions are not equal to those found for the case represented in fig. 1, but have a particular value of their own. Assuming, as before, L to equal the total span between any two of the supports, the distance G B or C F will be equal to $\frac{L}{5}$. The distance B E, H C, upon the other side of the intermediate supports, will not have the same value as might be expected, but will be greater. Thus B E $=$ H C $= \frac{L}{3{\cdot}62}$. Having now found the accurate positions of the points of contrary flexure in fig. 2, the spans of the individual beams composing the whole con-

tinuous structure can be readily ascertained. The two end portions, or those lying between the abutments, and the points of contrary flexure nearest to them, are identical in every respect. Since A G = F D = (A B — B G) = (C D — C F), substituting their values we have A G = F D = $\left(L - \frac{L}{5}\right) = \frac{4 \times L}{5}$. It has already been demonstrated that B E and H C are greater than B G or C F, and consequently the effective span of the central beam E H will be less than that of its two neighbours. The span or the distance E H may be thus determined. From the fig. E H = (B C — 2 B E) since B E and H G are equal. But B E = $\frac{L}{3{\cdot}62}$, and B C = L. We thus have E H = $\left(L - \frac{2\,L}{3{\cdot}62}\right) = \frac{L}{2{\cdot}23}$. To render this instance quite clear, let us suppose each span to equal 100ft, and we shall have the following dimensions for the different portions of the whole continuous beam. The side beams A G = F D = 80ft., and the central one E H = 44·8ft. The lengths of the cantilever portions will be G B = C F = 20ft., and B E = H C = 27·2ft. These dimensions are those to be adopted in calculating the strains upon the different portions of the beam. Following the same arrangement adhered to in our last article upon this subject, it will be useful to compare the maximum strains acting upon the beam, represented in fig. 2, with those belonging to a single girder, having a span equal to A B. The point of greatest strain in the side spans will be at x, and that in the central one at y. Upon the assumption that the maximum strain in the beam A B, if an independent one, is 1, that at x is 0·64; that at y is 0·20, and that over the supports B and C is 0·80. There is, therefore, a saving of 20 per cent. in the extreme limits of strain in favour of the continuous beam when applied to bridges composed of three equal spans. A very usual example of a bridge constructed upon the continuous principle is shown in fig. 3, where the centre span is double either of the side ones. In testing a large railway structure similar to this design, it was found that when the central beam was heavily loaded with a train of locomotives, and the side beams kept unloaded, the ends of the beams resting upon the abutments A and D, were lifted clean off their bearings. In more than one instance also, there has been a very close coincidence observed between the calculated positions of the points of contrary flexure and the places where they actually occurred. It is hardly necessary to remark that this desirable agreement between practice and theory can only be obtained by a rigid adherence to scientific principles, and a strict attention to the nature of the workmanship and the fidelity of the material.

From the consideration of beams of three spans, the next example claiming our attention is that where they are divided into four, and consequently supported at five separate intervals. Of this particular case the Britannia Bridge is unquestionably the finest example, and accordingly we have selected it in fig. 4 to illustrate our text. It is divided into two large equal central spans and two smaller equal side ones, the two former being each respectively double either of the latter.* Making L equal to the larger spans and L^1 equal to either of the smaller ones, the points of contrary flexure, W W, of the side span, will be at a distance from A of $\frac{L^1}{2}$. The point x or the distance B x will equal $\frac{L}{6{\cdot}20}$, and the distance y C will equal $\frac{L}{4{\cdot}46}$. The points of contrary flexure, upon the other half of the whole beam will be similarly situated with respect to their supports. It remains now to see to what extent the central spans are reduced in their effective dimensions by the adoption of the continuous principle; in other words, what is the value of the distance xy, the absolute span of the girder between bearings being equal to B C. From the fig. we have $x\ y = \frac{1}{2}\{(B\,C - (Bx + Cy)\}$. In this instance B$x$ will not equal Cy. Substituting in the equation the corresponding value of the letters, we obtain $xy = \left\{\left(L - \left(\frac{L}{6{\cdot}20} + \frac{L}{4{\cdot}46}\right)\right)\right\} = \frac{L}{1{\cdot}64}$. A comparison of the strains acting upon the various portions of the whole beam with that upon an independent beam having the same span, as one of the central girders B C, will show, as in the other cases, a balance in favour of this particular type of construction. Putting unity to express the maximum strain at the centre of the beam B C, regarded as an independent girder, that of the same beam, as shown in the fig., will be represented by 0·375. The strain over the supports B and D will be equal to 0·50, and that over C to 0·75.

Having treated in detail of the separate cases most usually presenting themselves in the construction of bridges upon the continuous principle, we may now refer to the example in which a beam is imagined to be supported at any number of points placed at equal distances apart. This, it may be remarked, is the general problem to be solved theoretically, those particular examples already investigated being deductions from it. The actual mathematical treatment of this question is invested with too much complexity to be given here, but those of our readers who may wish to follow out the elucidation will find it ably treated in "Moseley's Engineering." What is practically required, in order to calculate the strength of the beam, is the position of the points of contrary flexure x and y. Making L, as before, to equal the length of the span, the distance of the point x, from support number 1, or of y from No. 2 will be given by the simple equation $\frac{L\,(\sqrt{3} - 1)}{\sqrt{3}}$. As an example, let the spans of the continuous beam in fig. 5 be each 100 feet, then the points x and y will be situated at distances of 21 feet from their nearest supports, and consequently the beam is reduced in effective span from 100 to 58 feet. Independently of the economy in material theoretically demonstrated, in the adoption of the continuous principle, the deflection of a continuous beam is much less than that of a similarly proportioned independent girder. On the supposition that the beam is made perfectly continuous, a condition not carried out in practice, from the impossibility of accomplishing such a result, the deflection of each span of the beam represented in fig. 5 would amount to only one-fifth of that of a detached beam of the same span and proportions. We may also compare the deflection of one of the central spans in fig. 4, with that of a similar discontinuous beam, and it will be found to be in the ratio of nearly one-fourth. It will be noticed that in continuous beams, there is an upward deflection as well a downward one, and the manner in which the loading is arranged, determines which spans deflect in one direction, and which in the other. If we conceive the load to be placed only upon every alternate span, than those upon which it is acting will deflect in a vertical direction downwards, and the remainder upwards. In constructing continuous bridges, it is essential to bear in mind that rollers must be provided for the girders to rest upon at their bearings upon all the intermediate piers, and one of the abutments. We shall not now enter upon the practical question, whether rollers or sliding blocks are the better adapted for the purpose. There is no question but that rollers have been known to stick, and not allow the proper degree of expansion to take place, and in one notable instance the movement of the girder actually drew the masonry of the abutment out of the plumb. But carelessness in not attending to the rollers, and seeing that they perform their duty effectually, was the real cause of this mishap, and carelessness in dealing with blocks would produce precisely the same result. While acknowledging the theoretical superiority of the principle of continuity, the English engineers, as a rule, do not find that that superiority is altogether borne out in practice, and consequently but comparatively few bridges are constructed upon the system. We may refer to the Charing Cross and Blackfriars railway bridges, which afforded every opportunity, so far as equality of span and loading were concerned, for the adoption of it, but they are both constructed upon the discontinuous principle, in preference to the more scientific system. Our continental friends, however, are strong advocates for the continuous type of design, and occasionally commit themselves to many *tours de force* to carry out their favourite views. It is probable that the principle of continuity does not apply to flanged girders in a manner so favourable as to solid beams, which are but little used now.

* For a full description of this magnificent structure, the reader is referred to the well-known work of Mr. Edwin Clark.

MASONRY IN PARIS.

ONE of the most amusing, and at the same time one of the most instructive papers contributed to the "Records of Artizans," at the Paris Exhibition, is from the pen of Mr. Thomas Connolly. This paper deals principally with masonry and the masons of Paris—a subject which must be interesting to builders in this country. Our readers may judge of the value of the paper from the following extracts:—

In the science of construction, says Mr. Connolly, and the judicious use of the materials—stone, wood, and iron—the French architects display great skill. The right material is generally used in the right place. Their buildings being constructed as much as possible fire-proof, we seldom read of a great fire in Paris. They are generally well built, for the builder and the architect have to insure their stability for ten years, and are held accountable during that period for the expense of any repairs arising from imperfect workmanship or from defective materials. The fronts are all built of large stones, bedded and jointed, which run the full thickness of the wall. They are laid dry on each other, and afterwards run with plaster. There are openings left for the doors and windows, and projections for the cornices, mouldings, and carving. When the walls are carried to their full height, the masons work at the front of the building, commencing at the top; they finish and take down their scaffolding as they descend. The back and end walls are built with small squared stones on the outside, and with unsquared or rubble on the inside. They are bedded in plaster; very little care is used in the bedding of this rubble, as the plaster sets soon after the stone is laid. The flues to carry off the smoke are constructed with earthenware pipes built into the walls; and as those walls settle unequally on the foundations, you observe on every gable-end exposed to view that open joints are left close to the quoins, so that each wall may settle of itself, without drawing the other with it, and causing rents in the building. Those open joints may be filled up when the work is seasoned. The floors are constructed with light wrought-iron girders of an I section, laid about 2ft. apart, and arched from one to the other with hollow bricks bedded in plaster. The arches are very slightly curved and their springers rest on the bottom flanges of the girders. The soffit is dubbed up and made level for the plaster of the ceiling, and a slight piece of wood is laid on the top of each girder, to which the floor-boards are screwed. The staircases are all built of hard stone, with iron balusters and handrails. The halls and corridors are generally floored with marble squares, of various colours, of a composition of cement and marble chips, which is often a good imitation of mosaic. Very little wood is used, except for the flooring-boards, doors, windows, and roof. In all the houses which I have seen, the sanitary arrangements appear to be of a very defective character. Water is used very sparingly; in fact, they never

think of letting it run through their closets, although, judging from the liberality with which it is used in flushing the kennels of the public streets, Paris must be abundantly supplied.

When the ground has been excavated for the basement of a building, the stonework of that portion is usually bedded in mortar composed of lime and sand, or in cement mixed with sand, but all above the surface is bedded in pure plaster, the extensive use of which enables them to erect their buildings in a very short space of time, and to use any small pieces of stone in the cross-walls. The gypsum of which this plaster is made is raised at the Hill of Montmartre, in the suburbs of Paris, the supply of which, I learn, is almost exhausted. It is prepared close to the quarries, and brought to the works in sacks, where it is sold for 17fr. the cubic metre. It is a good, strong, coarse material; the ashes of the fuel used in the burning being allowed to intermix with the gypsum, but when required for exportation, or for finishing and ornamental work, it is passed through a very fine hair-sieve.

The stones chiefly used in Paris are oolites, of which of the harder and finer sorts there are thirteen varieties brought from the south, south-east, east, and centre of France, and some are raised in the immediate neighbourhood of Paris. The price varies with the quality and size of the blocks. For first-class stone, delivered at the works in blocks not smaller than 2½ metres long and 1½ thick, the cost is 193fr. the cubic metre; for blocks of 5¼ metres long by 2½ metres thick, 415fr. the cubic metre; and for blocks 6 metres long by 2½ metres thick the price is 518fr. the cubic metre. These stones are durable, and many of them will take a good polish. They are of various colours, but chiefly white or reddish-speckled, and are used in fountains, parapets, and copings of bridges, balconies to windows, and other ornamental work much exposed to the influence of the weather. They are also used in steps, floors, staircases, and other places where there is much wear. By a municipal regulation, the first story of every building erected in any of the principal streets of Paris must be built with hard stone, but the builder is at liberty to use soft stone for the remaining stories if he desires to do so. The wisdom of this regulation must be apparent to any person who examines the restorations which are now being done at the Palace of the Louvre. For several feet above the surface, through the influence of the damp arising from it, the stonework is completely decayed, while the remainder of the building above that level is comparatively sound and good. The soft stone which is used above the first story is a fine, even, close oolite, easily worked. It is like the stone we get from Bath and its neighbourhood, but of a much better description. There are two qualities of it raised within a circuit of fifty miles of Paris, and several of the quarries are close to it. Stone from St. Just may be purchased, delivered at the works in blocks of any size, at 68fr. the cubic metre, and the smaller size blocks at 37fr. to 40fr. the cubic metre. The cheapest stone used in Paris is that from St. Denis, in the department of Seine-et-Oise, which can be purchased, delivered at the works, for 30fr. the cubic metre. Those prices are little less, if any, than the cost of stone in London, where good Portland stone is purchased for 2s. 6d. a cubic foot, and Bath stone for 2s. 1d. the cubic foot. When delivered at the works, the blocks are cut up into the sizes required for the masons, in the same manner as it is done in London,—the soft stone with a cross-cut, and the hard stone with a frame-saw and sand and water; the men employed at this work receive from £6 to £9 a month.

As in London, the building erected in Paris is chiefly done by contract, but with the important difference, that each description of work is let to a contractor of that trade alone, whereas in London the entire works are let to one person. The contractors in Paris are usually men who have been brought up to the trade in connection with the works. They contract for, and will necessarily have the skill to direct it themselves. The London contractor, in most cases, is not brought up to any of the building trades; he merely finds the capital, and some other persons supply the brains. It is clear that a better description of work is the result of the French system, where it is executed under the personal superintendence of a man who understands it, and who has a personal interest in its proper execution; and that there are greater facilities for a steady, industrious workman to advance himself and become a contractor some day. This method of contracting existed in London before the concentration of capital in the hands of a few; and it is still practised in many of our provincial towns, with the same beneficial result as at Paris.

The mason's contract, in addition to the stonework, includes the plastering and the brickwork. Of the latter there is very little done in Paris. I have only observed an odd house built of brick. I presume the cost, which is 60fr. per thousand for middling bricks, is some impediment to its more extensive use.

The bricklayer and the plasterer are not distinct trades, as in London, but are included in the mason's trade, the operatives of which are classified into limousins, poseurs, and ravaleurs. The limousins, or wallers, build the sewers, drains, and basement story of the building with rubble stone, and, as this description of work requires very little skill to execute it, the men employed being nothing more than handy labourers, they are paid from 4½ to 4¾fr. per day, which is only a fraction more than is paid to the navvies who get out the ground for the basement, and who receive from 4 to 4½fr. per day. The masons who fix the stones of which the fronts are built, are called poseurs; they generally confine themselves to this branch of the trade. Their method of fixing, as before stated, is to lay the stones dry into their places, and when the course is completed to run the joints with plaster. In large buildings, where the walls are raised to a great height and the stones press heavily on each other, to preserve them from flushing, the plaster is prevented from running to the front by placing thin pieces of wood, about 2½in. broad, in the joints, which are slipped out when the plaster sets, and when the walls settle those open joints are pointed up. Owing to this precaution of directing the weight on the centre of the stones, you will very rarely see the mouldings or other ornamental work on the face of a building flushed through pressure. Except in marble or polished work, the French masons use very little care with the beds and joint of the stonework; they are often ¾in. apart, but, as the plaster with which they are filled is almost as durable as the stone, and like it in colour, it does not affect the general appearance of the building. The skill of the poseur does not seem to be highly estimated, as his wages are only 5½fr. a day, or 1½fr. less than the ravaleur, which comprises two classes, viz., ravaleurs in plaster and ravaleurs in stone. The ravaleurs in plaster erect all the walls of the building above the basement, in which small squared or rubble stone is used. They build all the fire-places and flues, and turn the brick arches for the floors. When the house is covered in with slates or tiles, they coat all the walls with plaster, and form the ceiling and cornices. The plaster used for building the walls is mixed with water, in a wooden trough, the sides of which slope outwards towards the top. It is brought to the scaffold by the labourer, on his head, and when it sets a little the ravaleur spreads it on the wall with his trowel or hands—he is not particular which—and beds the stone; the stones are placed dry in the centre of the wall, and afterwards grouted with thin plaster. The ceilings and walls are all finished with one coat of whatever thickness may be required by the unevenness of the walls, which he ascertains by plumbing-screeds or narrow strips of plaster at each angle of the room, and at convenient distances from each other. Between the screeds he puts on wet plaster with a broom, his hands, or the trowel, and forms the surface of it level with the edge of a long, straight trowel, having teeth like a fine saw; a little thin plaster laid on and rubbed with the flat of a trowel makes it a fine, smooth surface. The cornices are made of pure plaster, and run with a mould; but when very large and ornamental, they are done by moulders, who make them of a composition of plaster, whitening, and glue, in which flax fibres are intermixed to add strength. It is hollowed at the back, and made so light and yet so strong, that it may be attached with plaster, or nailed to the walls and ceiling. The ravaleurs in plaster are a very useful and skilled class of workmen, and are paid 6fr. a day. The trowels and other tools used by them are very awkward and clumsily made, and, although those men execute some excellent work, they do it in a very unworkmanlike manner. You seldom see an English operative use plaster or mortar with his hand, while he has a tool to do it with.

The ravaleur in stone corresponds to the trade of a mason in London, but, as the principal part of the work in Paris is executed in soft stone, and after the walls are built, while in London it is done with hard stone, worked on the banker before it is fixed, the method of working in the two places is entirely different, and one would have some difficulty in using the tools of the other without considerable experience. The ravaleurs in stone are divided into two classes, namely, those who finish the fronts of the building, and those who work the beds and joints of the stones before they are fixed. This latter class are called "tailleurs de pierre." The blocks of stone for a building are generally deposited near its site if there is room, and, if not, on the next convenient open space; and when cut into the required sizes, those men work the beds and joints, and, if the stone is required for a moulding or cornice, they scribe on the mould and chamfer off the surplus. They seldom use a mallet and chisel, except to run a draft around the arris, but work the stone with a pick, a tooth-axe, and a diamond hammer. The mallet and chisel they use very imperfectly, but the pick and axe they use with great dexterity, and turn out a great quantity of that kind of work. They never banker a stone to work it, but merely lift it on a slant, and seldom turn it more than once before it is finished. They have no sheds to protect them from the weather, and are paid at the rate of 6fr. per day.

The ravaleurs who work the fronts of the buildings are the most skilful men in the trade, and are paid 7fr. a day when employed at day-work; but, as a gang of men generally do the work of a front by contract, they often earn more than day-wages; but when an architect requires to have his work well done, he will not allow it to be done by contract. Mons. Duc, the architect of the Palace of Justice, would have the front of that building done by day work, and it is plainly observable how superior the work is to that of the Tribunal of Commerce, which was executed by contract. For the ravaleurs to do their work, a scaffold is erected to the front, as the walls of most edifices are built overhand; then, commencing at the top cornice, they cut in the mould at each end, and, with a piece of twine, rubbed with red chalk, strained from end to end, they strike the horizontal lines, pitching off the waste from the front with a hammer and chisel; they then work it very close with a tooth-axe, and finish it off with a diamond hammer, or a plane, when the surface requires to be made smooth. Those planes are about 9 or 10 inches long, having two irons, one in the middle and one in the front, to enable it to cut into an angle. The irons are merely thin pieces of steel or saw-plate, slightly bevelled on the cutting edge. The ravaleurs have a number of those planes, of all shapes and sizes, with which they work the mouldings on stone, just as a joiner would make them on wood. They seldom use a mallet and chisel, and when they do, it is very awkwardly, but execute their work chiefly with the pick, axe, diamond hammer, and plane. It is astonishing with what celerity they finish off the front of a building, but everything is in their favour; the stone, being a nice fine quality, is not flushed at the joints or the ends by the working of the plane or axe, and the stones, being the full thickness of the wall, are not disturbed on their beds by the working. There is certainly something to say in favour of this system of working stone after the wall is built. In the first place, no time is wasted on the parts that are not exposed to view; and, in the next place, the lines will be more accurate, as they are struck the full length or the full height of the building; and, although much of their stone-work is not so perfectly masoned, and will not bear so minute an examination as stone-work in London, their buildings will look better, owing to that circumstance. However perfectly the stones may be worked on the banker, unless they are carefully fixed, you will not have the lines straight, and you cannot make them so without disfiguring the mouldings.

At the last meeting of the Institution of Civil Engineers, a report was brought up from the council stating that, under the provisions of Section IV. of the Bye-Laws, the following candidates had been admitted students of the institution:—Henry Adams, Charles Augustus Alberga, Robert William Peregrine Birch, John Montriou Campion, Lindsay Heath, Arthur Willoughby Hemans, Osbert Henry Howarth, William Henry King, Frank Howard Landon, Arthur Hemery Le Breton, Frederick Herbert Mollett, George Pullin Pocock, George Henry Roberts, Edward Lee Robertson, Dampier Seabrook Shaw, James Henry Waller, and Francis Wilton.

PRIZES FOR ART WORKMEN AT THE SOCIETY OF ARTS.

OF the numerous contrasts presented by the Middle Ages and modern civilization, none are more prominent than the free trade of the latter as compared with the protective legislation of the former. There can be but little doubt as to the advantages of free trade as regards commerce in general; but when we come to what in the present day is called art workmanship, or art applied to industry, we are much inclined to pause before giving a final decision. Thus, it is very true that anciently a master could only take a certain number of apprentices; that those apprentices served for five years, and, in some instances, longer; that the apprentice could not open shop and be received as master until he had presented a specimen of his work, which had to be passed by the authorities of his guild. When released from his apprenticeship, he engaged himself for a certain time, somewhat like the farm servant of the present day. When master, he was to confine himself strictly to his branch of the trade, he was not to work at night, except in certain cases, and he was to conform to the statutes of his corporation—*i. e.*, the trades' union of the day.

All this appears very hard to us of the present time, but thus much must be said for the mediæval trades' unions, which cannot be alleged on the part of their successors—viz., that their functions did not terminate with protecting the workmen; on the contrary, they went further, and protected the public. The production of the "chef d'œuvre," or masterpiece, which, in some cases, was required at several stages of the workman's career, was a guarantee that no one was admitted who was not up to the mark; and, again, the public was still more protected by the appointment of sundry officers taken from the corporation yearly, whose duty it was to go round and condemn such bad material and bad workmanship as they might chance to find, by subjecting the delinquent to a fine. We have changed all this system—whether wisely or not remains to be proved. Certain it is that, if an article has to be produced in large quantities by means of our subdivision of labour, we are enabled to do it tolerably perfect and much cheaper than it would have been done formerly, but when we come to exceptional things the difficulty of obtaining competent workmen is enormous, more especially when it becomes a question of the higher application of art to industry—such as the carving of figures in wood for ecclesiastical furniture. It is to stimulate such branches of industry that the Architectural Museum and Society of Arts have been accustomed to invite competition for certain definite works, and to give prizes for the objects sent in. It is almost needless to say that the effect of such efforts must fall very far short indeed of the system of the chef d'œuvre of the Middle Ages. Still it is the only substitute we have, and of such we must be thankful. The financial position of the Architectural Museum never allowed that institute to follow out the scheme to any extent, and last year no prizes at all were offered, owing to the funds being absorbed in the erection of the new building at Westminster. The Society of Arts has at present, therefore, the field to itself, though it is to be hoped this will not be the case for a very long time. The productions of the various workmen are now on view at the Society's rooms, and will remain so for about a month. This year the subjects appear to have been well chosen, and the rewards very fair. The consequence is that a very decent number of workmen have replied to the invitation.

The subjects are thus divided, viz., subjects sent in accordance with a prescribed design, and those sent in without any prescribed design. In the former case, a case and a photograph of the object to be copied were furnished to competitors upon payment of a small sum sufficient to cover the expenses.

It appears that the old trades' corporations are not altogether dissociated from the present scheme, for the Worshipful Company of Salters contribute £10 annually to the prize fund, so also does the Worshipful Company of Clothworkers, while the Goldsmiths' Company give £15 for the encouragement of workmen in the precious metals. Considering the funds at their disposal, and the very slight influence they have upon their respective crafts at the present time, it is to be regretted that the example of the Salters', Clothworkers', and Goldsmiths' Companies is not more followed. The Paperstainers used to have, I believe, an annual exhibition of their own—an example which might well be followed by so important a company as the Goldsmiths', for an apprentice or workman would doubtless value more a reward given to him by his own craft, than one by the Society of Arts. At the same time there would be no objection to the objects sent into the Goldsmiths' Hall, or to the hall of any other company which might see fit to have an exhibition of their own, being sent to swell the general exhibition at the Society of Arts.

I am afraid that it would be impossible, even if it were altogether desirable, to go back to the mediæval system of close corporations. Our only chance of progress is to work out the best points of the new system, and one of the best points is certainly these periodical exhibitions, such as we have now at the Society of Arts. What we have to do is to make these exhibitions as important as possible, so that, instead of some ninety-four articles being sent in as in the present case, we may count ten times the number. As before observed, the smaller and local exhibitions might send in their best objects to swell the great one at the Society of Arts. It only remains to say a few words upon the conditions imposed upon the competitors, and the various kinds of work demanded.

The conditions are as follows:—The works remain the property of the producers, but are subject to be retained for exhibition in London and elsewhere as long as the Society may decide. It is to be hoped that "elsewhere" may hereafter mean Manchester, Liverpool, Sheffield, and one or two more of our great centres of manufacture.

The exhibitors are required to put a selling price to every article, and, if sold previously to exhibition, to state the price of a copy. This is a most important and practical regulation, and would lead to most valuable results in the case of provincial exhibitions.

Clause 3 provides that the rewards will be paid, provided the works are of sufficient merit, *i. e.*, that the rewards will not be given to the best of bad work, but, on the other hand, additional sums and the Society's medal are the rewards of extraordinary merit.

The candidate must be prepared to execute some piece of work, if required, to prove his competency. Only *bona fide* workmen can receive prizes. No charge upon the sales of the articles. The prizes are open to both males and females, and there are, in addition, a certain class of prizes set apart for females alone. Article 9 is a very important one. Any producer can exhibit, either in his own name or that of his workman, provided that the name of the artizan or artizans be appended; and, if their work be sufficiently meritorious, extra prizes are given to the artizan, the producer, it is presumed, taking the original one.

Artizans may exhibit works executed after other designs than those prescribed, but they must be of a similar style and character. The works may be sent in either with the name of the artizan, or with a cipher, accompanied by a sealed envelope, &c. This latter is the only point in the instructions at all open to objection: no man ought to be ashamed of his work; if it be good, he should have all the credit; if bad, he will deserve all the blame; and it is more than probable that the strictures he incurs may determine him to do better the next time.

The prospectus of the Society finishes with the following very satisfactory statement:—

"The council are happy to announce that several of the works which received the first prizes in the competitions of 1863-64-65-66-67, have been purchased by the Department of Science and Art, to be exhibited in the South Kensington Museum, and the Art Schools in the United Kingdom."

It is to be hoped that the Society will go on in its good work, and that their exhibition will eventually become one of the great exhibitions of the season, and claim an equal amount of interest as those of the Academy, or the Water Colours; it will certainly be quite as useful to the manufactories of the kingdom as they are to Fine Arts.

Next week I propose to give an account of the various prescribed designs, and of the competitors who have responded to the Society's call.

W. BURGES.

THE UNION BANK OF LONDON.

THIS building, of which we give an illustration this week, has recently been erected on one of the finest sites in the City, opposite the Mansion House, and will be a conspicuous object from the proposed new street which will lead from the Thames Embankment to Mansion House-street. The façade is as yet incomplete, the leases of the houses on the Princes-street side not having expired. The works were for some time delayed whilst arrangements were pending for the widening of the street; and eventually the building was set back 10ft., that space being given to the public thoroughfare. The foundations had to be made at the unusual depth of 30ft. (in consequence of the site having been that of the ancient river Walbrook), being a little below the old Roman level of the City. In the course of the work a few Roman coins and a very complete portion of a tile pavement were discovered, with timber piles and other remains. The present frontage in Mansion House-street is 89ft., which will hereafter be considerably extended, and in St. Mildred's-court the frontage is 70ft. The stone dormer windows break the balustrade, which is backed by a roof noticeable for its pitch, giving a sky line far more pleasing than is usually obtained by a hard line of the regulation balustrade, disguising roof and chimneys. The grouping of the windows has been well arranged to give relief to the façade, and the centre bays have been brought forward to suit an irregular line of frontage. The entrance in Mansion House-street (which has a bold polished red granite architrave) leads to suites of offices on the first, second, and third floors, the whole of the ground floor being used for the business of the bank, as are the basement and upper floors of the building in St. Mildred's-court, the entrance to the bank itself being in Princes-street, in the older portion of the building, which was erected by Mr. Philip Hardwick, R.A., as offices for the Great-Western Railway company.

Internally, the centre of the banking office is well lighted and ventilated from a dome 39ft. in diameter, intersected by arches springing from eight columns supporting it, round which and also carried by them is a gallery on the back of the first floor of the old building in Princes-street. The ornamental iron gallery front defines the octagonal form of the dome on plan, four of its sides being longer and four shorter. In the centre of a ring which stops the moulded ribs of the dome is a large sun-burner. The floors throughout are of fireproof construction, this part of the work being done by Mr. Barrett. Messrs. Cubitt and Co. are the contractors, Mr. Bridgman having been an efficient clerk of works.

The business of the bank has not been impeded during the progress of the works.

The announcement which has recently appeared in the daily papers to the effect that the reconstruction of Her Majesty's Theatre had been commenced, and that the new building, which it was said would cost £250,000, would eclipse in grandeur every other opera house in Europe, has received an authoritative contradiction. The ruins of the old edifice are being cleared away "to save time," but no decision has yet been arrived at as to the appointment of an architect, or the ultimate disposition of its site. In all probability there will be limited competition.

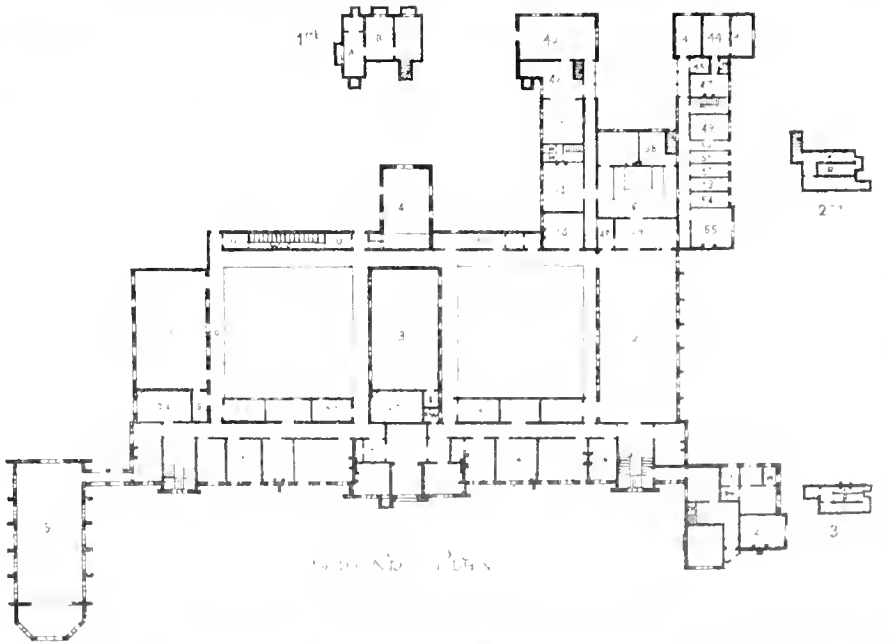
Middle-Class College,

BEDFORD.

Mr. FRED. PECK, ARCH.T.



DARLINGTON UNION WORKHOUSE COMPETITION.

(COMMUNICATED.)

EIGHTEEN designs or sets of drawings have been received for the Darlington Union New Workhouse, which are now on view (admission sixpence each) in the Central Hall.

Perhaps the sight is worth sixpence to some people; and non-resident competitors may be thankful that such a degree of publicity is granted. If the guardians would go further, and remove the prohibition they have imposed against the use of pencil in the room, it would be further advantageous to the spirit of fair-play which seems to actuate them, as giving to members of the press licence, or, at any rate, opportunity of fair criticism, and a due public canvassing of relative merits. It is to be hoped that they will remove this restriction, which the discontented might say was intended to stifle criticism. It is certainly undesirable that unscrupulous "persons" belonging to the "profession" should be allowed to sketch and take ideas from the works of their brethren so exhibited, and sketching is, therefore, very properly prohibited; and probably few persons capable of making good use of good ideas, would care to acquire them in such a way. Taking notes and observations on the spot, however, is very different. Owing to the restriction alluded to above, we cannot go through the drawings *seriatim*, as we have nothing but our memory to guide us. The "usual amount of rubbish"—the inalienable rubbish of a competition—however, remains indelibly impressed on our minds.

The first set on the left-hand side on entering, marked "Alpha," is ascribed to a local architect. It is certainly a juvenile production, drawn apparently without regard to scale—as to doors, windows, &c., at any rate. It is almost the only set in the room that offends in a glaring manner against the "instructions," which explicitly interdicted colour in the elevations—an interdict totally disregarded by "Alpha," who has coloured his bricks as red as colour can make them. The plan itself is very striking and original, as it presents four large quadrangles in the workhouse building, around which the various wards are arranged, two storeys in height. As no corridors are provided, and no covered ways, it is difficult to see how communication is to be effected in inclement weather without exposure or disturbance; or how the necessary surveillance by night, or attendance by day, can be managed properly. The kitchen is placed in the middle of the house, with nothing to intervene between the smells thereof, and without a scullery or other necessary adjuncts. It is figured 19ft. by 40ft.; and the next apartment, the matron's room, is lighted only by a borrowed light 23ft. from any window. The dining-hall is figured the same width, by 60ft. in length, and has bed-rooms over it. The whole involves hopeless confusion, and renders inspection possible only under the most inconvenient circumstances. The consequences of the bold idea of dispensing with corridors entirely, which has seduced the author of this design, are hereby plainly shown to be similar to cutting a man's legs off and bidding him walk. As to the elevations, we need only remark that they show a battlemented parapet in brickwork, all around every building, and a label moulding, which also forms part of the jambs and soffits of the windows. A bird's eye might well ache if it beheld such a view as is here presented to it, one executed to all appearance with a very stumpy quill pen, by a rival of Kit Nubbles, when that accomplished youth took lessons in writing in the "Old Curiosity Shop."

It is a relief to turn to the pleasant drawings marked "Suum Cuique," whose author, however, has made the mistake of providing more accommodation than is asked for. It is a modest and simple design, and the designer has very wisely placed his faith in a well-drawn plan.

"Palmam qui meruit ferat" contributes a very expensive plan, breaking up the several departments into a great number of separate buildings. Although there are considerable advantages attending this plan, we cannot help thinking that it would render the service expensive, and perhaps troublesome, whilst the effect of covering the whole site with small buildings is anything but pleasing. The general model resembles the Oxford Workhouse, and has a large chapel, with apsidal chancel and transepts, beyond the dining-hall, whilst the majority of the competitors agree in the advisability of using one room for both these purposes. The hall itself, too, is surrounded by a corridor, an arrangement which seems to entail a considerable loss of space, and to render the hall gloomy and its ventilation difficult. This error is shared by many of the competitors. The elevations are very suitably designed.

Another motto ("Palmam non sine pulvere") escapes the error of enclosing the dining-hall, and places the kitchen in a half basement. The view of this design looks cheerful and open; and the arrangement of the buildings gives easy access to the infirmary, which, in most of the designs, is placed in the rear. The author of this set favours us with the only interior view of a dining-hall contributed. The drawings are quiet in tone, and the plan seems to have been duly considered.

"Poverty is no sin" (except in design) is the signature attached to the largest set of drawings in the room—namely, eleven in number, several of them of large dimensions, and the whole boldly drawn. The plan has merits in its general arrangements, which impressed themselves on our mind, as did also some few awkward features; and we lament that the design is liable to be considered sinful on account of its poverty.

"Spero" has sent a very modest set of drawings, only four in number, if we remember rightly, which seemed to us inadequate to do justice to the evidently careful way in which the plan has been studied; and his modesty is all the more conspicuous by being located next to the large and pretentious drawings last described.

Of the remainder, which are now somewhat confused in our memory, those of any architectural pretensions are too architectural, one or two aiming at pure Greek; one giving to his infirmary building turrets joined by circular wings at the angles, which call to mind the plans of Blenheim or Kedlestone; another presenting a beautifully-lined and well-coloured Italian elevation with plenty of cut and moulded stone-work about it, and so on. The happy medium of architectural dignity, without costliness, on the one hand, or repulsive poverty on the other, is only touched by two or three in the room; and few of the competitors, obviously, have had little inducement, in the shape of previous study of poor-houses, to enter the lists.

Probably, however, the guardians will be able to find, amongst the designs exhibited, some approximation to their wants; and, as they propose to give £30 and £20 respectively to their second and third favourites, and to retain their drawings, they will be able to worry their chosen architect into embodying all the merits of these designs, for which they so liberally pay. Competitors who have entered into the contest with this condition before their eyes, have allowed the time for objection to go past, and to lookers-on, who like to see go past, and to lookers-on, who like to see measure for measure, there remains an arithmetical puzzle frequently matched on such occasions. Those unfortunate beings into whose hands the award of competition falls, feel in a peculiar degree the dilemma of the old man and his donkey; but there exist, in spite of all complaints, some sensible persons who can see when they are beaten, and who will recognize, let us hope with becoming gratitude, all efforts to secure the best place for the best man—to give the prize where it is deserved. To effect this object, it has been proposed to call in professional advice, a course which the guardians would do well to adopt. We would suggest that competitors, especially those who are well known in the town, should be excluded from the room after the first visit—if not by their own good sense and good feeling, by the prohibition of the powers that be. We saw several persons, who appeared to us to be competitors, discanting on the merits of their own, and pointing out the blemishes of others' works; and, as there are *seven* resident competitors, and the ownership of the designs seems to be no mystery, the practice alluded to is calculated to give them undue advantage.

BEDFORDSHIRE MIDDLE-CLASS COLLEGE.

THIS building is now being erected at Bedford. The college is arranged to accommodate 300 boys. It is a red brick building, with stone dressings to windows. The building faces the high road, and will be seen from all the railways entering Bedford. A separate residence for the head master is provided, and arrangements are made for the under-masters and domestic servants.

The college is supported by the Duke of Bedford, Lord Cowper, and other influential gentlemen of the county; and it is intended to board and educate the sons of the middle classes for the annual payment of £25.

The building has been designed by Mr. Frederick Peck, and is being erected by Mr. William Huddleston, of Lincoln. The cost of the college, exclusive of fittings, is £12,000. It should be added that a competition was invited, that about fifty competitors sent in designs, and that those of Mr. Peck were selected.

DEVONSHIRE ARCHÆOLOGICAL SOCIETY.

WE are glad to see that an attempt has at length been made to form an Archæological Society for the County of Devon. This is a want which has been long felt, particularly by those more immediately interested in the county's history and antiquities. Last week a meeting convened by circular was held in Exeter to consider the subject. Mr. Charles Tucker, F.S.A., one of the hon. secretaries of the Royal Archæological Institute, was voted to the chair, and there were also present—The Rev. Canon Cook Lieut.-Col. Harding, F.G.S., Dr. Scott, Messrs. Jno. Carew, W. R. Crabbe, W. Vicary, R. Sanders, E Ashworth, R. Dymond, T. J. Bremridge, E. Parfitt, and G. T. Donisthorpe.

The CHAIRMAN observed that Devonshire was rather late in taking steps to form an archæological society. Out of the Archæological Institute, which he joined twenty years ago, had grown eleven county societies, and he should be glad to see the dozen made up by the addition of Devonshire to the list. These had continued in correspondence with the Institute since their establishment, and a great deal had been done by them towards preserving objects of historical interest which would otherwise have been pulled down and destroyed. The Institute have even diverted a railroad from going through those wonderful mounds known as the Bastlow-hills, on the borders of Cambridgeshire and Essex, the railway directors, on representations being made to them, consenting to divert the line from the contemplated route. A little well directed energy sometimes did great public good, and in many instances could be better brought to bear by a society than by individuals separately. There were still in Exeter several ancient objects worthy of preservation, and in the county there was a large number of the earliest remains of human intelligence in the form of temples. A society would be serviceable in preventing the destruction of these relics of past ages. In connection with a society at Salisbury, one of the best of the provincial museums had been formed. There were suitable objects for investigation in Devon, the county contained its full share of intelligent people, and he had no doubt that an archæological society would be well supported.

MR. CRABBE said that objects deserving the attention of such an association could not be otherwise than numerous in the second largest county in England. Throughout its length and breadth were scattered remains of great interest. There were early Celtic remains on Dartmoor; numerous traces of that mysterious priesthood of Druids, whose dark rites were surrounded by the gloom

of centuries; and to Roman remains he need hardly refer, standing as he was close to the Roman forum of the ancient city of Exeter. Saxon, Danish, and Norman remains were to be met with in all parts of Devon, especially of the Danes, who, being pirates, clung to the seaboard and inhabited our Devonshire coasts. Little was known about the Hubba stone, and the many evidences of the Danish occupation—in fact the archæology of Devonshire down to the wars of the Charleses was a sealed book. The archæology of Devon had never been taken up by any society, but had been left to dwindle, and if it was to be revived, it must be through the medium of a society like that they proposed now to originate. He proposed that a society, composed of a president, two vice presidents, general district and local secretaries, a treasurer, and a committee, be established, for pursuing archæological researches in the county of Devon.

Lieutenant Colonel HARDING seconded the proposition, and expressed his gratification at the probable formation of such a society on a firm basis.

The motion was adopted, and, after some further conversation, the following appointments were made:—President, E. Smirke, F.S.A., Vice-Warden of the Stannaries. Vice Presidents, J. Carew, C. Tucker, F.S.A. Committee, Canon Cook, Dr. Blackall, Prebendary Barnes, J. E. C. Walkey, Dr. Scott, R. Dymond, Rev. W. Wills, E. Parfitt, W. Miles, Dr. Shapter, and W. Vicary, with power to add to their number. Treasurer, R. Sanders. Secretaries, Lieutenant-Colonel Harding, F.G.S., and W. R. Crabbe.

It was arranged that an adjourned meeting should be held in a month, to receive a report from the committee as to the constitution of the society.

IMPORTANT DISCOVERIES OF ROMAN REMAINS.

AT the last monthly meeting of the Newcastle Society of Antiquaries, an interesting paper was read on the recent excavations at the station of Cilurnum. The paper, which was from the pen of Mr. John Clayton, was, in the absence of that gentleman, read by Dr. Bruce, and tends to throw further light on the history of the Roman fortifications in the North. After noticing Julius Agricola's erection of the station of Cilurnum, and its connection with the great wall by Hadrian—the latter being the avowed object of the excavation—the report proceeded to state that the two structures are obviously distinct and separate works, and, though they touch each other, there is no intermixture of masonry. The station has six gates, like that of Amboglauna, and both were placed on the Roman roads formed anterior to the walls. The coins unearthed by these operations are altogether imperial, ranging from Trajan (A.D. 97) to Valerian (A.D. 375), and, with one or two exceptions, are made of brass. One of the coins of Trajan—found on the floor of the Agricola period—is a fine specimen of the produce of the Roman mints; it is of the 5th consulate of Trajan (A.D. 100), having on its reverse a figure of Victory placing a wreath of laurel on the head of the Emperor, who holds in his right hand a thunderbolt, and in his left a spear, with the legend:—

SENATVS POPVLVS que ROMANVS
OPTIMO PRINCIPI.

On the floor of the Hadrian period was found a tablet inscribed to his immediate successor, Antoninus Pius. The stone has been broken, but enough remains to render the whole legible, with the exception of the number and style of the legion, which are supplied with sufficient certainty from other sources. The letters stand thus:—

IMP - CÆS - TITO - ÆL
(I) - HADR - ANTONI
NO - AVG - PIO - PP
COS - LEG - II - AVG - P

which, being extended, read "Imperatori Cæsari Tito ÆLIO Hadriano Antonino Augusto Pio Patri Patriæ Consulari Legio Secunda Augusta Posuit." The stone commemorates no work, but is merely a complimentary tablet inscribed by the second legion to the Emperor Antoninus Pius on his accession. The minor antiquities disclosed were horns and bones of deer and cattle, oyster shells, Samian ware, two seals separated from their settings—the one a cornelian stone, on which is a figure of Mercury, and the other of jasper, containing the figure of a Roman soldier; while in the works of the Agricola period was dug up mineral coal, showing that the Romans had discovered, at an early period, that in Northumberland there was beneath the surface a material calculated to mollify its climate.

FIRES IN LONDON AND PARIS.

ON the subject of fires, the "Society of Arts Journal" remarks that few facts are more remarkable than the small amount of damage done by fire in Paris, yet the number of persons in each house, and consequently the number of fires, is very much larger than in London; and, although the number of firemen is three or four times larger in the former than in the latter city, the engines are mere garden toys compared with those of the London brigade, to say nothing of the steam fire-engines. The comparative immunity from fire may be accounted for, in part, by the very crowding of the houses which would seem to be a source of danger; each family occupies only one floor, and consequently there is little chance of a fire smouldering for hours without being discovered, but the grand difference in favour of modern French houses, as compared with those of London, arises from their superior construction. In the first place, timber is almost entirely banished; the beams, girders, and flooring-joists are all of iron, and the spaces between them filled in with brick arches and mortar; this arrangement not only renders the floors nearly fire-proof, but it excludes noise, and affords little shelter for vermin. Then again, the floors themselves are composed of thick oak parquet, instead of inflammable deal boards; while those of the kitchens, pantries, and offices are mostly of tile. The staircases, it is true, present some danger, but nothing compared to that which surrounds the flimsy constructions in London houses. It might be added that in a great many instances, not only are the stairs of houses made of stone (as is the case in many parts of Scotland), but the floors even of bedrooms are, to a large extent, constructed of concrete, thus rendering fire when it happens less destructive and dangerous.

ANTHRACITE COAL.

THE North London Railway Company are at present making an experiment which is likely to have a very beneficial effect upon the sanitary condition of London. For some months past they have used anthracite instead of bituminous coal, and the result is highly satisfactory. It would appear to be an easy matter to substitute one coal for another, but the change usually involves some trouble to the officials, and is not made until a necessity arises. In the case of the North London necessity came upon them in the shape of numerous actions or threatened actions for damages for the emission of "opaque smoke." By the use of anthracite coal the company not only avoid all ground of complaint, but they effect an actual saving it is said of several thousand pounds per annum. The coal is found to be 25 per cent. more effective than the bituminous coal previously used. We have thus another evidence that the emission of opaque smoke is an unnecessary evil, and one which ought under no circumstances to be allowed.

ACTION BY AN ARCHITECT.

A CURIOUS case was heard the other day in the Manchester Court of Record. Mr. Thomas Waddingham, jun., a Manchester architect, brought an action against the Rev. Joseph Steinthal, Minister of the German Evangelical Church, to recover £15 15s., for plans which he alleged he had drawn by order of the defendant. The plaintiff's case was briefly this. In February, 1866, the defendant called on him in reference to the erection of a church and school. They inspected the site of the proposed building in Park-street, Cheetham, and the defendant directed him to prepare plans, but not to go to much expense. It was arranged between them that the schoolroom should be in the rear of the church, and that the chancel wall should also be the wall of the schools. The defendant asked him what were his terms, and the plaintiff replied five per cent. upon the amount expended on the intended buildings. Plans were accordingly prepared, and all the work which the plaintiff did was done, he said, upon the faith of the defendant's representations that the building of the chapel would be carried ont. The plaintiff now claimed ten guineas for the plans which he had drawn for the church, which has not yet been built, and the breach of agreement was alleged to have been committed on June 15, when the defendant said that, in consequence of the German war affecting the amount of his contribution, he could not build his chapel, and that he must build his school-house as a detached building. Plaintiff also claimed five guineas for copies of plans, which he had made for the use of the defendant's committee. The defence was that the plaintiff was only engaged to draw the plan of the schoolroom, for which he had been paid, and he was told that as to the other buildings the defendant would have to wait until the money was obtained, and that as to them the plaintiff undertook the risk of being paid for his plans. As to the extra plans for the committee, the defendant alleged that Mr. Waddingham agreed to include these in his per centage remuneration. The recorder, in summing up the case to the jury, said, he could not help remarking that which he was constantly telling juries in Manchester, that it was a great pity that people did not, before they entered into such an agreement as was the basis of this action, put it into writing, because then there could be no difference between them as to its terms. However that fault seemed to have been committed by each party in this case, and it was one which people frequently committed. Everything being smooth and easy at the time, they thought such a state of things would continue; they did not foresee difficulties, and did not look forward to a time when they would have to rely on a very inefficient recollection of what took place. The jury retired, and, after a consultation of nearly half an hour, returned into court with a verdict for the defendant.

TECHNICAL EDUCATION.

THE second of a series of conferences on this subject was held on Thursday week, at the offices of the Working Men's Club and Institute Union, Mr. Hodgson Pratt in the chair, for the further consideration of the state of the present existing literature relative to the cabinet maker's trade. Only a small number was present. The chairman having read the minutes of the last meeting, invited any present to offer any remarks on the subject. Mr. Lucraft thought that books and manuals by themselves would never do any good, and advocated the establishment of a technical trade museum, with library, and courses of lectures on the various trades. He was, however, reminded by the chairman, that his suggestion was somewhat out of order, as the question before the meeting was trade literature, and its existence and possibilities of further development, and not whether it answered its purpose or not. He was, however, sure that Mr. Lucraft's scheme would meet with every attention, if propounded at the ensuing conference of the Society of Arts of the 23rd inst. Mr. Lucraft, Mr. Hall, and Mr. Paterson, were ultimately invited to draw up against the next meeting a series of the different heads or chapters of which a standard trade manual, which it is proposed to compile, should consist. This the two last-named gentlemen consented to do. It was then proposed and agreed that an advertisement should be inserted in the "Publishers' Circular," or some other similar periodical, for the purpose of obtaining all the present literature existing on the subject by the next meeting, which takes place on Friday the 24th inst.

OLD ENGLISH BUILDINGS AND THEIR RESTORATION.

THIS was the title of an interesting paper delivered before the Birmingham Architectural Society last week, by Mr. Allen E. Everitt. In the course of his remarks, Mr. Everitt said, I feel that one of the objects contemplated by the Society—viz., the cultivation of an artistic feeling for, and a true appreciation of, the value of our ancient remains—will be best served by briefly noticing what there is of especial interest near at hand, and also venturing to give an artist's thoughts on their present appearance and future prospects. For this purpose we will take our own town as the centre of a radius extending for about fourteen miles; and first and nearest comes Aston, with its grand old hall and highly interesting church, rich in monumental remains of the last four centuries. Then we have the moated hall of Perry, dating from 1579, the old parish church at Handsworth, with its tower placed at the east end of the south aisle; and the

towers of the old churches at Edgbaston, Harborne, and Moseley, where little else of ancient work remains. The old house at Camp Hill, dated 1601, and the Old Crown, and a few others in Deritend, and a few picturesque bits scattered here and there at the outskirts of the town, but which are fast being displaced by the business requirements of modern days, serve as a lingering relic of the artistic taste of our ancestors; and even St. Martin's Church, although disfigured by a churchwarden's brick great-coat, has still many points of interest, especially in its monuments of the old lords of Birmingham. Looking southwards, at a distance of about five miles, we have King's Norton, which, with its fine church and adjoining picturesque school, of early date, and numerous old gabled houses of Elizabethan and Stuart days, surrounding the village green, forms a most pleasant architectural group, and one that will repay a visit. In its close vicinity lies Northfield, with a church of interesting Early Pointed date, having a massive tower and other curious features; and Cofton Hackett, with its quaint bell turret, and adjoining Hall. The latter, although apparently a modern house, has still remaining a portion of a fine old hall, with open timbered roofs. We also have Barnt Green, where the highly-picturesque, half-timbered mansion, situated at the foot of the Lickey Hills, is well known to travellers on the Midland Railway. In this direction also is Alvechurch, with its old houses, and lately restored church, to be referred to further on; Beoley, with a curious church, containing some early Norman portions, and some admirable Elizabethan tombs, rich in decaying gold and colour; and the little town of Bromsgrove, full of interesting bits, both for the architect and artist. In a south-easterly direction we have Solihull, with a noble old cross church, worthy of attentive study; Knowle, with its Late Pointed church, once collegiate; and Temple Balsall, with its well-known church of the Knights Templar. Tanworth and Lapworth also have interesting features, the latter being especially noticeable for its almost detached tower and spire; and also Packwood and Baddesley Clinton, whose churches (more es pecially the towers) are similar in design, and are traditionally described as having been erected by Nicholas Bourne in the latter part of the fifteenth century; the said Nicholas Bourne being the proprietor of the old moated house at Baddesley Clinton, now remaining in its entirety, and perhaps one of the most interesting mediæval bits in this locality. The old mansion at Packwood, also, must not be omitted, as, although many of its best features are concealed under a coat of roughcast, yet it is a fine example of the half-timbered structures of the Stuart days; and its ancient garden, with the clipped yew trees and formal hedges, is quite unique. In the little town of Henley-in-Arden may be noticed the remains of a picturesque old market cross, and many other bits of the olden time. In an easterly direction we have, first, Yardley, with a spire church, having a chancel of Early Pointed date, and an excellent open timber porch; Sheldon, with a good 15th century tower, and portions of earlier work, lately restored (but which I have not visited since the same has been effected); Sheldon Hall, containing some good internal carving of sixteenth century work; and Castle Bromwich, with its fine hall, rich in old tapestry and quaint carvings, and with a garden laid out with the clipped hedges and trim walks of Dutch William's days, forming a truly charming spot, and one well cared for by the Earl of Bradford, in whose family it has remained for several generations. Then we have Bickenhill, with a spire church, in which are many interesting Norman portions; and Hampton-in-Arden, noticeable for old cottage bits, subjects for no end of pictures, and a church in which are progressive examples of the Norman and later styles of our English architecture. A little further in this direction is Berkswell, whose church has a fine Norman chancel, under which is a good crypt, now used as the burial vault of the Sir Eardley Wilmot family; and Packington, whose park comprises a relic of the once far-famed Forest of Arden, the grand old oaks in which have been immortalised on canvas by our worthy friend, Mr. F. H. Henshawe. In this park is the old house, built by Sir Thomas Fisher towards the end of the 17th century; and I may here mention that nearly all the old farm houses in this part of Warwickshire have been furnished with the protection of a moat, doubtless as a security required by the dense woodland tracts in which they were situate. In this neighbourhood also is Maxstoke, whose Priory ruins, with their close-adjoining village church, are worthy of a most careful investigation; and at a little distance the moated house, or rather Castle of Maxstoke, is the very picture of an old English feudal house. Near at hand, also, is Coleshill, with its restored church and Digby monuments, and other interesting relics of former days, including the pillory, a relic of old customs not often met with. In a north and north-easterly direction is Sutton Coldfield, where the good old Bishop Vesey must not be forgotten; and in its near vicinity is the moated house of New Hall, with embattled towers and quaint old work. There is Pipe Hayes, too, a timber mansion, now roughcast, but singular from having a number of little gablets, and some massive bay windows. Curdworth has a church, with a good Norman chancel arch; and Astley Church and Castle are well worth a summer's day journey. Kingsbury and Polesworth, the latter with its fine Conventional church, are also noticeable; and Tamworth, with its church and castle, the former rich in early monuments of the Ferrers and Neville families, must be well known to all. To the north-west there is not much of interest, the Black Country having gradually absorbed nearly the whole of the picturesque remains. The parish church of Walsall, however, has some chancel stalls of rather good character; and at the edge of the town there is an old seventeenth century house, of moulded brick, called Colmore Hall, worthy of inspection. At West Bromwich the old church of St. Clement has a few bits of good work almost buried under modern plaster; and in the neighbourhood are two old houses of timber construction. The one near the church, called Bromwich Hall, has been greatly altered; but the other, called the Oak House, and situated near Spon-lane, remains in a perfect state, but surrounded with modern houses and smoky chimneys. At Wednesbury, the old church, with its octagonal chancel, was sadly ill-used some thirty-five years since; and the Collegiate Church of Wolverhampton is too well known to be commented on. At Tipton was an old church containing much Early Norman work, some few years since quite in ruins, but I understand it has been rebuilt, but whether ill or well done I am uninformed. The Castle of Dudley is also one of the well-known objects of our neighbourhood; and in the vicinity of Stourbridge are, I believe, many old mansions of the Elizabethan and later periods, which should be carefully examined. To the west of Birmingham is Hales Owen, whose church has perhaps the largest amount of Norman work remaining of any in the neighbourhood, and the ruins of Hales Owen Abbey, close by, and the little chapel of St. Kenelm, on the Clent Hills, have much to render them interesting. The hall and restored church of Hagley, and the picturesque church of Clent, lying close under the shadow of the great hills, will, I think, complete the list of the most noticeable architectural and antiquarian features comprised within what may be called "our neighbourhood." Having thus shown that we have much surrounding us worthy of our care, permit me to say a few words upon "how they are cared for." And I only hope you will kindly bear with me if I give way to a little grumbling, as in all probability an artist sees more beauties in these old decaying places than a more matter-of-fact person; and if a bit of colour "comes out well," and a broken line is "highly picturesque," it is more satisfactory perhaps than the most perfect work. At all events, I can only say that I dread the word "restoration," as applied to an old church or hall. "Preservation" I can understand, where the architect, with an artist's eye and loving care, will save each mouldering stone where practicable, and insert as little as possible of modern work. But "restoration," in many cases where I have seen it, means a wholesale scraping, cleaning, varnishing, and general "doing up;" making the place look uncomfortably clean, but obliterating many beauties and much charm of colour, which, to me, would be a chief attraction. The fact is, I look upon an old church as a silent history, in which have been expressed in wood and stone men's thoughts and actions, through successive generations; and I do say that the wholesale clearing away of all relics of the Elizabethan and Stuart periods from our churches, in order as it is said to restore them to their pristine character, is most reprehensible, for we thus lose many things, which, although perhaps not exactly in accordance with the architecture of the edifice, yet are so expressive of the periods and so good in themselves, both in workmanship and design, that it seems like tearing a page from history to have them removed. In building our new churches, of course it is desirable that the whole should be in unison, but our old church is a chapter in our art history, and as such should be religiously preserved. I have been led into these remarks from having noticed with regret the loss or removal, in late years, of much that was good in many of the places which have been just referred to, and perhaps you will pardon me for taking up your time by mentioning a few instances, for I firmly believe that the present century has seen more ruthless destruction of old things, under the plea of enlargement and rebuilding, than has been accomplished during the past two centuries. The first grumble, therefore, shall be at Knowle, where the old collegiate church has been lately under repair. In this church a fine carved wood screen still remains in the chancel. There, however, were some good stalls in, of course, their usual position to the screen, and these have been removed most injudiciously to the east end of the south aisle, thus depriving them of their original signification as choir stalls, and replacing them by new stalls of poor design and execution, and much inferior in picturesque character to those removed. The next place where the restorer has been busy is Coleshill. I will freely admit that the church was blocked up with unsightly galleries and tall pews, the absence of which no one can regret; but I do regret the loss of a wrought-iron chancel screen, the date about 1700, and although the same may not have been in accordance with its surroundings, yet it was of good workmanship, and a memorial of some worthy churchmen of those days. The altar rails here had also the massive balustrade and broad flat top of the Caroline period, and formed three sides of a square round a carved altar table of that date. These have been removed to give place for a flimsy metal rail, which, though perhaps architecturally correct, has not, to me, one half the charm of the old balustrade, on which the sunlight seemed to fondly linger as it glanced through the chancel windows. In passing through the churchyard at Sutton Coldfield some short time since, a staring new porch first caught the eye, so stained and varnished up that, from its deep brown colour and plate-glass sides, it looked more like some new toy. In all probability it is intended as a restoration of the old one, but the charm of the old one's colour is wanted, and, though possibly of good design and correct execution, it seems harsh and out of place, and, compared with the time-stained walls of the church, resembles a new patch on an old garment. One more example, and I think your patience will be exhausted. This is the restored church at Alvechurch, where but little is left of ancient date: and why the Norman nave arches should have been entirely swept away is very questionable. The new church is most certainly much loftier and of grander proportions, but the old one seemed to me more suited to the locality, and possessed many curious features well worthy of being spared. The church at Bromsgrove has certainly met with greater care, the whole character having been well preserved; and at King's Norton the whole seats, containing much Jacobian carving, have been only judiciously lowered, thus saving many a bit of good art workmanship. I hope the foregoing remarks will not have left the impression on your minds that I am averse to all necessary restoration, as such is far from being the case; my object being only to draw attention to the indiscriminate removal of all objects in our churches of post-Reformation date, which our restorers are so fond of accomplishing, and I think, after a careful examination, it will be found that the deep galleries and heavy pews, windows deprived of their tracery, and such like abominations, are in most cases the work of churchwardenism during the period from 1760 to 1830, when true art in church work was at its lowest ebb; and, as I have before mentioned, I believe that our buildings suffered more then than at any previous time. In order to endeavour to "preserve," not restore, the remains of old art workmanship by which we are surrounded, might I venture to suggest that it is in the province of this society to take these matters under its especial care? And for this purpose could not an archæological branch or section of the society be formed, which, by means of an appeal to those in authority over the different structures entrusted to their care, would so interest them in the structures over which they have control that not a stone would be touched without the previous sanction of the society? And thus much would be preserved that otherwise would be ruthlessly swept away.

We have to remind our readers that the twentieth annual ball in aid of the funds of the Builders' Benevolent Institution will take place at Willis's Rooms on Thursday the 30th inst.

Building Intelligence.

CHURCHES AND CHAPELS.

The small but pretty ancient parish church of St. Mary, Lower Heyford, Oxford, has been reopened for divine service. The five bells have been rehung and the large tenor bell recast by Messrs. Myers and Stainbank, London. Mr. Buckeridge, of Oxford, is the architect, and Messrs. Jos. Castle and Co., of that city, the builders. The cost of the restoration was £1,240.

A general meeting of the Hereford Diocesan Church Building Society was held on Wednesday week. After the reading of the report and transaction of the general business, it was stated that the Lord Bishop had promised to issue a pastoral to his clergy, asking them to have collections in their churches on the ensuing Palm Sunday, to be divided equally between the parent and diocesan church building societies.

The corner stone of Christ Church was laid at Patricroft on Saturday. The plan comprises a nave, with side aisles, and is arranged so that if additional accommodation be required, transepts may be added at a future period. All the roofs are framed of red deal. The church will be faced externally with Peirepoint masonry, with dressings of Hallington stone, and the interior will be finished with brickwork of various colours, and the remainder plastered. There will be accommodation on the ground floor for 532 persons. One half of the seats will be free and unappropriated. The works have been undertaken by Mr. H. Southam, builder, of Salford, for £3,800, under the direction of Mr. J. Lowe, architect, Manchester.

On Tuesday, the Bishop of Lichfield consecrated at Bradley, near Bilston, a new church, dedicated to St. Martin. It is in the geometrical style of architecture, and will seat 850 persons. The plan of the church is cruciform: the length of nave 78ft., and width of nave and aisles 65ft. 6in. The tower and spire, 170ft. high, are at the south-east. The material used for the walling is Gornal stone, in coursed rock-faced ashlar, box-ground stone dressings; the nave, piers, caps, and bases of Hollington stone; the aisles, chancel, and communion are laid with Messrs. Maw's encaustic tiles. The builder is Mr. Nelson, of Dudley, and the architect, Mr. Bidlake, of Wolverhampton; the cost about £6,000.

Baron Triquetti has just completed the first portion of the series of inlaid marble tableaux for the decoration of the interior walls of the Albert Memorial Chapel at Windsor Castle, and they have been erected in the places assigned them within the chapel under the baron's personal supervision, and six in number cover a space of about 633 square feet upon the surface of the walls, the larger panels with their ornamental borders being each about 11ft. 2in. in length and 9ft. 6in. high.

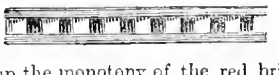
HEADINGLEY, LEEDS.—The consecration of St. Chad's Church at Headingley, Leeds, took place on Saturday by the Bishop of Ripon. The style and character of the church, which has cost about £10,000, is after the Early Fourteenth century, and in massiveness of detail and the geometrical forms of arches and tracery is in character with the Selby and Beverley Minsters. Mr. W. H. Crossland, of Leeds, is the architect, and the work has been executed from designs prepared by that gentleman and partly suggested by Mr. E. B. Denison. The plan comprises a nave of five bays, chancel of one bay, and a five-sided apse under one continuous roof, with aisles running round the apse, forming an ambulatory—the tower being at the west end, and the porch in the north-west bay. The church is seated to accommodate 600 persons, its entire length is 137ft., the width 61ft. 6in., the height to the roof ridge 57ft. The tower is 16ft square within the walls, and is surmounted by a spire, which rises to the height of 186ft. One great feature in the interior of the church is the stone carving, which, although not actually copied from old examples, is studiously after those in the Selby choir arcades and the Percy shrine at Beverley. Mr. Ruddock, of London, has carried out this portion of the work. The pulpit, placed against the north-west pillar of the chancel, is of stone, richly ornamented with Devonshire marble shafts. A stone screen, arcaded and richly carved, divides the chancel from the ambulatory. The font is also of stone, richly carved, and is situated under the tower. Local stone has been used throughout, with the exception of the reredos, pulpit, font, and all foliated capitals, for which a finer stone has been employed. The roofs and seats are of deal, slightly stained; and polished flags have been used for the floors, with the exception of the sacrarium, which is tiled.

BUILDINGS.

A new opera house, built by Mr. Pike, formerly of Cincinnati, is to be opened in New York. It has a frontage of 112ft. in Eighth-avenue, and of 120ft. in Twenty-third-street. The height of the auditorium from floor to ceiling is 70ft., and it has a dome of stained glass 30ft. in diameter; the depth of the stage is 70ft, width 80ft., height 50ft. In the auditorium, which can be easily transformed into a ball-room, 2600 persons can be seated. Exclusive of this house, there are now ten first-class or "west side" theatres in New York, besides several large concert rooms, music-halls, and conservatories.

The old Magdalen Hospital, which has been established very many years in the Blackfriars-road, for the reception of fallen women and the reclaiming of "unfortunates," is about to be removed from its present locality to Streatham, and the committee appointed to make the arrangements for the new institution have secured an eligible site of land, and rapid progress is being made for the erection of the new building.

SIR,—I send you a description of a house now being built for Mr. Wm. Chappell:—Although there is no architectural pretension about the building in question, it is considered a success, inasmuch as it provides considerable comfort, capacity, and thoroughly good and substantial work at small cost, and the most is made of the materials by employing the blue headers (picked out of the ordinary bricks) in bands (not projecting), with a red dog-tooth course between, thus—



to break up the monotony of the red brick; and the stone quoins, springers, sills and door dressings, which are of Chilmark stone, add to the relief. The house is built in the favourite neighbourhood of Ascot, or rather on the high road between Ascot and Bracknell, and contains on the ground floor, drawing-room about 24 × 24, billiard-room 24 × 18, dining-room 23 × 18, library 20 × 16, entrance-hall 8 ft. × 16, and inner hall and staircase 12 ft. wide × 24 ft. long, large conservatory heated with hot water, good servants' staircase, and a complete set of offices, arranged so that they are conveniently separated from the rest of the house, but easily accessible to the serving door of the dining-room. The basement contains the dairy larders, some beer and coal cellars, knife and shoe places, &c. The first floor consists of large and small bedrooms and dressing-rooms, bath-room, water-closet, &c., and a complete set of servants' rooms communicating directly with their staircase. The billiard-room, dining-room, hall staircase, and library, are all fitted up with pitch pine, and all the sashes, except the servants' department, are glazed with polished plate glass. Mr. James Pether, builder, of Sunninghill, has taken the contract for £2550, and so far has carried it out well, more particularly the joinery, which is not to be surpassed for the quality of the wood. One rather good feature of the design is the fire-places (and their chimneys add to the external effect), which are all arranged in the internal walls, so that none of the heat is lost to the house, which latter is a great desideratum in the country. The architect is Mr. Alfred Smith, of the Adelphi.—I am, &c., JAMES SKRINE, Clerk of Works, pro R. B.

Ascot, Berks, Jan. 10.

On Tuesday, the new national schools at Shirley were opened. They have been built at a cost of upwards of 2,000, the area occupied, including yards, playgrounds, &c., being about an acre in extent. The schools have been built by Mr. George Inder, under the management and inspection of Mr. Rowed, agent to Mr. Jeffreys, and present an elevation of red brick, having gable ends, finished with ornamental barge boards.

Several thousand pounds have already been raised towards the purchase of land for the erection of buildings for an infirmary and dispensary at Burton-on Trent. A site has been secured, and the building committee have selected the design of Mr. Edward Holmes, which was submitted in limited competition. The works are to be commenced forthwith.

St. Philip's Infant School, Alderley, was completed and opened last week. The school is 40ft. by 20ft., with two class rooms, library, &c. The roofs are open, the windows glazed with geometrical quarries. The works have been executed by Messrs. Royle and Meller, builders, Wilmslow, from the designs of Mr. John Lowe, Architect, Manchester.

DUBLIN.—A new masonic hall and club-house is now being erected on the north site of Molesworth-street. The front elevation (Italian style) is divided into three styles; the lower one is of the Doric order, the centre of the Ionic, and the upper of the Corinthian. It has been executed in Ancaster stone. The whole is surmounted by a pediment (the entire width of front), in the centre of which are the masonic emblems. The height of the building from ground line to top of pediment is about 73ft. The design is by Mr. Edward Holmes, of Birmingham and London, and was selected in a competition in the early part of 1866. Mr. Meade, of Great Brunswick-street, is the contractor. The cost will be about £8,000.

WATER SUPPLY AND SANITARY MATTERS.

The government of India has called upon the local governments for information to be obtained from the Executive Engineers of the Public Works Department, as to the most simple and practical method of purifying water supplied to troops. Objections, it appears, have been raised to the present systems of using earthen vessels, and filter stands.

During the past week nothing fresh has transpired with respect to the sequestration of Tunbridge Wells. It is the intention of Mr. Julian Goldsmid, M.P., to oppose the carrying into effect of the northern portion of the drainage scheme. It will, however, be for the Home Secretary to decide whether Mr. Goldsmid shall have the matter all his own way.

On Tuesday Mr. Rawlinson, C.B., Mr. J. T. Harrison, and Professor Way, Her Majesty's Commissioners appointed to inquire into the best means of preventing the pollution of rivers, commenced their investigation into the condition of the basins of the Mersey and the Ribble by holding a public meeting at St. George's Hall, Liverpool. The heads of inquiry, which is to be extended to the river Dee as well, are:—1. Pollution by town sewage. 2. Pollution by refuse from manufactories. 3. Pollution by refuse from mines. 4. Obstructions by solid refuse and manufactories. 5. Nature and extent of manufactories carried on upon the banks of the said rivers. 6. Cause and extent of flooding upon adjacent lands. 7. The general state of the water supply. The inquiry, which was continued on Wednesday, was unexpectedly brought to an abrupt termination. Mr. Rawlinson considered that some questions asked by Mr. Harrison on the local sewage were not warranted, and tended to exhibit ignorance; and therefore stated that he should not sit again with him, but would write at once to the Home Secretary, and explain matters, as he would rather resign than sit again with Mr. Harrison. Mr. Rawlinson's remarks created a most painful sensation in the court, and the general opinion of all present was that he should have expressed himself as he had done to Mr. Harrison in private.

A Belgravian thinks that "the dispute relative to Park-lane between the Office of Works, the Metropolitan Board, and the Vestry of St. George's, Hanover Square, is a very pretty quarrel among themselves, for which the public, as usual, have to suffer, and must grin and bear the inconvenience till it suits the dignity of these three boards to allow the work to be proceeded with. But this delay in Park-lane is no reason why the railings in Knightsbridge, from Hyde Park-corner towards Wilton-place, should not be restored. There is no widening in the road or footpath to be made; in fact there is nothing whatever to be done, except to put up the rails for the distance of about 200 yards at the utmost, and yet since July, 1866, not an attempt has been made to restore this side of the park to its original state. It really is time to inquire how long this shameful negligence is to continue, and to bring before the public, through the medium of the redresser of all just grievances, the idleness of the Office of Works in thus neglecting their duty."

TO CORRESPONDENTS.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—S. E.—C. W. L.—R. D. and Co.—I. C.—G. L. A.—G. R.—I. R.—R. E.—B. W. W.—E. W. P.—E. M. N.—G. W.—I. P.—B. L. B.—H. A.—A. G. H.—C. L. E.—T. G.—T. C.—E. R. F. B. and F. T.—I. G.—H. A. G.—F. R. P.—W. H. B.—B. J. T.—D. L.—W. T. B., Send the Photos.

Correspondence.

THE LAW COURTS.

To the Editor of the BUILDING NEWS.

SIR,—I read last week in one of the daily papers an article giving an easy solution of the difficulty found in selecting an architect for the Law Courts. The proposition was that Mr. Street should do the front of the building, Mr. Scott one side, Mr. Waterhouse the other, and Mr. Burges the back, Mr. Barry having a general superintendence of the whole. The author of the article in question thought that, by employing varied talent, we should have great diversity in the architecture. We certainly should. I do not think he goes quite far enough. Mr. Abraham had a prominent place given to him at Lincoln's Inn, so should have something to do with it. Why not give him the foundations?

Mr. Seddon might look after the carving to see that no "importations from the squire's hothouse are introduced." He would no doubt give us instead some ferocious-looking lions, a pelican feeding its young, &c. A lawyer eating the oyster and giving the shells to his clients would do well for the principal entrance, and we might expect good treatment of such a subject from one so learned in oyster-culture. Professor Kerr might introduce a little of that "refinement which is characteristic of our neighbours' buildings across the channel." Mr J. Papworth might be there to see that the art workman does not misconduct himself. Mr. B. Keeling would soon make amends for any want of notching in the back elevation. Mr. B. Hope takes great interest in the success of the building; it would be only fair to let him manage the sky line, on condition that he would not object to Messrs. Banks and Barry introducing some of their unique terminals.

By adopting this course, we should unquestionably introduce "varied talent," and "produce a building worthy of the nation." Irrespective of that, Sir, only think what a treat there would be in store for the Architectural Association to be pioneered over by Messrs. S., S., B., B., &c., on its completion, and how it would augment the number of members of that useful institution. It would also give cause, twenty years hence, for the sons of the several gentlemen employed to render their rival claims as to "Who was the architect of the Law Courts?"—I am, &c.,

Jan. 13, 1868. J. S

WALL DECORATION.—LEEDS FINE ART EXHIBITION.

SIR,—A short time ago, passing through Leeds, I was induced to visit the New Infirmary to see "the decorations" now being carried out under the direction of the Committee for the Fine Art Exhibition soon to be held within its walls. If these so-called decorations are to be taken as a criterion of the state of art in this the metropolis of the West Riding of Yorkshire, the School of Design has not been established there a moment too soon, and its fruits must still be in embryo. In wall decoration precision is a most essential quality, and that stencilling should not appear stencilling is, I think, universally acknowledged. In this instance, shapeless gaps and rents of all imaginable widths, not joined by hand as good work ought to be, whilst it is applied to a ground of plaster wholly or very inadequately prepared, on which large maps or stains are painfully visible; panels with rails and stiles of varying widths; moulding lines not parallel; lines of intersection meeting at different levels, wavy where they should have been straight; and an entire disregard to harmony and contrast of colours, do indeed show as if some "prentice hand" had made its first and wholly unsuccessful essay. One must devoutly hope that hereafter no nervous patient having a correct eye may be confined to these wards, as I fear his recovery would be hopeless.—I am, &c. W.

Intercommunication.

QUESTIONS.

[711.]—UNDERGROUND TANK.—I beg to thank "Veritas" for his prompt reply to question 688, in the BUILDING NEWS of November 29 last. The plan which he recommends cannot be adopted, as the tank is in the middle of the house and is partly built upon and floored over, so that no external remedy can be applied. May I, therefore, ask him, or any one else who can oblige, to inform me of any effectual remedy which can be applied to the inside of the walls and bottom.—TANK.

[712.]—MARBLE STAINS.—Can any of your correspondents inform us the best method for removing shopworn stains from white vein or Sicilian marble without injury to the marble?—We are, &c., J. and E. G., Phœnix Steam Marble Works, Stonehouse, Plymouth.

[713.]—ASHPITS.—I have a quantity of ashpits to cover with doors and frames; the contents are very powerful. As I cannot ventilate the same, will any friendly correspondent give me an opinion whether wood or iron would be the best for the purpose? I am afraid the strong ammonia would destroy the iron. The pits are level with the ground.—J. M., Nottingham.

[714.]—ROOF CONSTRUCTION.—I will thank you to lay before your readers a difficulty which has occurred to me in the construction of the roof of a small church, the nave of which is 28ft. and the transepts 22ft. span. I wish to have the ridge of both in the same plane, and I should thank anyone who has erected such a roof to say how the principals should intersect at the top or how they can be securely tied without a formidable apparatus of ironwork. I also beg to be informed, what the minimum of scantling may be for rafter purlins when the trusses are 6ft. apart, the rafters or purlins being at 3ft. centres, and the pitch of roof being about 40 deg.—INQUIRER.

[715.]—ROYAL ARMS.—Can any of your readers inform me whether a builder incurs any penalty or liability by heading his card or advertisement with the Royal Arms, not having previously patented the article he advertises? I have just had cards printed, and merely added them for ornament, and am now told I dare not distribute them.—F. K.

REPLIES.

[707.]—MILDEW IN ROOMS.—If not of too long standing, mildew in rooms may be destroyed by washing the places affected with a weak solution of hypochlorate of lime. This almost always succeeds, and is, at any rate, worth trying.—A. S.

[708.]—GOOD GOTHIC.—Rickman, in describing the style to which he gives the name "Decorated," especially classes under that style the tracery in "the figures, such as circles, trefoils, quatrefoils, &c., which are all worked with the same moulding, and do not always regularly join each other, but touch only at points; this, he said, may be called geometrical tracery." It has been described as, perhaps, the most perfect of all the styles, "for its tracery has the completeness and precision of the Perpendicular, without its licence and exuberance; while its minor details partake of the boldness and sharpness of the Early English, which need not fear to be compared with the ornamental accessories of any subsequent style. Besides the intrinsic beauty of this style, it is important as affording the first full development of tracery and of casting, with all their power of enriching large windows, and of bringing together several lights as one whole."

[709.]—ROOFS FOR WORKSHOPS, SHEDS, &c.—The following information will answer some of the inquiries which are frequently made as to zinc roofing:—

1. Sheet zinc is always attainable in sheets 8ft., and 7ft. by 3ft., and 2ft. 8in., but it may be rolled of any length under 12ft. For especially rolled sheets, about a month's notice should be given, and for lengths over 10ft. an additional cost of about £2 per ton is incurred for rolling.

2. The sheets may be laid in three ways, viz., on boards, or corrugated with horizontal supports every 2ft., without boards, or in what is called Italian-formed zinc, in which a corrugation occurs every 10in., 1ft., or 1ft. 3in., and the corrugation lies upon a light rafter or bearer running lengthwise; in the two latter instances no boards are required, and the Italian forms an excellent roof, and one that looks also exceedingly well.

3. The strength allowed in large roofs for wind and snow will be always sufficient, without adding anything for the zinc covering.

4. The thicknesses to be used should be on boards not less than No. 14 gauge, weighing 21oz. 13drs. to the superficial foot,, and without boards not less than No. 15, weighing 24oz., or No. 16, weighing 26oz. 5drs. to the superficial foot. The zinc in common use, till within the last few years, and not by any means abandoned yet, is No. 9, weighing 10 oz. 13 drs. the superficial foot, which will not answer even if well laid, but laid in the ordinary way is sure to tear itself to pieces and to fail.

5. The metal should be laid so that each sheet is quite free to expand and contract. If engineers and architects will specify the gauge and weight per foot of the sheets they desire to use, and will add that it is all to be laid "quite free and unconfined, without soldering any joints," they will probably receive proper material and workmanship. Short-sighted workmen will of course object, if they can, to do the work in a way that they are not fully used to do, but it is quite certain a neglect of the precautions above-named will cause the work to fail.

6. In flat roofs, if possible, a fall of 6in. in the ordinary length of a sheet should be obtained, and drips should be 2½in. deep, to allow the rolls to pass well under the projecting upper sheet, with its rounded edge. The carpenter will do well to give the zinc-worker notice before he forms his roof, so that these matters may be pointed out.

7. No nail should ever pass through the outer surface of the sheets or roll caps; none is needed; and no system of washers will do—nothing but a cap soldered quite over the nail head, which is too troublesome and expensive ever to be done as a regular thing.

8. The price of sheet zinc varies with the price of spelter; it has ranged, during the last few years, from £21 to £28 a ton; £26 is an average price, and at this price zinc roofs, of a plain character, may be laid as follows, at per superficial foot:—No. 14 at 3d., on boards; No. 15, on boards or Italian, at 7½d.; No. 16 at 8½d.; but these prices are not measuring all the zinc used, but stretching a line from ridge to eaves, and from side to side, girting nothing, and adding nothing for rolls, caps, welts, &c.; thus, anyone, however in experienced, may, by so easy a measurement as this, obtain an estimate of the finished roof he wishes to put up. Flashings and gutters are to be added to the above.

9. If the roof has a fall of 12in. and upwards in the length of a sheet, no drip is required, only a fold at the junction of the sheets.

10. Lime destroys zinc; it will be well, therefore, that flashings should be pointed in cement.

11. The relaxing effect of a hot sun must be guarded against when the metal has no boards or other support beneath it; in such cases, No. 15, or higher gauges, should be used; eaves-gutters should be stayed across every 1ft. 6in.; they will do best if allowed to rest on a sailing course, on on the member of a cement cornice, and the underlap in roofing done on the system used at Victoria Station; must have a good hold on the rafter, and may be nailed with nails in large oval holes, so as to permit expansion lengthwise.—R. G. F.

STAINED GLASS.

A stained glass memorial window was recently fixed in the Catholic church of St. Mary, Kentish-town, executed by Mr. A. J. Mingaye, of London. The subjects are, The Raising of the Widow's Son and the Raising of Lazarus. The window is in memory of Mr. Edmund Kelly, architect, contributed by his mother. The chancel of the church was lately decorated by the same artist.

A three-light stained glass window has been inserted in the north chancel of Hereford Cathedral, to the memory of Captain Arkwright, who was lost in an avalanche on Mont Blanc. The subjects are St. Michael Subduing the Devil, David Slaying Goliath, the Appearance of the Angel to Cornelius, the Burial of Saul, and St. John Commanding the Soldiers to "Do Violence to no Man." The window is from the firm of Wales and Co., of Newcastle-on-Tyne.

STATUES, MEMORIALS, ETC.

The Pope is erecting at Monte Rotondo a monument to the Pontifical soldiers killed in that town and at Mentana, and has entrusted the work to Count Vespignani, one of the best architects in Rome.

The Plymouth Rock monument was completed on December 7, but the dedication will not take place until some time in the summer of 1868. In a leaden box, placed between the copestone and the dome, the bones of three of the pilgrims are deposited.

LEGAL INTELLIGENCE.

BUILDING SOCIETIES, LEASES.—An action for rent, Cruikshank and others *v.* Lefevre, was heard last week at the Bow County Court. The plaintiffs are trustees of the Temperance Benefit Building Society, and the defendant is lessee of premises of which the trustees and mortagees are in possession, and, the lease granted to the defendant being unstamped, the question was whether a stamp was requisite to make the lease admissable in evidence. The learned advocate for the society submitted that the lease was admissable, inasmuch as the provisions of the Friendly Societies' Act (10 Geo. 4, cap. 56) were, so far as applicable, extended to Building Societies by statute 6 and 7 Wm. 4, cap. 32; and section 37 of the Friendly Societies' Act provides that—"no bond or other security, nor any other instrument, or form of assurance, or document given in pursuance of the Act, shall be subject to any stamp duty whatsoever." He also cited various cases, to show that leases as well as mortages and other securities of Building Societies, are exempt from stamp duty. For the defendant, it was contended that, as the costs of a lease are paid by the lessee, it was not any benefit to the Society to have it granted free of stamp duty, and detrimental to the revenue, the interests of which the Court was bound to take judicial notice of. His Honour, having taken time to consider the question, said that "very much against his own inclination, he felt bound to follow the decisions of the Superior Courts cited, and to give judgment for the plaintiffs."

PIRATED PHOTOGRAPHS.—At the Birmingham police-court last week, Mr. Robson, wholesale photographer, Birmingham, was summoned by Messrs. Graves, of London, for selling pirated copies of registered photographs, of which the complainants were the owners. The complainant,

having reason to suspect that pirated copies of their property were being disposed of in a wholesale manner, sent a young man, named Catamole, in their employ, to Birmingham in June last. Catamole assumed the name of Milner and applied to Mr. Oldham, of the firm of Oldham and Cooper, photographers, New-street, Birmingham, to introduce him to some parties from whom he could buy photographs. Catamole professed to have been recommended to Mr. Oldham by a gentleman well known to the latter, who introduced Robson to him. At two different times photographs of "A piper and two nutcrackers," "The acquittal," "The first sermon," "The second sermon," and "Waiting for the verdict," all of which are the copyright of Messrs. Graves, were bought by Catamole from Robson for the sum of £8. The bench fined the defendant £5 each in thirteen cases, making a total fine of £65 and costs, or twenty-six months, imprisonment. The prosecution withdrew their claim for costs.

COMPENSATION.

Mr. Alderman Bennett, ironfounder, has obtained in arbitration, the sum of £1,900 as compensation for loss, damage, and inconvenience, in consequence of the Corporation of Liverpool requiring a portion of his premises in St. Thomas's-buildings for the purpose of town improvements. Mr. Bennett's original claim was about £10,000. The Corporation offered the claimant land of a more valuable character than that he possessed, in exchange for the portion which they required for the new street, and he now sought to be recouped the amount of expenses incurred by the removal of his premises to a new site. Mr. Isaac Holder, architect and surveyor of Manchester, was called. He estimated the cost of removal at £2807. John Mullin, builder, of Liverpool, estimated the cost, according to one plan which had been prepared, at £2823, and, according to a second scheme, which involved building upon a larger area, at £5505. Mr. Dagleish, mechanical engineer and ironfounder, of St. Helen's, estimated the cost of re-adapting the machinery, and of new premises at £1840. Five months would be occupied in making the required changes, and he thought that six months' loss of profit would result therefrom. It transpired that the net profits on Mr. Bennett's business were between £9000 and £10,000 a year.

Our Office Table.

The "Illustrated London News" gives in its last number "a sketch in Leicester Square," and appends a few facts connected with the history of this standing disgrace to the metropolis. The statue in the centre of the square has a strange eventful history, and seems to have "a divided duty." It is agreed that it was brought from Canons, the seat of the Duke of Buckingham and Chandos, which was dismantled in 1747. By some, Van Nort is said to have been the sculptor; by others, Buchard. Mr. Saarsfield Taylor, in his work on the Fine Arts, considers this statue superior to that of Charles I. at Charing Cross. There seems, however, considerable doubt as to the personage represented. Horace Walpole and his editor, Dalloway, say it is George I.; so do Mr. Taylor and Mr. John Thomas Smith. Mr. Cunningham describes it as George II., and Mr. Cowper in Parliament has more than once referred to it as representing that monarch.

The Belgian Academy of Sciences, Arts, and Literature has offered prizes of a thousand francs each for the year 1868:—First: An historical account of medal engraving in Belgium from the sixteenth century to the year 1794, embracing all the country at present belonging to Belgium, and including the biography of the artists as well as a criticism on their works. Second: An inquiry respecting the period at which the architecture in the Low Countries was affected by Italian influence, with indications of the persons to which such influence is attributable, and citations of works in illustration of the same.

At a meeting of the Exeter Albert Memorial Museum Committee on Wednesday, the tender of Mr. Rowe, South-street, for the construction of the wrought-iron entrance-gates and railings was accepted—the sum being £52. The design for the gates and railing is by Mr. John Hayward, architect.

The Royal Academicians will meet on Friday the 31st inst. for the election of two Associates and one Associate-Engraver.

Alexis Soyer's late secretary writes that the magnificent monument erected by the immortal "Chef" at Kensal-green Cemetery, to the memory of his talented wife, and under which he himself is interred, built at a cost of over £1,000, is from neglect rapidly falling into decay, and unless it is speedily repaired and renovated its entire destruction by the hand of time will soon be effected. An appeal is made for assistance to restore the resting place, and a committee is now being formed to carry out this object, with Mr Alfred Noel, 39, Oxford street, as hon. treasurer.

Some very interesting mural pictures, probably executed in distemper, have been discovered in the Church of S. Pierre-de-Chemillé. These comprise an Apocalyptic subject, the Redemption by the Saviour, the Evangelistic Emblems, the Crowned Elders, Rivers of Paradise, the Mystic Lamb, &c.

A large body of men have suddenly been thrown out of work by the abrupt discontinuance of the works at the Regent's-park lake, which have been carried on with the view of lessening the depth of the lake. On Saturday last the men were paid off without any apparent motive. The reason for the course adopted is still kept a mystery, the only one hinted at being that Lord John Manners, the First Commissioner of Works, has left town and omitted to give the instructions absolutely necessary for the continuance of the works.

The members of the Institution of Civil Engineers assembled on Tuesday evening at their rooms in Great George-street, Westminster, to hear the inaugural address of the new president, Mr. Charles Hutton Gregory. There was a very numerous attendance. The address referred principally to the application of engineering to the purposes of national defence.

For some time past several persons have been actively engaged in Guildford and other places within the county of Surrey, in endeavouring to palm off upon the uninitiated a number of spurious articles, which they allege to be of the highest archæological importance, and in every instance to have been dug up in the neighbourhood of the place visited.

Tunbridge Wells is now under sequestration, issued by Mr. Julian Goldsmid, M.P., who complains that the Improvement Commissioners have polluted a stream running though his estate at Summerhill.

The Paris correspondent of the "Morning Post" says that a new system of lighting the streets of Paris has been tried, with the most signal success. The light produced is described as of the purest white, like that of moonbeams. It allows one to read a newspaper at 25 paces from the projector, and admits of the most delicate shades being distinguished. The discovery was made by a chemist *preparateur*, who had no idea whatsoever of inventing anything new as to the lighting of cities. He was merely experimentalizing, with the hope of discovering some means of taking photographs at night. He, however, hit upon a new and magnificent light, which will evidently replace gas with great advantage, not only in an economical point of view, but likewise in quality and quantity of light obtained. So intense is the glare produced that it will probably be difficult to modify it sufficiently for use in theatres or in private dwellings, the more so as one of the shareholders confided to me the fact that *rouge*, *poudre de riz*, sepia tints laid on eyebrows, and every species of facial adornment, are made painfully visible. The combustion of ordinary gas by oxygen is the principal secret of the process. A small cylinder of magnesium interposed in the centre of a jet in combustion becomes luminous, and produces a quantity of light measured at sixty times that which would be produced by ordinary gas, and at less than one-sixth of the cost.

Petroleum oil has been used for fuel in a steam fire-engine in Boston, U. S. The occurring of an extensive conflagration afforded a practical test. In three minutes, or while the machine was being drawn to the fire, steam was raised to a pressure of 100lbs. Other fuel clogs the exhaust pipes of steam fire-engines, but petroleum does not. This was shown at the Boston fire, the engine gaining thirty per cent. of water pressure in excess of any other machine on the ground. There was little or no smoke from the funnel.

A very painful misgiving, writes a correspondent, has arisen recently with regard to the condition of the water glass frescoes in the Palace of Westminster. Indications have become perceptible, it is said, of an excrescence of the fungus type on the surface of more than one of the most remarkable works in that unequalled but unlucky edifice.

The adjourned conference of Birmingham manufacturers, held under the auspices of the Birmingham Chamber of Commerce, on technical education, was held on Friday. Mr. George Dixon, M.P., presided. Mr. Samuelson, M.P., explained the object of the mission that he had undertaken at the request of the Government. The entire money assistance given by Government to science schools was £5,874, not including cost of inspection, &c. The School of Mines in Jermyn-street had more than £7,000, and the South Kensington Museum £67,000. He thought the aids to Science Schools very inadequate. Every child should be taught geography, something of physics and drawing, and the Government should grant money according to results. After considerable discussion, the following resolution was carried:—"That the council be instructed to request the Associated Chambers of Commerce to inform Lord Robert Montagu that, in the opinion of the chamber, it is of the utmost importance that Government Schools of Science should be established in the great centres of industry, for the purpose of giving technical instruction both to the middle and working classes."

At the monthly ballot of the Institution of Civil Engineers, the following candidates were balloted for and duly elected:—As member—David Phillips; and as associates—Thomas Philip Sherrard Crosthwait, William Cooke Faber, George Farren, Major James George Roche Forlong, R.E., Thomas Ellis Owen, Middleton Rayne, Henry Yarker Richardson, Jagannath Sedasewjee, James Stewart, Captain Hector Tulloch, R.E., and Charles Wawn.

Our readers will be glad to hear that after much agitation and many appeals it is decided to establish a new national museum in the East of London. The chief thing exhibited at this museum will be food in all its ramifications.

The parochial authorities of St. Pancras are about to invite four or five well known architects to send in competition designs for a new district school for about 900 children. The building will cost about £40,000.

The Metropolitan Board of Works has paid £7,500 into court as purchase money for the Heralds' College, with the intention of pulling it down in order to form the new street from Blackfriars to the Mansion House.

The Board of Guardians for the Prestwich Union have elected Messrs R. Neill and Sons the contractors for the building of the new workhouse, which is intended to be a model of such houses for the destitute. The work will cost fron £25,000 to £30,000.

The Health Committee of the Liverpool Town Council passed the following resolution on the question of labourers' dwellings:—That the council be recommended to give the sum of £100 to Messrs. Redman and Hesketh for the plans of labourers' dwellings signed by them, in consideration of their making complete working drawings of them and supplying specifications to the satisfaction of the committee; and that the council erect labourers' dwellings in accordance with such plans on the site between Ashfield-street and Sylvester-street.

Mr. Joseph Glass, the inventor of the chimney-sweeping machine now in use, died at Buxton on the 29th of December. Mr. Glass received the silver medal and the prize of £200, but he never patented his useful invention.

The annual meeting and exhibition of the Darlington School of Art took place in the Mechanics' Hall last week. The students' drawings and a large collection of photographs of enamels, crystals, and porcelain, drawings by Raphael, and other works of art from the South Kensington Museum, were exhibited and greatly admired. The annual report, which was read by the secretary, Mr. J. C. Janson, stated that the institution had been fortunate in its financial results, and that the examinations last year were very satisfactory—the total number of students in 1865 was 144; in 1866, 185 and in 1867, 161.

MEETINGS FOR THE WEEK.

MON.—Royal Institute of British Architects. At the ordinary General Meeting a paper on the "Architecture of Moscow," by Mr. E. l'Anson.

TUES.—Institute of Civil Engineers. Renewed discussion upon the papers on the "Victoria Bridge," and on "The railways at Battersea, &c." S.

WED.—Geological Society, 8.

SAT.—Associated Arts Institute. Exhibition of sketches; subject—"The Lotos eaters." Tennyson.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

1453. J. SADLER. AN IMPROVED NAIL-CUTTING MACHINE. Dated May 16, 1867.

This invention consists in the application of a shaft rotating at one half the speed the main shaft of the machine rotates at, which main shaft gives motion to the cutting blade by means of a crank and lever. Upon the slower rotating shaft the inventor places an excentric, from which excentric, by means of a band and rod, he communicates an oscillating motion to a lever fixed upon a vertical shaft; to this lever he connects a guide which moves the nail plate from side to side of the cutting blade, from which plate the blank for the nail is cut. From this lever he also carries a rod to another lever of somewhat similar construction to the last, communicating an oscillating motion to this second lever, which carries the plate from which the nail blank is made. This second lever is constructed with means of regulating the angle at which the nail plate is required to be to the face of the cutting blade at the moment the nail blank is cut off, so that the blank may be of the proper size and shape requisite for the nail. And the nature of the invention further consists in the employment of two nippers operating each in combination with one pair of holding dies. He communicates motion to these by tappets upon the slower rotating shaft referred to above, or upon another shaft rotating at one-half the speed of the main shaft used for giving motion to the cutting blade. And the nature of the invention further consists in the combination of a shaft (rotating at half the speed of the shaft referred to in this specification as the main shaft) with two tappets upon it, each acting upon separate levers; the oscillating motion thus given to the levers moves forward the heading bolts which head the nails. PATENT ABANDONED.

1464. W. R. LAKE. IMPROVEMENTS IN THE MANUFACTURE OF WHITE LEAD. (A communication.) Dated May 17, 1867.

Sulphate of lead and carbonate of baryta, in the proportion of 100 parts of weight of carbonate of baryta to every 152 parts of sulphate of lead, are placed in a vessel, to which is added water, the mixture being stirred until it is all reduced to a thin paste. After it has been well combined by thorough stirring, the said mixture is heated for three or four hours to a temperature of about 160 deg. Fah., though this temperature may be considerably reduced, or may be raised to nearly the boiling point, without materially affecting the result. The stirring is continued during this part of the process. This treatment will cause the following interchange of elements to take place, namely, the sulpburic acid of the sulphate of lead combined with the baryta, forming sulphate of baryta, and thus liberating carbonic acid, which unites with the lead, forming carbonate of lead. This is then dried in the ordinary way.—PATENT COMPLETED.

1465. W. R. LAKE. AN IMPROVED MODE OF PRODUCING CHLORIDE OR OXY-CHLORIDE OF LEAD, AND TREATING THE SAME FOR MANUFACTURING WHITE LEAD. (A communication.) Dated May 17, 1867.

This invention consists, first, in the treatment of oxide of lead with the chloride of sodium, or its equivalent, substantially as described, for producing a superior chloride or oxy-chloride of lead. Second, in the production of a chlorosulphate or white lead from a chloride or oxy chloride of lead for the purpose, substantially as described. Third, in the production of a carbonate of lead from a chloride or oxy chloride of lead for the purpose, substantially as described.—PATENT COMPLETED.

1476. B. SHEIL. IMPROVED PAVING FOR ROADS AND WAYS. Dated May 18, 1867.

This invention consists in cementing together small stones into slabs, iron or wooden frames or moulds being employed for the purpose. PATENT ABANDONED.

1480. J. SMITH AND J. L. IBBOTSON. IMPROVEMENTS IN RAISING AND LOWERING REVOLVING SHUTTERS. Dated May 18, 1867.

This invention consists in the use of a crank handle, whereby motion is given to toothed wheels, causing a drum or pulley to revolve. Round the said drum or pulley and over a similar one at the top of the window, is drawn tightly a steel bolt or band. The top pulley or drum is attached to a roller on which the shutter is coiled when wound up. A pawl works in the teeth of the toothed wheels, by which means the shutter can be stopped at any point. The said pawl is fitted with a handle, by pulling which the toothed wheels are released, and the weight of the shutters causes them to descend. To ease the dead drag on the rollers, and to cause the shutters to coil up more smoothly, a small friction roller is so fitted behind the shutter that it will pass over it on to the main roller. Instead of a friction roller, two loose pulleys may be employed, one at each end, which will serve the same purpose. PATENT ABANDONED.

1510. J. HARGREAVES AND T. ROBINSON. IMPROVEMENTS IN THE MANUFACTURE OF STEEL AND SOFT IRON FROM CAST IRON. Dated May 22, 1867.

This invention consists in the use of any of the salts which yield oxygen on the application of heat, such as the nitrates, chlorates, chromates, manganates, and stannates, mixed or in combination with any of the oxides of iron or manganese, or any other suitable powdery or granular substance, as agents to act on fused or molten cast iron, to burn out therefrom at any desired speed the excess of carbon in, and at the same time to remove other impurities from the said cast iron, and thereby convert it at one operation into steel or soft iron.—PATENT COMPLETED.

Trade News.

TENDERS.

ASCOT.—For a house, offices, and conservatory, near Ascot, for Mr. Wm. Chappell. Mr Alfred Smith, architect:—

Longmire and Burge	£2,983 0
Robert Lawrence	2,877 10
Joseph Norris	2,718 0
James Pither (accepted)	2,550 0

BRIGHTON.—For alterations and additions to Sylvan Lodge, Brighton. Mr. T. Simpson, architect. Quantities supplied:—

Jackson and Shaw, London	£4,310
Nightingale, London	4,269
Auscombe and Newnham, Brighton	4,195
Bruton, Brighton	4,147
Cheesman and Co., Brighton	3,800
Steddy, London	3,700
Chappell, Steyning	3,687
Sawyer, Dulwich	3,650
Farr, Brighton	3,460

BIRCHETT'S-GREEN (NEAR MAIDENHEAD).—For villa residence for Mr. A. Lawrence, Great Marlow. Mr. Charles Carter, architect:—

Silver	£1 990 0
Revel	1,950 0
Woodbridge	1,929 10
Matthews	1,797 0
Simmonds	1,637 0
Allaway	1,650 6
Colby	1,449 15
Smith	1,258 0

CITY.—For new buildings, Idol-lane and St. Dunstan's-alley, Great Tower-street, for Messrs. Smith, Hanson and Crosfield. Messrs John Young and Son, architects:—

Jackson and Shaw	£9,500
Mansfield and Price	9,308
Browne and Robinson	9,124
Henshaw	9,050
Ashby and Horner	8,840
Conder	8,475

WEST COWES (ISLE OF WIGHT).—For the erection of a villa residence at West Cowes, Isle of Wight, for Mrs. Venning. Mr. Francis Newman, architect. Quantities supplied:—

Chinchen	£1,474 0 0
Wheeler	1,464 0 0
Cooper and Dyer	1,450 10 9
Sibley	1,427 0 0
Denham	1,399 0 0
Thomas	1,379 0 0
Barton	1,360 0 0
Ball (accepted)	1,348 0 0

LONDON.—For alterations to 100, St. John-street road, for supplementary workhouse for Guardians of the Poor, Clerkenwell. Mr. W. P. Griffith, architect:—

Starkie	£455 10
Fricker	345 0
Smith and Sons	340 0
Brett	310 0
Perkins	305 0
Sharman	300 0
Richards	295 0
Grover	293 0
Sawyer	290 0
Dore	284 8
Terry	275 0
Greenwood	270 0
Allard	268 0
Porter (accepted)	249 0
Poole	240 0

LEYTONSTONE.—For Leyton-tone Main Drainage. Mr. John T. Brassey, surveyor to the Committee:—

	Contract No. 1.	Contract No. 2.
J. Porter	£4,3..0	£3,759
P. Pound	4,070	—
H. Bellamy	3,800	3,300
P. Porter	3,750	—

H. Beard	3,636	3,179
Adamson and Taylor	3,607	3,144
Wood	3,600	2,980
J. Nicholson	3,570	3,120
Munday and Hutchinson	3,550	3,150
H. Potter	3,487	3,100
Kent	3,440	2,980
R. Hubbard	3,347	2,939
Williamson	3,300	2,800
J. Bloomfield	3,253	2,786
Wainwright	3 200	2,700
Thackrah	3,100	2,650
J. Smith	2,785	—
Brewer and Steggles	2,977	2,515
Harris	2,975	—
Dickenson and Oliver	2,960	2,570
Knight and Son	2 893	—
Tinsley	2,824	2,510
Moxon	2,800	2,450
Jackson	2,790	—

RYDE.—For the erection of an assembly room, &c., at the Townhall, Ryde, for the Ryde Commissioners. Mr. Francis Newman, architect. Quantities supplied:—

Meader	£3,000 0 0
W Newman	2 989 0 0
Ball	2,900 13 4
Lee	2,777 0 0
Langdon	2,750 0 0
Barton	2,720 0 0
Denham	2,711 0 0
Parsons and Saunders (accepted)	2,490 0 0

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Charles Nicholas Fisher, Keeton's road, Bermondsey, builder, January 28, at 11—Edward Fitch Maxted, Praed-street, Paddington, plumber, February 3, at 11—George Rule, Murray-street, New North road, slater, February 10, at 11.

TO SURRENDER IN THE COUNTRY.

William Masters Collinge, Newport, Monmouthshire, painter, January 27, at 2—Joseph Hunter, Spilsby, carpenter, January 22, at 11—William Powell, Leicester, plumber, January 25, at 10—Joseph Priestly, Snaith, gas engineer, January 27, at 11—William Wakerley, Leicester, joiner, January 31, at 12—Thomas Archer, jun., Dunston, engine builder, January 22, at 12—James Courtney, Exmouth, builder, January 21, at 11—Charles Cuff, Wolverhampton, carpenter, January 20, at 12 Henry Etheridge, Mansemore, Gloucestershire, builder, January 22, at 12—David Harding, Willingdon, Sussex, builder, January 23, at 11—William Jones, Liverpool and Woolton, builder, January 22, at 11.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

February 11, R Marshall, Everton, builder—January 24, J. Martin, Liverpool, contractor—February 20, W. H Palmer, Tysoe street, Clerkenwell, surveyor—February 18, R. H Bird, Hammersmith, builder—February 20, J. J. Lovegrove, Ilewoith, decorator—February 20, A Barnsby, Old Brentford, barge builder—February 21, W. Hey, Meadow-row, New Kent road, architect—March 5, J. Smith, Great George-street, Westminster, contractor—February 5, S Robinson, Richmond-street, City road, marble mason—February 5, R. Atkins, Blacklock-road, Holloway, builder—January 29, J. Simmons, Bow common, brickmaker—February 3, C. R Teagne, Old Jewry, surveyor—February 5, M. J Hobbs, Kingston on Thames, plumber—February 24, W. Kean, West Bromwich, timber merchant—February 5, J. Whitebread, Paddington, builder—January 24, C. Lucas, Leckhampton, stonemason—February 3, R. Smith, Blackburn, plumber — February 14, R. Watts, Penyglodfa, carpenter—January 30, J. Barbage, Cambridge, builder.

PARTNERSHIPS DISSOLVED.

Mortimer and Co., Leeds, builders—Tomlinson and Son, Hulme bricklayers—G and T. Figg, Ampton-street, Gray's-inn road, and Gunpowder-alley, Shoe-lane, builders—J. and S. Melton, Dartford, builders—Middleton and Bissell, Birmingham, architects—Smith and Co., Leicester, engineers.

DIVIDENDS.

February 7, E. and L. Powell, Hereford, builders—January 23, J. T. George, Cumbourne, builder—January 29, P. Hill, Garston, brickmaker—January 29, L. P. Santos and H. Evans, Liverpool, merchants—January 27, J. Mitchell and J. Flet her, Altrincham, dyers—January 23, W. and S. Green, Keighley, builders.

DECLARATION OF DIVIDEND.

M. Yeatman, Winbourne Minster, builder, div. 3s.

THE BUILDING NEWS.

LONDON, FRIDAY, JANUARY 24, 1868.

CRITICISM *VERSUS* CREATION.

THIS is a strange, but it is to be feared a true, issue. The present is an age of picking to pieces. Every department of intellectual activity supplies abundant evidence in support of this proposition. In literature we are busy with the past, taking down the dusty volumes from the shelves, where former generations have laid them, reproducing, re-examining, and rehabilitating the opinions and even the reputation of men who have long since finished the sum of their labours and laid down to rest. In art, a very small acquaintance with the so-called "works" of the day must suffice to convince any observer of ordinary intelligence that, if the "originals" were carefully eliminated from the "copies," it would not be difficult to number the former on one's fingers. Meantime, there is no little activity in the art world, no lack of noise, and plenty of spirit. From Mr. Ruskin downwards, every one is engaged in exposing faults, and very occasionally point out excellences. In short, all the best and most earnest work in the world is critical, and the best and most earnest men are critics. At first sight this may not appear an evil. Nor is it one, considered apart from other circumstances. But when the work of criticism comes to supersede that of production—when the critical faculty is found to be developed at the expense of the creative—then a great evil results. The age is not one of real progress. Those who come after us will find that we have done little, if anything, to help matters forward. The most they will have to say in our favour is that, by dint of hard digging, we contrived to turn up some treasures, and that, by means of harsh criticism, we succeeded in the destruction of a few fallacies. Is this a worthy sum of work to be placed to our credit in the great record of human progress? Will it win for our memories many laurels, or achieve an enduring fame? The answer must be, No! and, while we are engaged in this unproductive labour, the opportunity for more substantial achievement is passing, and, still worse, the place of real work is being filled by that which is spurious.

While our best men are engaged in a critical crusade against the bad in art, and are busying themselves with the demolition of theoretical evils, more practical workers of far less ability are building the edifices which will last for scores, perhaps centuries, of years, the unimpeachable proofs of our impotence, and even of our poverty of expedient; and in every department of work men of small calibre are setting their hideous marks on the age, while the minds of a higher order are making themselves and everybody about them miserable by graceless though clever criticism. This is a very serious matter. It is serious for the world, serious for art, and serious for those who are misapplying their talents. We are by no means sure that Mr. Ruskin, and those who follow in his steps, are not doing more harm than good by the line they are pursuing. No doubt clever criticism is a valuable help to the ripening skill of the honest worker. Engrossed with his task, he cannot see things from an artistic point of view, and the critical faculty of a friend, or even of an enemy, may help him. It is, therefore, well that there should be critics, and, if they are as numerous as clever, there can be no cause to complain, provided only that the army of professional fault-finders is not needlessly recruited from the ranks of the army of creation. This is the circumstance we deplore, and the fact that so many of our best workers are talking rather than acting has led us to think that it may be worth while to throw out a hint on the subject.

It would be easy to name many who began to do good art work, and have quite abandoned the task for the desultory, and perhaps, on the whole, easier occupation of picking holes in the works of men around them. Granted that these men have met with much to dishearten them. The world has not been kind—certainly anything but considerate with respect to their efforts. Perhaps they have not been appreciated as their talents deserve. But why retire discomfited? Young men not yet at their meridian faint before the sun of their lives has climbed to its zenith—weary of work and skulking in the shade ere the burden of the day has reached its maximum. What a pitiable sight! It is nothing to the purpose that each of these unproductive geniuses can give a very sufficient reason for his idleness. "It is impossible to make people love and appreciate real art work. The age is so hopelessly commercial that true excellence is sacrificed to meretricious value. The day is not ripe for art. Things are come to such a pass that we must abandon the whole business, and retrace our steps, to regain the thread of real truth and goodness in the art of the thirteenth century." These, and a score of like excuses, are not worth one cent when they come to be weighed against the fact that all who can work, but refuse or "decline" to do so, and take to fault-finding, are not only guilty of a negative error, but commit a crime against the cause in which they profess to be engaged.

We begin to suspect that the issue is even deeper than that involved in the case as we have stated it—"Criticism *versus* Creation." It is just possible that the critical faculty is incompatible with the faculty of creation. Either the propensity to find fault becomes in time so strong that the man begins to criticise his own works, and fails to produce anything capable of surviving the ordeal; or else the energy of the brain is so concentrated on the business of fault-finding that there is none to spare for any other enterprize. Should it be true that those of our art workers who have taken so largely to criticism have lost the power of production, and this is why they are beginning to decline competitions, and in other ways to cease from their once busy labours in the world of art, the cause is no less to be regretted then the consequences. When clever designers of cathedrals, town-halls, and churches turn to censorship of art, a certain evil as well as a contingent good results. They may detect and expose errors with masterly ability—they may even go farther, and do positive service by advising their own clients, and the clients of other men, sagaciously on art matters, but the work of design and creation they once did is lost. The same amount of work is done, because the world is not over-eclectic, and cries ceaselessly "give, give, give;" but other men, with less power, and incomparably less real talent, satisfy the necessities of the passing moment, and in so doing erect permanent monuments, not only to their own shame and incompetence, and to the lasting discredit of the age, but to the undying disgrace of those who shirked the duty of real and original work in the world, and took, as a pleasure or pastime, to criticism. No ephemeral trimphs of critical skill, or imaginary benefit to the taste of the passing moment, will atone for this grievous sin against and practical desertion from, the ranks of her pioneers and defenders.

MARKS ON DEALS AND QUALITIES OF TIMBER.*

FELLING, SELECTING, AND TRANSPORTING TIMBER.

THE growth and selection of timber suitable for commercial purposes leads us to its home in the forests. Where quality is not an object, economy in point of cost steps in, and common goods are traded in to the largest extent, from the nearest points to the markets of consumption. The native-grown timbers of Sweden and Norway lay claim to this position, both in the English and French markets. Unlike the Russian forests, where the timbers of finest growth are only selected, those of Sweden and Norway may be felled without regard to size and quality. They have a ready market for every quality, one which is guarded from competition by the lowness of freights. The finest of the Swedish timbers are selected for conversion into deals, or to be hewn into squared timbers—their faulty wood may find the same channel as seconds, thirds, or fourths deals, or as brack logs of hewn timber. Their smaller sizes are used for conversion into boards or battens, and into small timbers used throughout the mining districts, and for building purposes along the seaboard counties of England and Scotland. Diminishing in scale, we are introduced to the short square or round logs shipped in such amazing quantities for railway sleepers. This is a comparatively new branch of the timber trade, dating from the extension of the railway system. Until very recent times these "tramways," as our American brothers call them, were laid upon sleepers of English growth, larch being the class of wood most deservedly employed. As this timber became scarce and costly, sleepers of Scotch fir were introduced, the objections to them on point of durability being overcome by the invention of creosoting. At this point the timbers of Norway and Sweden were brought into competition with those of the English and Scotch forests, and from that date "the sleeper trade" has grown into gigantic proportions. An inferior article once introduced, no matter under what disguise, speedily breaks through strong prejudice; and as pre-existing matters fall into disuse, the new competitives rise into importance. We have an illustration of this fact in the sleeper trade. When the wood of the Scotch fir was first introduced, it was only with the aid of creosoting. At that time every sleeper was creosoted. As time wore on, the attempt was made to lay them down without this preserving application. Economy—be it truly so or not—taught our engineers to pursue this course, until now they are generally used green from the forest, and creosoting is becoming a thing of the past. Thus has the sleeper trade been added to that long list which centres in the forests of Sweden and the wooded districts of the Baltic Sea. Continuing the uses to which the diminished timbers of the forests are applied, we have the sister trades of pit or mining props and telegraph poles. These are either round, square, or partially square, and are regulated in their value by the sizes of their tops, and somewhat by their length. This is particularly the case with mining props. If they are 3in. tops and a long specification, they are of more value than short specifications. As they taper considerably the butt ends may thus be applied to purposes for which props with 4in. or 5in. tops may be used. In instancing their value, we may note that they are sold per six dozen or 72ft.; 3 tops will rate at 3s. 9d., 4 tops at 4s. 9d., and 5 tops at 6s. For mining purposes, although largely used, they are inferior to the English-grown larch, which is always preferred, even at double or treble cost. These small timbers, composed of robust, healthful trees, are nearly wholly sap-wood. A 7in. or 8in. butt will rarely show more heart wood than can be covered with a half-crown piece. When used as telegraph poles they are either charred at the bottoms, or subjected to a half-bred process of creosoting. In some cases they are creosoted throughout their entire length. Practice has taught us that decay first seizes upon this class of wood at the ground level, and that the best means of preventing it is to case the wood with a sheet of zinc, extending from six inches below the ground to six inches above. Although this principle is not largely adopted with telegraph poles, it is generally with fenc-

* Continued from page 24.

ing poles round the enclosures of timber yards. Still diminishing in size, although it must be noted that we are changing from red wood to white, we have the scaffold poles of our builders, which are sold when poles by the sizes of their butts, being divided into two classes, either over or under 4in. in diameter. When they are below 2½in. at the top ends, they are sold as rickers at so much each. In this case they are generally 22ft. long. With poles of the above description, their value will be ruled by the specification. "A fair average," as it is called in the trade, will be 33ft., sixty per cent. of them being over 4in. at the butts. In value they would rate at 1½d. per foot for the over 4in., and 1d. per foot the under 4in., the "rickers" being sold at 1s. 7d. each. These prices must be taken as an average, as they vary to a great extent in different parts, being influenced by the distance from the native forests, and the cost of ground for storage. Taking Sunderland, Hartlepool Hull, London, Liverpool, and Bristol, we have an advancing scale of freight which swells the cost of the goods, and it is no uncommon thing for goods to be put on rail at these northern depots, and despatched to London, Liverpool, or Bristol, to compete with goods shipped direct to these ports. Before closing this review of the various purposes to which the produce of the Swedish and Norwegian forests are applied, we may note a still smaller class of wood which is shipped to this country as "spars." These are considerably smaller than the "rickers" spoken of above, and are mainly consumed at the ports to which they are shipped. These are not applicable to the builder or contractor, but are used by the boatmen on the rivers, and fishermen on the coast, as poles for boathooks, spars for sails, and other allied purposes to which wood of a light and tough nature can be applied. With such a field before them, we need not wonder at the growth of the timber trade in Sweden and Norway, nor need we be surprised at their mode of felling trees, being able to cut down all before them, as, for one purpose or another, they have a ready market.

As we advance northwards along the coast of Sweden, we are introduced to different customs. Here the smaller trees cannot be felled to a profit; and, although they have a large sale for common goods in a converted form, still it is not every tree that will give a return for conversion; a medium-sized tree will pass through the saw-mills at the same rate as the smaller ones, and produce a better result; it thence follows, even with common goods, that the forest trees are selected. As we advance still further northwards, and are introduced to the ports of Gefle, Soderhamn, and Sundswall, where are shipped the best of Swedish goods, this selecting of the timber is pursued on a more developed scale. The forests are penetrated for miles inland, and trees of the finest growth are alone subjected to the axe of the woodman. The trunks are divested of the tops, branches, and the bark, and in this naked form are slung on wheels and conveyed to the banks of the nearest lakes or rivers, and cast upon the waters. Travellers in these districts are charmed with such scenes, and speak in rapturous terms of the deep and silent lakes skirted by everlasting forests, the only scenes of life being a few daring men piloting a raft of timber, propelled by the current of the water, or an improvised sail, oar, or paddle. Along the wooded margins the stillness may be broken by the tramp of horses and the shouts of men and women, as they near the waters with their heavy loads. The next moment the clean white trunk of some lord of the forest will be reflected in the lake—a splash of water, and the sudden return of the rude foresters with their train, tells us that one other tree has been rendered up to the demands of ever growing commerce. This custom of selecting timber in forests is a matter of considerable interest, as the purposes for which they are selected varies with different countries. At Riga, the finest timber is selected for ships' masts, for both the British and French navies. Men known as "mast brokers" are sent into the provinces to select and mark the trees as they stand in the forests. The finest are grown in the districts which border the Dneiper, and are from thence transported by land (about 23 miles) to the Dwina, where they are rafted in lots from 50 to 100 each, and floated down to Riga. These masts are valuable from their length and size, ranging from 18in. to 25in. in diameter, and from 70ft. to 80ft. in length. They contrast strongly in size with the timbers of Sweden and Norway, which in no case range above 18in. From the fact of such fine timbers being shipped from Riga, the French botanists imbibed the notion that they were a different species to the ordinary Scotch pine. This led the Minister of Marine of the French Government in 1785 to send a master mast-maker, named Barbe, from Brest, to Riga, to obtain seeds of this particular class of timber. He brought back a great quantity, which were sown in different districts in France, but in every case they produced the ordinary Scotch pine. With botanists there is still a variety of the Pinus Sylvestris called Pinus S. Rigensis, the Pin de Riga, Pin de Russie, and the Pin de Mature, of the French. It was the fact of the forests of Livonia and Lithuania, where the Scotch pine grows to its greatest size and perfection, that led these old botanists into the above error. The effects of soil, climate, and locality upon the growth of timber are such that generations of botanists have been led into the delusion that they have added new pages to the history of science by their fancied discoveries. There is, perhaps, no tree in the list of those useful to man that shows more variation under the influence of circumstances than is the case with the Scotch pine. A giant of the forest in Southern Russia, and a stunted shrub in the North; a towering mast, with a small conical head, in the dense shade of the forest, and a picturesque tree, with wide-spreading arms, in the open field; on strong clay lands producing a highly-coloured resinous wood, and on poor sandy land a white, tender, worthless material; one which upon the debris of granitic rocks will thrive, and upon the most fertile districts of the chalk will pine for nourishment.

Pursuing our subject of selecting timber in the forests, we are introduced to the best Russian shipments, and we shall there learn why their shipments are so vastly superior to those of Sweden and Norway. These goods are brought from great distances—the best trees have long since been felled in the home forests. We have a natural feature at this stage which is worthy of notice—where the largest trees in a forest are ready for felling and are cut out, those in the neighbourhood are interfered with by the admission of light and air, and, although in a few years they may grow as large as their prostrate brothers, they are only a second crop, inferior in quality to those selected in the first instance from the primeval forests. Such is the delicate nicety with which unaided nature shapes her works, that the best shippers will only purchase trees felled from the virgin forests. This compels the goods to be brought from greater distances, and thus, in point of quality, keeps the best shipments at high prices. Best Archangel goods are now rating at £13 15s. per Petersburg standard; the best shipments of Petersburg (Gromoffs) at £12 15s., other shipments from £11 15s. down to £10 15s.; the best Swedish brands from £9 15s. down to £8 15s. The great Russian forests are the property of the nobles, and during the toleration of serfdom the felling and conversion of the timber was carried on by gangs of these humble peasants on the lordly soil. As the rivers are the main agents in its transport, and they are only active during the summer months, it naturally follows that the felling of the timber is carried on during the interval, *i. e.* in the winter. We in these temperate climes have no conception of the hardships attending this life in a Russian forest. A party of these woodmen will start into the woods in the early morning, lighted only by the reflected light of a far distant sun, whose influence is all but lost beneath the thick overhead covering of dark sombre firs, whose branches are loaded with snow. Part of the group may be mounted on horses following in single file through the narrow tortuous paths of the forest. Those on foot are spreading wide on either side, walking upon the surface of the deep snow in clumsy snow-shoes, which are composed of a hoop like piece of birch bent in the form of a battledoor, and plaited across with hemp cords to which their feet are fastened. These men are searching for trees suitable for felling, picking the largest and straightest trunks, and those possessing the cleanest and yellowest bark, rejecting nine hundred and ninety-nine in every thousand. A suitable tree is found, the snow is cleared away, and the axe is stalwartly applied. Having been prostrated, the top is cut off, leaving a trunk of 60 or 70 feet. The next process is to divest it of its bark, and cut a groove or chase round the smaller end, in which to fix a rope; six or nine horses are then yoked to the log, the leaders and the followers are mounted, as are also most of the other horses, and the log is moved along the surface of the snow. The upper side of the log is morticed at the butt-end for the insertion of a hand-spike, and, as the tree is drawn over hillocks and along the circuitous paths of the forest, this hand-spike serves as a helm to guide it on its way. The conveyance of these large trees, the long lines of horses, and the number of fur and skin-clad men accompanying them through the forests and across the fields of snow, present an appearance very interesting. Strange as it may seem, in many cases, what with sledging to the rivers and rafting to the saw-mills (where the trees are delivered into the hands of the merchants), many of them are conveyed upwards of 1,000 miles. Even with this care of selecting, there is an average of 1 in 10 rejected by the merchant. This latter process of selecting is carried on jointly by the merchants and the noblemen's overseer, the test being the blow of a hatchet on the end of the log—if it produces a sharp sonorous ring, it is a sure sign of soundness; but, if it gives off a dull heavy thud, it is rejected as unsound. This principle of felling and sledging the trees to the banks of the frozen rivers is pursued through the long winter months, and, as the summer brings its attendant thaws, the piles of timber are moved off with the currents. As these logs are far more valuable than the indiscriminate class floated down the Swedish and Norwegian rivers, they are not allowed to take their own course into the open lakes, but the piles or rafts are tied together and men are mounted upon them as pilots. If it is a short journey they can brave the weather, but, if it is a long journey, they are housed in rude huts composed of wood and bark. Petersburg goods have to be rafted through the great Lake of Ladoga, which may be termed an inland sea. This is a work of great danger, as storms and sudden gales of wind will frequently occur, driving the rafts of timber far from sight of land to be beaten to pieces in the centre of the lake. Viewing this evil, and the great loss of life annually attending this staple trade, Peter the Great was led to construct the Ladoga Canal, along which the rafts are now conveyed with perfect safety to the River Neva, the stream of which carries them down to Petersburg, where they remain in the timber yards of the merchants till they are ready to be floated down to Cronstadt for foreign shipment. Austria, Prussia, and Germany are supplied with timber from the neighbouring mountains. Here the same life of hardship is led by the fellers in the forests, an illustration of which has been given during the present winter in the forest of Rothwell, in Austria. Eighteen of these woodcutters selected a valley at the base of a mountain range, and, as they were breakfasting in a hut, they were overwhelmed by an avalanche of snow, and along with their hut were swept

away. Three days elapsed before they were missed by their friends, and when a search was made for them eleven were extracted from the snow, seven of whom were dead, and the other four so exhausted by cold and hunger that they are not expected to live. The other seven have not yet been found. Such is the life of these toilers in the forests. They are entitled to our notice, as we are indebted to them, in the first instance, for our qualities of timber.

We shall conclude our notice of selecting timber in the forests by a glance at our brothers in the backwoods of America. The New World boasts of everything upon the grandest scale. The pine forests of the United States and Canada are the most extensive in the world, and they contain the most gigantic specimens of timber trees. Canada, with few exceptions, before clearing was commenced by European settlers, was one unbroken forest of pines and firs, which clad its hills and extended along its plains to the banks of the rivers, and even covering the river islands. The bulk of our Canadian timber is shipped from New Brunswick, and the timber trade in the North of Europe is assuming great magnitude. The following account of the mode of cutting the timber in the backwoods of Canada is abridged from the pen of M'Gregor. "Several persons form themselves into what is called 'a lumbering party,' under the command of a 'master lumberer,' who manages the whole. The necessary supplies of provisions, clothing, &c., are generally supplied on credit by merchants, who are to receive payment out of the stock of timber sent down the rivers the following summer. The party then proceed into the woods and select a place for their encampment, near a stream of water; here they build a log hut, forming a pit or cellar below it, to preserve those things which are liable to be injured by the frost. The cold is so intense that they are obliged to keep up a constant fire night and day, and they drink enormous quantities of rum, generally without water. When they work they divide into three gangs; one of which cuts down the trees, another hews them, and the third is employed with oxen in dragging the logs to the nearest stream. Here they lie till the snow begins to dissolve in April or May, when the rivers swell, or, according to the lumberers' phrase, 'the freshets come down.' At this time all the timber cut during winter is thrown into the water, and floated down till the river becomes sufficiently wide to make the whole into one or more rafts. The water at this period is exceedingly cold; yet for weeks the lumberers are in it from morning till night, and it is seldom less than a month or six weeks from the time that floating the timber down the streams commences, until the rafts are delivered to the merchants. No course of life can undermine the constitution more than that of a lumberer or raftsman. The winter snow and frost, although severe, are nothing to endure, in comparison with the extreme coldness of the snow water of the freshets, in which the lumberer is, day after day, wet up to the middle, and often immersed from head to foot." The lumberers of New Brunswick, and those who cut down timber in the United States, take great care to select trees of a proper size. A good authority states that not one tree in 10,000 in the woods is fit for the purposes of commerce.*

The Department of Science and Art are again busy in gathering examples for the forthcoming and concluding Exhibition of National Portraits, which will open in April next. The exhibition will comprise, first, portraits of persons (deceased) who lived between 1800 and the present time; secondly, portraits of persons living before the year 1800, who were unrepresented or inadequately represented in the two previous exhibitions. Portraits must be sent in not later than the 3rd of March next.

* To be continued.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE ordinary general meeting of this Institute was held on Monday evening last, Mr. Joseph Clarke, F.S.A., in the chair, at which M. Constantine Thon, of St. Petersburg, Government architect, and author of the work on the Palace of the Cæsars, Rome, was unanimously elected as honorary and corresponding member. Mr. W. Fogerty, of Dublin, and Mr. G. Judge, jun., of London, were elected as fellows; and Mr. H. H. Vale, of Liverpool, and Mr. Samuel Brooks, of London, were elected as associates.

Professor Donaldson (honorary secretary for foreign correspondence) announced in terms of regret the decease in November last of M. Baudirecter Fischer, architect, of Carlsruhe, and read a brief necrological notice of that gentlemen, translated from the "Carlsruhe Times;" also that the honour of knighthood had been conferred by the Lord-Lieutenant of Ireland upon Mr. Charles Lanyon, M.P., of Dublin, fellow of the Institute, and president of the Institute of Architects of Ireland, and that a letter of congratulation on that event from the Council had been forwarded to that gentleman.—The subject of the proposed New Building Act was introduced by Mr. Chatfield Clarke, with the view to inquire whether the attention of the Council had been directed to some of the provisions which he thought tended to hamper the profession very much in the execution of their works, more especially in the neighbourhood of London. He thought it most desirable that these stringent provisions should be watched by the Council in the interests of the profession generally.—Professor Donaldson stated that the bill in question had been carefully examined by the District Surveyors' Association, of which he was a member, by whom some emendations had been suggested, and submitted to the Metropolitan Board of Works. The proposed prohibition of the use of stone in staireases and other parts of the interior of buildings, which had excited so much surprise in the profession, he believed resulted mainly from the recommendations of Captain Shaw, with a view to the prevention of accidents at fires, but there were other provisions of the bill which required to be considered, and the subject could not be more appropriately taken up than by an independent practical body like this.—Mr. Charles Fowler joined in the request that the consideration of the Council should be given to this subject, and the chairman gave a promise to that effect.

The paper read was "On the Kremlin of Moscow," by Mr. Edward I'Anson, who commenced by some observations on the architecture of Russia, before it merged into the prevailing classic architecture of modern Europe. He would make a few allusions only to the architecture which he had the opportunity of seeing in other parts of the empire. After describing in graphic terms the imposing view which Moscow presented as first seen from the eminence of the Sparrow-hills, some three or four miles from the city, Mr. I'Anson dwelt, at considerable length, and with minuteness of detail, on the vast aggregation of buildings, especially of churches, there being no fewer than 32 churches and 170 chapels, cupolas, and towers, within the walls of the Kremlin. Situated in the centre of the town, the Kremlin, he said, is, as it were, the kernel of the whole city, and is wrapped round with the other portions of Moscow, and it is the oldest part of the town. It is nearly triangular in form, the base of the triangle next the river Moscowa, by which it is bounded on the south side, being, as measured from the map in Dr. Clarke's "Russia," about 2,000 feet. The greatest width on the north-east side is also about 2,000 feet. The total circumference of the walls is 7,280 feet, within which are numerous churches, chapels, and public buildings already mentioned. The walls are chiefly of brick, as, indeed, are almost all the buildings incorporated with or contained within them. The finest range of towers is on the river-side, where they are seven in number. Beyond the long vista of towers on the river-side is a modern church, much larger in size than the churches of the Kremlin, viz., the church of St. Saviour, still in progress, the interior of which is being finished, as he was informed—for he did not visit it himself—with the richest mosaics and coloured decoration. Externally, the bulb-shaped domes are remarkably elegant in their contour. On the north-west side there are five towers, the most ornamental being the Trinity Tower. After giving a description of this and the succeeding towers, Mr. I'Anson proceeded to point out the leading characteristics of the various gateways forming the entrances to the Kremlin. Having described the Kremlin walls, he now entered the interior. As the heart of Moscow is the Kremlin, so the heart of the Kremlin is the patriarchal Cathedral of the Assumption, or Repose of the Virgin. This, one of the oldest and most interesting churches in the Kremlin, is in dimensions what, in the West, would be called a chapel, rather than a cathedral, but the smallness of space is forgotten in the fulness of its contents. On the platform of its nave, from Ivan the Terrible downwards to this day, the Czars have been crowned, and along its altar screens are deposited the most sacred pictures of Russia. Round the walls are buried the primates of the church, and at the four corners lie those most highly venerated. The floor is paved with slabs of polished steel. Hieroglyphics and pictures constituted more than half the education of these grown up children of the ancient world, and they still constitute more than half the education of these grown-up children of the modern world. Notwithstanding various alterations and repairs at various epochs, the Cathedral of the Assumption probably retains much of its primitive form, and is, therefore, one of the most interesting church monuments in Russia. Next to this, in situation and size, is the Church of the Archangel Michael, where lie, each in his place, the coffins ranged round the wall, the long succession of Czars, from the founder of Moscow to the predecessor of the founder of St. Petersburg, and twice a year a funeral service is performed for the sins of all of them. Near to the two churches above-named is the third most important church in the Kremlin, and completing the group of those intimately connected with the history of the Czars. This is the Cathedral of the Annunciation, in which the Czars are baptized and married. It is the smallest of this group of three monumental churches of the Kremlin. The arrangements and decorations of this cathedral were described in detail. Amongst the other objects of interest in the Kremlin is the lofty tower or belfry of Ivan Veleki—John the Great—erected in the year 1600. The cross on the summit is about 18ft. high, and the total height about 270ft. It is one of the buildings injured by the French during their occupation of Moscow, all traces of which, at the time of the author's visit, were concealed by plaster and whitewash. In the lower part is a chapel dedicated to St. John, the tower being, in fact, its campanile. Above this are suspended thirty-four bells, the largest of which weighs no less than 64 tons or about 140,000lbs. The celebrated great bell of Moscow lies at the foot of this tower. The weight at present is 440,000lbs., its height 19ft. 3in., and the circumference 60ft. 9in.

In size, no building in the Kremlin approaches that of the palace and treasury combined. Within the palace, in addition to numerous magnificent rooms appropriated to state occasions, is also a labyrinth of fourteen chapels, multiplied by sovereign after sovereign, till the palace has become more like the dwelling-house of the Pope than of the Emperor. These chapels, crabbed-ribbed, low-browed, painted within and without, in the old barbaric grotesqueness of mediæval Russia, are encased with the external magnificence of modern civilization and European grandeur. The treasury, which adjoins the palace, contains a vast collection of trophies and standards, coronation, church, and state robes, crowns, imperial orbs, plate, &c. In addition to these, there is still another palace, a small church, the sacristy of the Holy Synod, the Miracle Monastery, the Ascension Convent, the High Court of Appeal, and several Government buildings. That which he would last allude to—the arsenal, which stands close to the Nicholas Gate—is a building of the date of 1713, where are deposited the enormous guns taken by the Russians to the large number of 875, of which no less than 365 are the cannon taken during the retreat of the French, and, as the least honourable place, they lie prostrate on the ground. The Austrian, Italian, and other trophies of war lay tier above tier over the French pieces below. Mr. I'Anson next proceeded to describe the church outside the Kremlin, known as the Church of St. Basil. This is the name given to one church in the general structure, still it is only one of twenty-one churches which are there co-existent, the whole together being known to the natives as the Cathedral of the Protection. Although styled a cathedral, the building is circumscribed probably within 150ft. square on the ground, agreeably spiry in form, with nearly a dozen domes grouped around a central summit, like a close clustering grove of young pine trees. There is

harmony among them, yet with variety infinite. The titles of each of the coalesced churches, as given by Lyall, were enumerated in the paper. Immediately adjoining the Kremlin, to the north-east, is the Chinese quarter of the city—the mercantile part—which is walled round like the Kremlin. This also has its ancient gates, and several ancient (for Russia) buildings within its walls. One of them is a small church,—"the Mother of God of Georgia," which is a perfectly typical church, nearly square in form, from the roof of which rise elongated octagonal spires, crowned with five bulbous-shaped gilt domes, terminated by the usual lofty cross, standing over the crescent. In this quarter of the city are also the corn magazine, the custom house, the fish market, and an establishment peculiar to Russia, closely resembling the bazaars of Constantinople or the French passages.

Mr. l'Anson went on to remark that the modern churches of Moscow and all the others he saw in Russia are in the Italian style, generally of the worst character, from which, however, he excepted one great church, the work of a French architect, the St. Isaac's Church, which he described as a grand and imposing building, having the usual central dome and the four small surrounding domes common to all the Russian churches. The great ribbed dome is covered, it is said, with actual plates of gold, and the imperial records have never revealed the cost of this church. It is a great, but not a Russian work. The domes of the churches were described as being, for the most part, more graceful than those of Constantinople, and approaching nearer to the form used in the tombs of the Caliphs at Cairo. A striking feature in the neighbourhood of Moscow is the number of important monasteries which stud the plain in many directions, and are most of them very extensive, for they contain within their walls the conventual buildings and many chapels, bell-towers, and burial-places. Mr. l'Anson next proceeded to speak of the great extent to which picture veneration is carried by all classes throughout the whole of the empire. These, in public and in private, constitute the consecrating element. Sacred pictures are to be seen in the corner of every room, at the corner of every street, over gateways, in offices, in steamers, and in taverns, with the lamp burning before them. It is against the canons of the Church to have any graven images in the churches, and, therefore, the decoration is confined to pictorial representations; but the strict rule is often departed from by embossing the background to the pictures, and the jewelled crowns with which they are surrounded are in full relief. St. Isaac's Church at St. Petersburg was the only church in which he recollected this rigid rule was departed from, the general rule being that the edifices themselves are as simple and undecorated as possible. The apsidal termination, as far as he saw, was a constant feature in all the churches. Another subject of remark was the marvellous value of the decorations of gold and silver and precious stones in the churches and on the shrines and tombs, the priests themselves, often men of great stature, being clad in heavy gold and pearl-embroidered robes. And all this took place in a country where there is hardly any metallic currency in circulation. Mr. l'Anson then referred to the large bequests made by the wealthy portion of the population to the funds for the preservation and repair of the churches, more especially for the large amount of gilding to the roofs and domes which, with the other parts of the buildings, suffered from the extreme severity of the climate; and, in conclusion, he remarked that the source from whence the architecture of Moscow was derived was, he thought, clearly Constantinople. The historical evidence on this point appeared to him conclusive. Any observer who had seen the architecture of Constantinople could not doubt as to its being the parent of that of Russia. As regarded the towers, there is a more complete Italian feeling than in the churches. No doubt the plan was precisely defined by the tradition and usages of the Greek Church; but the whole treatment is traditional, just as we in England now cling to the older form practised in church-building. There could not be a more suggestive type of the architecture of the Kremlin churches than several of the fine fountains in Constantinople. Although the relation between the two nations has, from political causes, in modern times not been always preserved, yet, in earlier times, and in ecclesiastical matters, the relations between the two were always preserved with filial fidelity, the more remarkable from the reversal of their respective positions in everything else. It was said generally that Russian architecture is not original, and that it is a coarse and rude imitation of other works; but he asserted that all the three principal churches of the Kremlin to which he had referred more particularly in detail have a distinct and special character, and, on the whole, he felt that the Russians might fairly lay claim to very considerable ingenuity, good taste, and artistic power.

A brief conversation, in which Professor Donaldson, Mr. W. Haywood, Mr. Basil White, and Mr. Chas. Barry took part, followed the reading of the paper, in which it was sought to elicit from the author of the paper a more definite opinion with regard to the distinctive features to which Russian architecture could lay claim; but on that point Mr. l'Anson said he could give no further opinion than that which he had already expressed upon it

The paper was illustrated by photographs and drawings of the principal buildings referred to.

A cordial vote of thanks was passed to Mr. l'Anson for his elaborate and interesting paper.

ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting was held on Friday, the 17th inst, the president, Mr. R. Phené Spiers, in the chair. The minutes of the last meeting were read, and Messrs T. Verity and R. E. Purchase were duly proposed and elected members of the Association. The president then introduced Mr. H. Matthews, who read a paper on "Painting as a Fine Art and its principles, and their full development in the works of the ancient masters." Painting, said Mr. Matthews, although not recognized by the ancients as one of the fine arts, was, nevertheless, well-known and practised by them. The graver and the pencil wrote an universal language, and their uses were probably known to many nations before the art of writing. The Egyptians practised painting to a very large extent in the decoration of their stupendous architectural monuments, and thus by the hieroglyphical paintings furnished to us the only source through which we became acquainted with the history of that wonderful people. The Greeks, before the time of Alexander the Great, were not especially distinguished in the art, and were only acquainted with four simple colours, white, yellow, red, and black. Yet with these poor materials, Zeuxis and others produced their great works. During the time of Alexander the art rapidly flourished, owing to the great encouragement given by that monarch. Pliny tells a story of two contending painters of this age, one of whom painted grapes so naturally that the birds came to peck at them, and the other, a curtain so well, that the judges attempted to draw it aside, thinking his picture was hidden behind it. The conquest of Greece by the Romans afforded that people an opportunity of becoming acquainted with its art treasures, but it was not until the time of Augustus that painting obtained any great pre-eminence among them. During his reign the art rapidly spread in the decoration of buildings, and the style known by us as Arabesque was introduced and extensively practised. After his death, however, painting again seems to have been neglected, for Pliny tells us that, between the reigns of Augustus and Vespasian, their lived only seven or eight painters of any celebrity. The early Christians at first entirely eschewed the art, considering that it tended to sensuality and heathenism, and then only used it to represent symbolical subjects and monograms, such as the cross, the anchor, the sacred monogram—the shepherd, with a flute, to represent our Lord; the ship buffeted by the waves, to represent the Church, &c. Upon the establishment of the Papacy, the churches began to be adorned with paintings copied in a great measure from works of art found in the catacombs, and the art began to grow into considerable importance. Charlemagne very greatly encouraged it, and during his reign it flourished, but declined at his death, and was only kept alive under the fostering care of the Roman clergy. While thus alternately rising and declining in the West, Constantinople, in the East, had attracted, among artists of all kinds, many great painters, the fame of some of whom still exists. Not till the thirteenth century did the art again revive in the West. In 1276 allegorical subjects first began to be represented. In 1349 a guild or body of painters was formed, under the patronage of St. Luke; a similar society had also been established in 1290, but embraced as well other artists of design. The clerical element, however, greatly prevailed in both these societies. Many potent and noble families now began to cherish painting. Ludovico Sforza, Duke of Milan, attracted many artists to his court, and placed his academy under the care of Leonardo da Vinci, one of the greatest masters of his style and age. At the close of the fourteenth century the existing schools of painting were the Italian, the German, Flemish, Dutch, French, and English. The Italian school was divided into those of Florence, Rome, Venice, Verona, and Lombardy; and, again, that of Lombardy into those of Parma, Cremona, and Milan. Art, now declining elsewhere, began to flourish vigorously at Florence, under the patronage of the powerful Medici family. Cosmo, and his son Lorenzo the Magnificent, drew to their court all the greatest men of the day, among others the great Michael Angelo, who, in boldness of style, grandeur of conception, and strength of manner, surpasses all others. Going to Rome, he was commissioned by Pope Julius II. to paint the ceiling of the Sistine Chapel, the whole of which, dissatisfied with the performance of artists whom he had engaged to work under him, he executed himself. His greatest work is the Last Judgment, painted for Paul III., who wished it in oil, but was refused by Michael Angelo, who declared that oil painting was only fit for women. Raphael, who was called the prince of painters, was also employed by Julius II. to decorate the Vatican, and by Leo X. to prepare the famous cartoons for the tapestries. Mr. Matthews proceeded to give an interesting account of the school of Venice—pre-eminently the school of colour, and of which Titian was the greatest master. He then sketched, at some length, the other Italian schools, and regretted that time would not permit him to complete his paper, by giving an account of the Flemish, Dutch, German, French, and English artists. He trusted that what he had read had interested the members, and would induce them to pay frequent visits to our National Gallery, for the purpose of studying the great masters.

After a short discussion, a vote of thanks to Mr. Matthews was carried, and the meeting terminated.

DESIGN.*

THE subject of my paper in its broadest sense may be defined as the mind, or the imaginative spirit, possessed by the followers of every branch of the Fine Arts. Whether I name the painter, the sculptor, or the architect, you will at once admit that the faculty which he must possess, in a greater or less degree, in order to attain to excellence, and to make a name in his profession, is the power of design.

Design is the inventive quality of Art. The materials with which the artist conveys his thoughts (his designs) to those around him, and the skill with which he employs those materials, though important details of Art, are insignificant when compared with the inventions of fancy which even in the best, the truest, Art, they most inadequately depict or represent.

The painter's pencil, and the sculptor's chisel, though wielded by the most skilled craftsmen (in the absence of the power of conceiving or realizing original ideas), produce but very tame and imperfect results. I do not deny that the dullest individual might be taught to use the pencil or the chisel with precision, and the technical details of Art may be acquired by all who will devote to them sufficient time and study; but, to go a step beyond the sphere of the copyist and the imitator—for this is the limit of technical excellence—to produce an original thought, or to embody a new idea, is the province of the real artist, and can never be arrived at by simple study.

Almost everyone, however, possesses to a certain extent this inventive faculty, and, although it can never be instilled by study, it may be improved and perfected by it; in fact, the development of this gift in its varied forms is one of the most important provinces of Art education.

My object now is, not so much to submit to your notice what has been, or what may be, done in the way of training this inventive power of the Art student in what is called Fine Art, as it is to consider another signification of the term "design," namely, the adaptation of ornamental forms to the enrichment or decoration of given surfaces or objects. The subject, even thus narrowed, admits of consideration in many ways. I shall endeavour, firstly, to trace, as concisely as possible, the origin

* Read by J. R. Redgrave before the Associated Arts' Institute, January 4th, 1868.

and growth of ornamental design, and then point out the manner in which the facts thus elucidated may be employed in the formation of rules and principles for the guidance of the specially trained artistic designer.

The oldest existing monuments of our race, those of the Egyptian and Assyrian nations, teem with suggestions of the utmost value to the student on the application of ornamental forms, not only to the grand bold outlines of their temples and palaces, but even to the minutest articles of their furniture, their utensils, and their clothing. Incised in almost imperishable materials, the vast granitic blocks of Luxor and Karnac, and engraven on the marble walls of Nineveh, are to be found the simple and beautiful conventionalized forms which may be called the alphabet of the designer. Here may be seen the rudiments of the fret, the anthemion and the wave scroll of the Grecian artist, and we may trace them back to the natural forms which surrounded the workers of Egypt—to the lotus which floated on her rivers, the papyrus which bordered her lakes, to the palm branches which gave fruit and shelter, to the ripple of the Nile waters, or the curling waves of the sea into which it flows. The forms are derived from Nature—we recognize the type, yet they are not imitative, but conventionalized and subordinated to a law of symmetry, and adapted to the stern and grand outlines of her architecture. Here, then, are seen two principles, which will be found to pervade all really good Art.

But we must reverence and esteem this early people more, perhaps, as the foster-parents and precursors of the Arts of Greece, than for the correctness and beauty of their own art. Surely if Greece owed much of her later refinements and perfection to the Egyptians, there must be much in their work, for this cause only, which should inspire us to find out what is good and beautiful therein. From Egypt, Greece learned that "simplicity of form is an element of beauty," a maxim that we in these days may well cherish and ponder over. From Egypt, Greece learned the use of colour in assisting and enriching the elementary forms of the mouldings of her temples. And, lastly, to Egypt she owed what, after all, was the great cause of her unequalled success, not only in her arts, but in every other aspect which has rendered her in all times a model for other nations—her civilization.

Unlike Egypt, the details of Grecian architectural ornament are rarely to be traced directly to natural forms. Those we have named as transmitted to her from Egypt, the Grecian artists refined to the utmost purity of grace and elegance. Satisfied with a few ornamental forms, and not recurring to Nature for new themes, the Greek age after age studied to perfect those he had adopted—to purify the curves, to dispose the varying quantities agreeably, and to adapt the relief to the surface, with the most consummate taste and the keenest sense of beauty. Thus the principles to be derived from the study of Greek ornament, are refinement of line and curve, and the most perfect subordination of the ornament to the object ornamented.

The ornaments of Greece, which had come down to us only as sculptured on her temples or painted on her pottery, may be characterized as in the highest degree pure and severe. I know of no example of the use of natural forms—all her enrichments are conventional. The decorations are applied only to the leading lines of the temples, and to the borders of the draperies and garments: the Doric period of Greek Art, the age when her manners were most pure and her culture had attained its highest excellence, is particularized by the utmost severity of its architectural forms, and the simplicity of its ornament. As Greece became more and more voluptuous, her Art became more florid, and in the continuation of her Art by Rome, we lose entirely the features by which Grecian Art has been described. Rome possessed herself of the outlines of Greece, and plastered them over with abundance of weak and coarse ornament. She degraded the higher curves of her mouldings, multiplied the minute parts of her orders, and increased the impost of her ornamental forms, until the Art of Rome, founded upon the most perfect Art in the world, inspired by the same associations, dedicated to the same religion, and surrounded by all that was perfect in the simple and beautiful Art of Greece, sank so low that it became extinct. The greatness of Rome as a nation ceased to protect her from despised barbarians, and, with the fall of the Roman empire, Art was, we may almost say, exterminated. The ornamental arts, as practised in Greece, I have shown to be the growth of ages—advancing when sound principles were observed, but rapidly retrograding when the magnificent Roman sought pomp and splendour rather than refinement and grace, and elevated ornament from being a beautiful and subordinate accessory to undue importance and over-prominence.

In the Divine books we read of ornament derived from another source, and intended for the decoration of the tabernacle of the Most High. 500 years before Homer sang, and 1,000 years before Phidias wrought, artists of Judea were inspired for that sacred work. Nothing of this Art remains; even the Temple, subsequently built and rebuilt on Zion, has been so completely razed by the Assyrian and the Roman, that the very place where it stood is disputed, and our countrymen are at this moment mining and tunnelling to search for its foundations. Yet from the Bible we learn certain facts regarding it. We find that it also had its types in Nature. We read of the almond and the pomegranate, alternated by a simple symmetrical law—we read of entwinings and interlacings—of the palms, of capitals, and, from the forms in beaten gold upon the doors, we may be sure that the relief was low, and the ornament subordinate to the use of the object ornamented. Much of the ornament of the far East, then almost beyond the circle of European civilization, may have been derived from this source. And when Rome emigrated to Constantinople, and, the emperors of the East adopting Christianity, sought to build the temple of Santa Sophia in a style that should widely differ from heathen architecture, a union was effected of ornamentation derived from the East with the degraded forms of Western architecture.

No such gradually increasing civilization, no such Divine inspiration, ushered in the succeeding style, which, arising after the destruction of Classic Art in the West, received its impulse from Christianity stirring the vigorous imaginations of the Northmen, and which, gradually superseding the spread of Art from Byzantium, and passing through one or two marked phases, reached its zenith in the Early Decorated period of Gothic Art. Here we have the utmost grace of proportion, and the most perfect fitness of the ornament. The Gothic artist made lavish use of natural forms, selecting such as should harmonize best with the objects he was enriching. He chose the oak, the vine, or the ivy of his native land, and twined it truthfully and lovingly round the graceful bell-cap, or gathered it into varied groups and clusters in his finials, not strictly imitative, but subdued to the wants and scope of his material. He enriched his walls with diapers, and covered his floors with encaustic pavements; he made his windows glow with all the colours of the rainbow, and taught the subdued sunlight to wander through the lofty aisles of his cathedrals. Never, perhaps, has Art history contributed more evidences of a thorough spirit of design common to the workers of every material. The iron worker and the mason, the carver and the carpenter, wrought each in his separate sphere and material; and yet the one grand whole—the cathedral or the palace which grew up under their hands—preserved its characteristics of unity and variety—a variety of parts with a perfect whole; and, though what is called Gothic Art abounded more in enrichment than did the Classic, yet, at the best period, that of which I have spoken, ornament was entirely subservient to architectural form and to structural lines, serving to pronounce and enrich, but not to obscure them. But Gothic, like Classic Art, was ruined by the abuse of ornament; slowly, yet steadily, its proportions became debased, its enrichments lost their simplicity, and, when its structural lines and parts were thus obscured, this style also lost its influence on the world.

The decline of Gothic Art was hastened by the advent of the Renaissance—a re-birth, not of the pure forms of Greek architecture, but of those of Rome at its best period. True Gothic Art had never developed itself in Italy as in the more northern countries of Europe, and had always been more or less influenced by degraded classicism. In Northern Italy the Lombards and Goths implanted much of their northern freedom, and introduced a style called Italian Gothic, containing features of marked originality, yet never clearly developing the perpendicular principle—the marked characteristic of Northern Gothic. When Classic Art was revived, it found immediate acceptance in Italy, but the principles of the true Renaissance being confined to the acceptance of Classic examples alone, and in no way favouring an appeal to Nature for original thoughts, it became a style of learning, rather than of feeling and imagination. It ignored originality, and did not even seek to refine and perfect the ornament it borrowed from the past. In England, it resulted in the picturesque but grotesque Tudor style. In France, under the Grande Monarque and his successor, it developed into what is called after them Louis Quatorze and Louis Quinze, remarkable for the endeavour to ignore structural truth, for an effort to avoid symmetry of parts as far as possible, and for the lavish display of burnishing and gilding in the ornamental details—pomp and display ruled instead of purity and simplicity, and, while the laws that regulate these styles are easily perceived, the true designer avoids them as grotesque and misleading, and to be studied only for an insight into the varied treatments of metal and metalized surfaces.

I trust you will excuse the hasty glance I have bestowed upon the history of ornamental design. My object has been, by rehearsing the outlines of the leading historic styles, to draw your attention to the teachings and the warnings they must convey to the student. We have seen how, in all cases, the truest taste was that in which the ornamental was made secondary or subservient to the object to which it was applied; that simplicity of the outlines and of the component parts belongs to the purest periods of all Art, and that, while the Grecian artist tempered Nature to the stern and severe outlines of his temples, and produced the beautiful conventional ornaments we invariably associate with the name of his country, the Gothic artist drew his inspiration directly from Nature, and found that Nature, in her beauteous and manifold forms, accorded best with the flowing curves of his mouldings, and the rich tracery of his cathedrals. We have seen when, in times of luxury and excess, the Romans sought to obtain richness by the lavish use of ornament, that they succeeded only in stifling Art; and we have seen, lastly, when the Gothic artist disregarded the simple rules of fitness which had guided his ancestors in the employment of decoration, he made what should have been one of the chief glories of his Art, the cause of its ruin; and, finally, that a re-birth, if only founded upon precedent and the past, wants that vitality which shall give it a firm hold on the taste and feelings of a different race, and a different age. It would be difficult, nay, I think almost impossible, to draw up a code of rules applicable to all classes of design. All that I can hope to do, within the limits allowed me, is to continue the consideration of those general laws we have already deduced in our *resumé* of historic styles and periods, and to endeavour to supply a few illustrations which may be of use to the Art student and designer.*

WORKS IN PARIS.

WITH French architects and builders the past year was evidently a busy one, if we may judge from the number of public works which were completed during the year. The list includes the following works:—The Universal Exhibition building; the fine church of the Trinity, facing the Chaussée, and the gates of the church of St. Laurent; the mayoralty-houses of the third and fourth arrondissements; the transformation of the Trocadero, the buttes de Chaumont, and the Luxemburg-garden; the Avenues Empereur, Josephine, Jena, and Bosquet; the Magenta, Hanssman, and Philippe Auguste Boulevards, the streets Turbigo, Rennes up to the Vieux Colombier, Monge, Pont-Neuf, Halles, Puebla from the Villette to Charronne, Murillo, and Rembrandt; the barracks of the city, the barracks or hotels of the Staffs of the Paris Guards, and the firemen (*sapeurs pompiers*) on the Boulevard of the Palais de Justice; the leather-market, the market Chabrol, the Roule market, and the great cattle-market of the Petite-Villette; the connecting railroad; the waterworks of the Dhuys; the Hotel des Mines on the Boulevard St. Michael; the places of the Arc-de-Triomphe, Europe, Chateau d'Eau and the Trinité, and that near the Théâtre Francais; the museums of the Archives of the Empire, Pierreponds, and St. Germain-en-Laye; the prison of the Madelonnettes, Rue de la Santé; the lunatic asylum of St. Anne; the Court of Cassation and the Assize Court, and, lastly, a number of schoolhouses.

* To be concluded in our next number.

BUCKINGHAM GATE.

ABOUT a century prior to the ever-memorable year 1666, which saw its complete demolition, Old St. Paul's Cathedral was partially destroyed by fire. The re-erection of the cathedral lagged for want of funds, and a portion of the stone which had been provided for its restoration was "borrowed" by the first Duke of Buckingham, who built with it the now interesting architectural relic of Old London which stands at the bottom of Buckingham-street, Strand. It marks the site of York House, celebrated as having been successively the residence of the archbishops of York, the birthplace of Francis Bacon, and the home of one who, with great truth, has been called "the profligate and time-serving Villiers." The gate was erected in 1626, by Inigo Jones; and we need hardly add that it is the only vestige remaining of the once splendid mansion to which it was the water-gate. Buckingham Gate is executed in rock-work or rustic, in the Italian style of architecture, the material being Portland stone. It is justly regarded as a very tasteful and appropriate structure of its kind. The front of the arch facing the river bears the arms of the Villiers family; and on the north front is inscribed their family motto, "*Fidei coronata cruce*"—the cross is the touchstone of faith. Time, however, has, to a great extent, defaced its outlines, and obliterated its ornamentation. Peter the Great lived in a house (Pepys's) on the site of the last house on the west side of the street. The studio of William Etty, the painter, was in the same street; and who but remembers that Mrs. Crupp, the landlady of David Copperfield, lived in Buckingham-street, Strand? The important works now in progress in connection with the Thames Embankment are at this moment sweeping away Buckingham Gate. What will become of it remains to be seen.—From the "Savage Club Papers" for 1868.

BUCKINGHAM WATER-GATE.

BURTON CHURCH.

THIS curious old church (illustrated in another page) is situated near the lower end of Ullswater, in Westmoreland. The most remarkable feature is the tower, which is in the centre of the church. The lower part is very old—Saxon or Early Norman, and vaulted over below the belfry with a barrel vault composed of a mass of twigs and mortar. The original arches in the tower walls are very small, hardly more than door openings; but in later times lower and wider arches have been inserted in a rude manner, going right through the ancient ones, and giving a very curious appearance to the interior.

AISLE ROOF, PARISH CHURCH, WOLVERHAMPTON.

THIS old perpendicular church is one of the finest and richest in the Midland counties. It has a lofty central tower, and is almost on a cathedral scale. There are galleries to each aisle, lighted by an upper storey of wooden glazed tracery, as shown in our lithographic sketch. Every part of the church is very elaborate, and well worth a visit from the student. It has lately been restored by Mr. Christian.

MARTON VICARAGE.

ONE of our illustrations this week is a view and ground plan of Marton Vicarage, near Ousebburn, Yorkshire, lately erected for the Rev. J. R. Lunn, from designs and plans by Mr. John Ladds, jun., architect. The style may be termed Gothic, freely treated, and the object aimed at has been to get rooms of convenient size and height, well lighted and of plain substantial finish and character, well grouped rather than ornamental. The whole of the external walls are one and a half brick thick, built hollow, with a cavity of 2½in., and the walls are bonded together with Mr. George Jennings's patent vitrified bonding bricks, which have been found to answer admirably, and form very dry and strong work. The exterior is faced with pressed red bricks, interspersed with bands of white bricks. The heads and sills of windows and all stone work are carried out in Burton Leonard stone, and the roofs are covered with slate. The external woodwork is painted, but the internal woodwork is stained and twice varnished. The whole of the buildings have been carried out for the sum of £1,568, by Messrs. John Chambers and Son, of Bishop Monkton, near Ripon, York, builders.

BEDFORD MIDDLE-CLASS COLLEGE.

IN our description which accompanied the engraving of the Bedford Middle-Class College last week, we omitted to supply the references to the plan. They are as follows:—

1 and 2. Schools.
3. Dining hall.
4. Plunge bath.
5. Chapel.
6 and 7. Masters'-rooms.
8, 9, 10, 24, 28. Class rooms.
11, 12. Visitors' and waiting-rooms
13. Secretary's-room.
14. Committee room.
15. Library or class-room.
16, 17. Masters' rooms.
18. Library.
19. Kitchen.
20, 21. Pantry and scullery.
22. Dining room.
23. Drawing-room.
25, 26, 27, 29, 30, 31. Lavatories, box-rooms, and cap-rooms.
32, 33. Boot-room and workshops.
34. Servants' hall.
35, 41, 42. Laundry, drying closets, and washhouse.
39, 40. Serving rooms.
43, 46. Coals and wood.
44, 45. Manservants' bed-rooms.
47. Manservants' sitting-room.
49, 50, 51, 52, 53, 54. Offices, &c.
55. Matron's sitting-room.

BASEMENTS.

1st,
A. Boilers and coals.
B. Engine room.
C. Workshops.
2nd,
A. Stores
B. Potatoe stores.
C. Beer cellar.
3rd,
A. Coals.
B. Store.
C. Beer cellar.

SOCIETY OF ENGINEERS.

THE first meeting for the season of the Society of Engineers was held in Exeter-hall on Monday. Mr. W. H. Lefevre, the retiring president, occupied the chair, and having introduced the new president, Mr. Baldwin Latham, C.E., the latter proceeded to read his inaugural address. After discussing the present state of the railway interest, the electric telegraph question, and the subject of technical education, Mr. Latham next glanced at the state of sanitary science. He remarked that 650 towns were now governed in their sanitary operations by the Public Health Act of 1848, and with great benefit to the various localities. From a table it appeared that in the towns of Banbury, Cardiff, Croydon, Dover, Ely, Leicester, Macclesfield, Merthyr, Newport, Rugby, Salisbury, and Warwick, typhoid fever had been reduced at rates varying from 40 to 75 per cent., and phthisis at rates of from 41 to 49 per cent. Proceeding to examine the case of Croydon as one example in detail, Mr. Latham showed that the sanitary expenditure had been, in the gross, £195,000, and the saving in 13 years as follows:—Funerals (less), £12,195; sickness prevented at £1 each, £60,975; value of labour of persons kept in health, £166,828. Total, £239,998. A most important improvement that had yet to be looked after was sewer ventilation, as it was quite clear that the volume of water poured into a sewer always displaced an equal amount of mephitic air. This fact had been completely overlooked by the constructors of the old sewers. In Croydon the death rate had been under 2 in 1,000 by the construction of the sewers; and in Liverpool, a proverbially unhealthy place, 42 in 1,000. Next to good sewerage was an abundant supply of pure water, and there were various schemes under consideration for procuring a supply of good water for the metropolis.

The premiums for papers read during the year 1867 were presented to Messrs. S. W. Worssam, jun, for his paper on "Mechanical Saws;" A. Rigg, jun., for his paper on "Heavy Guns;" J. Gresham, for his paper on "The Injector;" Ewing Matheson, for his paper on "The Quality of Iron." The following candidates were balloted for, and duly elected, as members—Robert F. Farlie, John Thomas Chappell, Henry Gore, Lieutenant-Colonel Henry Wray, R.E., and George Spencer; as associates—James Knox, Edward Harlock, and C. W. Salmon.

The Lord-Lieutenant of Ireland last week conferred the honour of knighthood on Mr. Charles Lanyon, M.P., President of the Institute of Architects, Ireland. Mr. Lanyon is a member of the firm of Lanyon, Lynn, and Lanyon, architects, Dublin and Belfast. He represents Belfast in Parliament.

BRICKLAYING IN LONDON AND PARIS.

MR. GEORGE HOWELL and MR. JOHN JEFFREY contributed the two papers on bricklaying to the "Reports of Artizans," to which we referred in the two preceding numbers of the BUILDING NEWS. As these papers are full of useful information, we think we cannot do better than give copious extracts from them. Mr. Howell says that, though there are but few brick buildings in Paris, there are a great many bricks used there. He says the internal walls, vaults, arches, &c., in the new wing of the Louvre, and also in that unique building, the New Opera House, are all of brick. This is pretty good evidence that brickwork, for ordinary purposes, will be the cheapest and (both considered together) the best. One other circumstance shows that brickwork has its advantages, viz., that there is a company started in Paris endeavouring to compete, in building operations, by the use of concrete. It is called,

COIGNET'S BETONS AGGLOMERES.

The company consider that they can build cheaper, that the walls occupy less space, and that the entire building is more solid and fireproof. The composition of the beton is as follows:—20 parts sand, 4 parts lime, 1 part Portland cement. I visited the large block of buildings in "Rue de Miroménil" and "Rue de Naples," built by the company with "betons agglomeres," composed as above. The block of buildings is very large, and is seven storeys high. The entire block is composed of this concrete—walls, vaults, stair-treads, and risers, ceilings (or rather between the floors and ceilings—each is covered in with this concrete, slightly springing from slim iron girders), and even the roof. It is, in fact, a fine specimen of the kind of building, and should give the projectors and proprietors satisfaction. The building is certainly fireproof, there being but very little wood to burn throughout the entire block. The floor is composed of very narrow slips, only 3in. wide, with a very few similar slips bedded in the concrete to nail them to. Then there are the doors and window-frames, all of a slight character. The solidity of the building was something remarkable. Not a single crack or fissure could we discover, as the result of settlement or anything else. Yet I consider it the heaviest block of buildings I have ever seen covering the same space of ground. This fact argues in its favour. With regard to their walls occupying a less space, there was no instance of it in this example of their work. The proportions stand as follows:—English brickwork, 2½ bricks; beton, 2ft.—equal; English brickwork, 2 bricks—18in., beton, 20in.; in favour of brickwork, 2in. English work, one brick, or 9in.; beton, 12in.; in favour of brickwork, 3in. In their vaults the beton was thick at the haunches and about 7in. or 8in. at the crown, but in all cases it would equal our 9in. vaults, or two rings of 4½in. each, and in many cases exceed it. Then, with regard to price, a well-known builder and myself went into the figures, and the result was given to the manager on the spot. Their work on the average costs £15 per English rod; we considered that brickwork equal thereto could be done for £11, or at most £12. It is but right here to state, that the company have put forth a statement with figures, of which this is an abstract:—They estimate that in London they can build in beton per metre cube, or rather let us take equivalents in English, 35ft. cube, at the rate of £1 6s. 11d., whilst in brickwork they estimate it would cost in mortar, £1 9s. 2d., or in cement, £1 15s., or in beton, with 1-20th part in cement, £1 10s. 8d. Thus, taking their own figures at a saving of 2s. 3d. in a metre cube, I do not think that they will be able to compete with brickwork; yet, under a variety of circumstances, beton will be most valuable.

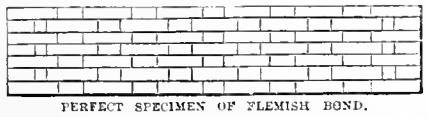
STYLE AND QUALITY OF WORK.

In good brickwork, the first thing to be considered is "bond." There are, properly speaking, but two sorts of bond; one is called "Old English" and the other "Flemish." Old English bond, so called, as it was the only style used in this country up to the time of William III., consists of alternate courses of stretchers and headers; and the Flemish bond, introduced by Flemish workmen who came over with the Flemish king, consists of alternate header and stretcher in the same course. In none of our old buildings will you see Flemish bond.

The English workmen pay great attention to bond, and pride themselves upon its perfection. Many architects and clerks of works select old English bond for heavy buildings, on account of its superior strength. I cannot, of course, deny that its strength might exceed that of the Flemish bond if carried out in all its integrity, but this I affirm, without fear of contradiction, that Flemish bond is equal to every possible and impossible emergency. I defy any architect to point out any one instance of its failure to sustain, without fracture, any superincumbent weight or pressure ever brought to bear upon it. The reason of failure, when any such has taken place, is not the weakness of the style of bond, but the want of bond, by snapping header after header, sometimes for whole courses, in order to save a few front bricks, whether red-rubbers or malms. If the courses are laid regularly and fairly—the headers being properly and constantly placed their whole length in the wall—it cannot fail; I defy it to do so. Nevertheless, the Old English bond should always be used in rough work, inside and outside, as it is a little quicker in practice, and all the "bats" can thereby be used up with facility. And in this there is no fear of failure with regard to strength, as walls never split or separate in the centre; their fractures are generally due to the foundations, for a heavy pier will settle more than a light one, and hence it frequently happens that the fracture takes place through the arches of windows or doors. If I were asked whether the old English bond, or style, cannot be made to look well for front work, I would answer—Yes; but it will always look heavy and confused. It can never have the light appearance of Flemish bond, which I will now examine in all its details, with such examples as I saw in Paris.

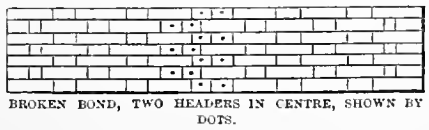
This bond, as I before stated, consists of alternate header and stretcher in the same course. It should be started thus:—First a stretcher, then a header and stretcher, to the end of the piece of wall or pier, always taking care that there be a stretcher at either quoin. (Sometimes this cannot be done in very small piers; the bricklayer will then reverse one of the quoins.) This first course being "run out," start the next course with a header, then a "closer" (a quarter-brick), then a stretcher, &c., till the end of the second course, taking care that both quoins are started alike, as I before pointed out. The following rules should be observed:—1st. If there be any "broken bond," *i.e.*, if in running out your bond you find it does not finish alike at both quoins, then start from each quoin and work to the centre, so that the broken bond, if there be any, may fall in the middle of the pier. Sometimes it will require two headers instead of one; if so, let them follow each other all up the pier until its finish; if you do not, it will detract from the entire piece. Sometimes it will requre three headers, then you will find that it will require two stretchers in the next course, and so on all up the wall. (This is not considered broken bond.) In some instances it will require a three-quarter, but this should at all times be avoided, if possible. Never, under any circumstances, place a closer in the middle, or any other portion of the wall or pier, except at the angles next to the header, as before described. To be partienlar with regard to this, I give the following examples:—

FIG. 1.



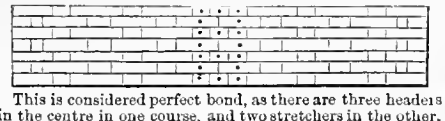
PERFECT SPECIMEN OF FLEMISH BOND.

FIG. 2.



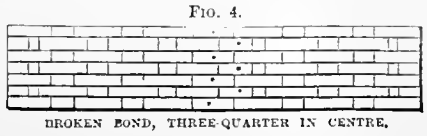
BROKEN BOND, TWO HEADERS IN CENTRE, SHOWN BY DOTS.

FIG. 3.



This is considered perfect bond, as there are three headers in the centre in one course, and two stretchers in the other, as shown by the dots.

FIG. 4.



BROKEN BOND, THREE-QUARTER IN CENTRE.

The beauty of brickwork will very much depend upon the "perpends" being perfectly kept, that is, the perfect regularity of the perpendicular joints right up the building. Stretcher over stretcher should be kept parallel; so also should the broken bond, if any occur. If this be neglected the beauty of the work is entirely destroyed. The work should also be kept upright, and level on the face, the bricks being laid "square" to the line.

I have been thus precise, because I found some of these rules entirely disregarded in Paris. In the first place, the French workmen use a three-quarter at the quoins on the top of the stretcher, instead of a header and closer, as in the examples. Thus the pleasing effect of our quoins in England is entirely lost. I found this rule almost universally broken in Paris.

2nd. If they have broken bond, they seem to be altogether indifferent as to whether it continues parallel with itself up the pier, or whether it be chased from side to side. I shall give some examples of the improper work I saw in Paris, and indicate the proper style, as we should do it in England.

EXAMPLES OF BRICK-BUILDING IN PARIS.

I shall first take some of the buildings on the Champ-de-Mars. There is the Turkish building, with five courses of red Flemish bond, alternate with 15in. blocks of white stone, being equivalent to five courses alternate of red and white. There were three-quarters at all external quoins, and a three-quarter followed by a header at the quoins of all openings. In one pier there was a three-quarters header, stretcher, and a closer, as in fig. 5. It

FIG. 5.

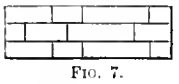


FIG. 6.

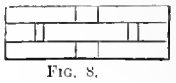

FIG. 7.

FIG. 8.

should have been a stretcher on either side and a header in the centre, with a header and closer in the next course, and a stretcher in the centre, as in fig. 6. Another pier had two headers, one stretcher, and a header, as in fig. 7. It should have been two stretchers and a header, as in fig. 8. In several instances there was what we term chimney-bond—two stretchers and a header, as in fig. 8, when it should have been two stretchers and a header as in fig. 6. One larger pier had header, closer, stretcher, header, stretcher, header, and three-quarter. It should have been header and closer on either side, followed by two stretchers and two headers in the centre. See fig. 2.

Arches of the same building. There were a simple 2in. "camber" on face and soffit, and a large "semi" 14in. face and 25½in. soffit—that is, a brick and half face and two and three-quarters bricks soffit. The face-bond was right; not so the soffit. The long flat arch in the gallery of this building, with two and half bricks soffit, was correct bond; but the piers in support thereof were closer, stretcher, header, and three-quarter, instead of two stretchers, and a header, as in fig. 6. There were six semi-arches, with 18in. soffits, to all of which were wrong bond, being two three-quarters and a header when it should have been two stretchers in one course, and two headers, with closers on either side, and a header in the centre of the next course, &c.

At the entrance of the Catacombes de Rome there was a peculiar arch, constructed on the principle of the trefoil, with three small sub arches and pendants. It was executed in alternate sets of red, white, and black bricks. It looked somewhat tasty, but was essentially weak.

In this criticism on bond, let it not be thought merely a matter of taste, for, even if any person were disposed to question my conclusions as to the appearance of the several piers and arches which have been examined and shown by examples, it still remains a fact that the bond of fig. 2 is stronger than that of fig. 1, 3, or 4.

Chapelle du Parc.—This church presented a very pleasing appearance, and to a non-professional eye would be gratifying and satisfactory. It is built of yellow bricks, with sunk joints, drawn by a thick jointer; has large buttresses, and large Gothic and some small Norman windows. It has an octagon tower on a square base. The arches are coloured red, black, and cream colour. Its fine windows, bas reliefs, and other ornamentations, together with its roof—partly heavy French tiles in different pattern, and specimens of cut slates—make the building, as a whole, look well. But the brickwork is very bad—a no regularity of bond. The openings had been made too large, and patched up with cement 4½in.

and 5in. of a side, coloured and jointed to appear like bricks. It is now cracked away from the brickwork, and shows a straight joint all up the original reveal.

Mr. Howell gives many more instances of brickwork in Paris, and concludes this part of his subject by saying :—Undoubtedly the best specimen of brickwork in Paris is the triumphal arch or "gateway to the front entrance of a mansion," a full-size model, in the outer circle, by George Smith, of London, with terra-cotta dressings, by Blanchard. It has a terra-cotta base: two piers, one on each side, with moulded panels and small cut strings. The centre consists of panels, projections, and mouldings, with terra-cotta facia, frieze, and cornice. The entire piece is a fine specimen of gauge work in Flemish bond, in good red rubbers. Every pier is correct as to bond, as in fig. 1. The bond is preserved in the recesses, set-offs, and angles, whether external or internal. The brick mouldings are well and finely worked. The joints are dipped, and therefore show the workmanship well. It is a credit to the workman who did it, and to the employer who had it done. The arris of the quoins, and the members of the mouldings—quirks, beads, cyma-recta and cyma-reversa, &c., &c.—were as fine as if in marble. Thus the only good specimen was London work. The back part was in old English bond, well kept, and a large two-ring arch.

Mr. Howell gives the following information on prices of brickwork, as quoted :—1st quality, per cubic yard — Solid masses or foundations, £2 11s. 6d.; walls, any height, £2 12s. 8d.; vaults and arches, £2 14s. 2nd quality—Foundations, &c., £2 0s. 3½d.; walls, £2 1s. 7d.; vaults, £2 2s. 9d. Cheapest work—Foundations, £1 2s.; walls, £1 3s. 1d.; vaults, &c., £1 11s. 9½d. The price of bricks varies according to the locality from whence they come; but this is similar to ours—it simply means quality. We have Suffolk whites, Stafford blues, and Ballington reds; also Stourbridge fire-bricks, &c.

Mr. Howell concludes with the following remarks on examples of good brickwork in London: —Good plain gauge-work—No. 82, Piccadilly, the basement of Bridge-house Hotel, the new Sun Fire Office at Charing-cross, gateway and piers of one entrance to Greenwich Hospital, and the grand entrance to Hampton Court. Mouldings—43, St. Martin's-lane (fluted pilasters and cornice), several door-ways in King's Bench-walk and other parts of the Temple, and Old Cromwell House, Hampstead. Machine-moulded bricks—Grosvenor Hotel and other large hotels and stations, particularly on the London, Chatham, and Dover lines. Arches—14, Southampton-street, Strand, the entrance to the Woking Cemetery Station in the Westminster-road; and for groined arches and vaults, the splendid piece of work at the High Level Station at the Crystal Palace. "Tuck-pointing" and good "trowel-work" do not seem much known in Paris.

MR. JEFFREY'S REPORT.

With M. Fouché I visited the concrete houses being built for the Emperor, in the Avenue Daumesnil, the contractor being Mr. Newton, C.E., Chancery-lane. In looking over them I found they are not conveniently constructed. Each house is to accommodate three families, each to have one sitting-room, one bed-room, a kitchen, cellar, and water-closet. A staircase is erected for each three dwellings, and in going up the staircase they will have to pass through the sitting-room and bed-room, to get into the kitchen, which is very awkward. Supposing some one was laying ill in the room, and they wanted to carry anything to the kitchen, they must pass through the other two rooms to get into it, which will be a very great evil; and they must pass through the bed-room to get from the kitchen into the living-room, the bed-room being in the centre. The bed-room and sitting-room are about the same size as the rooms of an English cottage; the kitchen is very narrow. The estimated cost at first was 6,000fr. (£240), not including water and gas. When several of the dwellings were built, the Emperor came to view them. He saw they looked rough and heavy, and he inquired if something could be done to give them a better appearance, and make them more ornamental; and now they are plastering 1½in. of plaster of Paris all over the concrete, and drawing it out to imitate stonework. I am given to understand they will cost now 10,000fr. (£400) each house. It is understood that the Emperor will present them to a society of working men; they being some distance from the centre of Paris, they will be let out at a small rental.

I visited a large house being built of concrete, situate in Rue De Miroménil, No. 98. It has fifteen windows to each storey in front, and has four storeys above the ground floor. The concrete for this house was made in blocks, like stone, and bedded one upon the other with a regular bed; and around the windows and doorways they run the concrete into a mould, to imitate flowers and other devices, similar to stone carving; it has a dull, heavy appearance. It will be very awkward to repair; I cannot see how they can repair it. The building is not admired, nor the system approved of by the French workmen. My opinion is that concrete might do as well as bricks or stone for a cottage or dwelling-house. For a factory, workshop, or other buildings where iron beams, engine gear, steam-pumps, or other fixtures have to be let in the walls, it would not answer; for where there are holes to cut, or the walls to be molested in any way to fix anything to them, I cannot see how they can be made secure, because, when the concrete is once set hard and it is broken, nothing will adhere to it to make it solid and firm like the original.

The men that do the bricklaying in Paris—it being very inferior and requiring no skill—are called limousins. They come from an old province, Le Limousin, now the Département Corrèze. Many of them hold plots of land there, and cultivate them. In the spring, when they can work in Paris, they leave their homes and families to look after this land, and go to Paris. Numbers of them go together. They hire rooms and live together, engage a woman to wash, cook, and look after them. They live cheap, being together; it costs them about 2fr. a day, lodging and all included. They work all the time they can, Sundays as other days, and receive wages for a day of ten hours, 4fr. 50. (3s. 9d.). The labourers' wages are 3fr. There are many young lads, about 15 and 16 years of age, who go up from that province, and they are set to lay the bricks and rough stones in the walls. They are not put apprentices to the trade, but catch it from the others who are more experienced. They are not educated when they first come up: there are night schools which they attend, and receive a very good education, and make great progress. In learning to build walls some become first-class masons (maçons). The first-class mason's wages are 6fr. per day, and sometimes these young limousins become the largest contractors. Some take the laying of stones in the walls by the job, and they are called bardeurs, and their average wages are 5fr. to 5fr. 50c. (4s 2d. to 4s. 7d.) The masons, bricklayers, and labourers, when they have no work, congregate together in the morning, about half-past five o'clock, in front of La Place d'Hotel de Ville (named by the Frenchmen, La Grève), and the employers, when they want any men, go there and hire them, generally taking one limousin and one labourer together. The limousins are very saving; and when the frost sets in, so that they cannot work, they go home with their savings and remain there until the next year, when the work opens again.

In Paris they adopt the system of co operation; that is to say, a number of masons take the masonry work of a large building by contract, and a number of carpenters take the carpenters' work, and other trades the same. Each trade keeps its contracts distinct from the others. The money earned by each trade is equally divided among the men of each trade who so co-operate, so each man is his own master, and earns as much as he can. They work Sundays as other days. They have no day of rest, except once a month. They are paid once a month—the first Saturday in the month—except when the month commences on a Saturday, then the second Saturday in the month. The day after they have received their wages they very seldom work; that is the only rest day they have, except when the weather prevents them from working, and that is where we Englishmen stand above them—we keep our Sunday a day of rest every week.

CATHEDRAL ARRANGEMENT.*

IT seems strange indeed that it should be needful at this time of day to discuss the principles on which an English cathedral church ought to be arranged. Lichfield, Hereford, Llandaff, are facts; they are opened to all the world to go and look at them, if they please. And yet if you speak, especially if you speak to a member of a capitular body, of the simple, natural, and rational arrangements which have been carried out in those three minsters, you are commonly met with a look of blank amazement. People in general, especially deans and canons residentiary, simply do not know what you mean, and seem inclined to set you down as a lunatic for broaching doctrines so strange that they cannot make head or tail of them. The vulgar notion of a cathedral is that it is a church divided into two parts. One part is confessedly intended for divine worship, and into that the congregation is to be crammed how it best may. The other part, commonly the larger of the two, seems to have no certain use; perhaps it was built for the congregation to rub its shoes in before it went into the part intended for worship. Indeed I am not sure that I ought to have said that a cathedral was a church divided into two parts. I once heard it said, perhaps with more practical truth, that a cathedral was not a church, but that it had a church inside it. Anyhow it is held to be the *differentia* of a cathedral that its larger portion should be certainly empty, possibly swept, but on no account garnished. So to be is, if I may quote Greek, the *to li en einas* of the thing. It is what makes it a cathedral, and distinguishes it from any other building which is not a cathedral. Some years ago—things are perhaps better now—I found the small church of Saint Asaph with its nave empty, and its congregation rammed, jammed, crammed into its choir, because, forsooth, it was a cathedral. I was told with great glee in the noble parish church of Grasmont, in Monmouthshire, "Our church is like a cathedral." That is to say, the choir was crammed with pews, and the nave stood empty and desolate. The historical origin of this error is very plain. In monastic churches the accommodation of the ecclesiastical body was everything; the laity were present only on sufferance. If, as often happened, the parish church and the monastic church were under one roof, the parishioners had no rights in the monastic part of the building. They had their own parish church, with nave, choir, and high altar, forming one architectural whole with the church of the monks, but for all legal and ritual purposes distinct from it. The monks, moreover, had to perform constant services, some of them by night. If they found it convenient and comfortable to fence themselves in their choir by high walls and solid screens, they had a perfect right to do so. The laity had a choir and high altar of their own, and they suffered no wrong in being cut off from the choir and high altar of the monks. In parish churches the arrangement was always different. No one ever doubted that the parishioners had a right in the high altar of their parish church. No one ever doubted that the service said in the choir was a service which ought to be audible and intelligible to the congregation. In a parish church therefore, though the choir was always fenced off with a screen, it was a screen which was so light as not seriously to interfere with sight and hearing. Now a cathedral church served by secular canons differs in no way in principle from a parish church. It is not, as ecclesiastical dignitaries would sometimes have one believe, the private chapel of the dean and chapter. It is the church of the bishop and his flock; it is the common church of the diocese, the church where every man living in the diocese is as much at home as in the church of his own parish; it is the great model church of the diocese, the church which ought to set in everything a standard which smaller churches may follow as nearly as their means allow them. It is, therefore, larger, more enriched and served by a more numerous clergy, than other churches. But whatever rules of arrangement apply to the parish church apply to the cathedral church, and *vice versâ*.

Now it happened unhappily for this Church and realm, that several of our cathedral churches came, by a change introduced in the tenth century, to be served by monks, instead of by secular clergy. A cathedral thus served was at once put in a false position as regarded both the bishop and the people. Monks naturally tried to oust both bishop and people as completely as they could. An exaggerated love of corporate independence was characteristic of the times, and the monks carried it to the highest pitch. The example spread to those cathedral churches which were still served by secular clergy. Deans and chapters made themselves as independent as they could, both of the bishop and of the people. The cathedral gradually came to be looked on as their freehold, with which they might deal as they pleased. They gradually deprived the bishop of all direct authority, and reduced him to a mere visitor. Looking on the church as their own, they fenced their

*A paper read at a meeting of the Worcester Diocesan Architectural Society, January 14th, 1868.

choirs in with high walls and solid screens, just as the monks had done. They did thereby, what in a purely monastic church was not done, a distinct wrong to the whole people of the diocese, who ought to have the same access to divine worship in the common church of the diocese as they had in their several parish churches. The solid screens, I need hardly say, were originally built to keep the laity out of the choir. A revolution now occurred which exactly reversed their use. The changes of the 16th century affected the question in many ways. The old rule of the nave for the people, and the choir for the clergy, was no longer strictly observed. Sometimes the clergy invaded the nave; sometimes the people invaded the choir. In the cathedral churches the latter corruption took place. The clergy and choir were in many places no longer enough to fill the choir. Their actual numbers were in many cases reduced. The laxity of residence which had crept into the unreformed Church still remained. Many a stall had no owner, or an owner who never occupied it. At the same time the services now began to be said in the vulgar tongue, and people were naturally more anxious to hear and join in every word. A solid screen is undoubtedly not so great a barrier to hearing the service as people think. One who is familiar with the service can stand in the nave and follow with no great difficulty; but so to do requires one who is familiar with the service. It is no wonder that, when the English services were held, people were anxious to get as near as they could to the clergy. In parish churches the priest often left the choir, and came out to a reading pew in the nave. In cathedral and collegiate churches the laity commonly thronged into the choir, into which the clergy, with their diminished numbers, no longer thought of forbidding their entrance. The solid screens, built to keep the people in the nave and out of the choir, now served to keep them in the choir and out of the nave. The notion gradually spread over men's minds that the choir was the place, not only for the clergy and singers, but for any worshippers whatever, and that the nave was nobody could tell exactly for what. As far as I know, one church alone in England preserved the ancient arrangements down to our own times without yielding to the fashionable corruptions either way. This was the collegiate church of Wimborne Minster. I remember that small but most interesting minster as it stood 20 years back. The choir, raised on steps, fitted with an open screen of the time of James the First, was still occupied by the clergy and choir, while the congregation occupied the nave. The dignity thus given to a church certainly not above the third rank was most striking. One could have wished to get rid of an organ over the screen and of certain pews and galleries in the nave, but all the essential arrangements were there. The demon of restoration has since visited Wimborne as well as other places; he has, indeed, moved away the organ, but, in so doing, he has lowered the steps and carried off the screen and the canopies of the stalls. Such is the taste of the nineteenth century. The nineteenth century, however, if often blind, is often well-intentioned. That our great naves should stand empty has gradually offended people's common sense, and the fact has gradually dawned even upon deans and chapters. The remedy has generally been what is called "service in the nave." That is to say, instead of the people trespassing in the choir, the clergy are set to trespass in the nave. I do not deny that in some minsters this practice may be unavoidable. Churches like York and Canterbury are perhaps too large for the whole space to be made available at once. I say "perhaps," because abroad, in churches like Amiens, whose area cannot be much smaller, the whole of the nave and choir is made available at once. Again, when the solid screen is of very ancient or beautiful work, there will naturally be a strong antiquarian feeling against destroying it. I leave these two classes of cases with a "perhaps." But as to our cathedral churches in general, I say, without the slightest feeling of doubt, as the result of many years' thought and inquiry on the subject, that the right course is neither to cram every congregation into the choir, nor yet to have alternate congregations in the nave and the choir, but to use both at once, the people in the nave, the clergy and singers in the choir, the choir being fenced with a light open screen. No arrangement can be simpler, and yet people seem not to understand what it means. To such persons I can only suggest that Lichfield is accessible by railway, and that Lichfield is now the model church of England. I name Lichfield as a beacon. I may also name Hereford and Llandaff, though there are defects in both. I regret that at Hereford the choir was moved from its ancient position under the tower. I regret that at Llandaff the ancient space of the choir was contracted, and that there was, when I was there last, no screen at all. These two churches then are not so perfect as Lichfield, but all the essentials of a correct arrangement are preserved in them, and where so much has been well done I am not inclined to find fault. I will name two other churches—not as beacons, but as warnings. First comes the cathedral church with which I am most concerned, that of Wells. That minster was unluckily "restored," as it called, a little too soon. It was done before these things were properly understood, under a dean who strangely combined boundless munificence with obstinacy and ignorance. Every kind of savage barbarism was committed: the very monument of the great benefactor, Beckington, was not spared, but, seemingly from sheer wantonness, deprived of its canopy. And on the tomb, not of the benefactor, but of the destroyer, we read, "Multum ei debet Ecclesia Wellensis," a happy adaptation, one would think, of Lucan's address to the kindred destroyer, Nero:—

> Multum Roma tamen debet civilibus armis,
> Quod tibi res acta est.

But among the other enormities done at Wells at that time and since, I have now only to deal with the arrangements of the choir. One must suppose that Dean Jenkyns knew that the nave existed, as he could hardly have got to the choir door without going through it. But he clearly thought that a nave was built to rub shoes in. His only idea was to cram his congregation into the narrow space of a choir and presbytery. It was thought a great feat to move the stalls from the proper place in front of the pillars, and, instead, to stick them between the pillars. Thus the continuous range of stalls and canopies, so glorious at Winchester and Ely, are wholly lost, the stalls being set, four or five together, between the pillars. The miserable effect, the destruction of all harmony and propriety, is easily imagined. Then the stalls, mere articles of furniture after all, are actually made of stone; the way in which the stonework and woodwork are joined together is painfully ludicrous. And it will hardly be believed that, quite lately, instead of there being any movement for destroying these abominations, a large sum has been squandered in enriching their backs with a sort of diaper work, thus recognizing and perpetuating the mischief. Below the stalls, are other stalls allotted to women (who sit, oddly enough, cheek by jowl with the officiating ministers, the priest vicars), and so all the evils of appropriated seats are let in. The less dignified part of the congregation is driven up into the presbytery, to block up the way to the high altar, which is made utterly insignificant, through lack of steps and of proper height in the reredos. The organ, of course, blocks up the eastern arch of the lantern. The whole arrangements are the exact antipodes of Lichfield. The arrangements of Wells are an undying disgrace, as the arrangements of Lichfield are an undying honour, to all who had any hand in either. The effect of these Wells arrangements within the choir speak for themselves. But ever and anon, on certain special occasions, there is "service in the nave." This means that the choir is forsaken. On the very occasions when there is a larger attendance than usual of the canons, it is impossible for them to take their proper stalls, and they are stuck, in a confined hugger-mugger way, in the eastern bays of the nave. The congregation is cut off from the altar, or sometimes, to make the absurdity greater, a sham altar is put up outside the screen. And all this in a small minster where no screen work of any value is left, where there was absolutely no necessity for not forestalling, where there is now no excuse for not imitating, the correct arrangements of Lichfield and Hereford. And yet I have found people who simply could not understand what I meant when I urged the necessity of rendering the nave available. Their only notion of getting more space was—it sounds hardly credible, but such is the case—lengthening the choir to the east, by throwing in the lady chapel, after the barbarous manner of Salisbury. The other case of warning is at Bristol. As the nave of that church, is about to be rebuilt, there is some chance of better things, but at present the arrangements are certainly the most absurd in Christendom. The old nave having vanished, a nave and choir had been made within the remaining space, that of the crossing, the choir, and the lady chapel, the high altar being thrust to the extreme east end. Unluckily the usual plan was followed of cramming the congregation into the choir. By way of reform, the whole of the old fittings have been destroyed, and a glazed screen has been stuck across the eastern lantern arch, cutting off the crossing. The tradition that a cathedral must have some empty space cut off by a screen of some kind thus far survived. East of the screen is the congregation, east of them the clergy, the grotesque thing being that all the ancient traditions of choral arrangement are forsaken, the dean having a throne opposite to that of the bishop! The practical mischief is not so great as at Wells, but the absurdity and grotesqueness of the effect is without a parallel. Now the Dean and Chapter of Worcester have, like Hêraklês, to choose between virtue and vice. They have no such plea about size or the like, such as may possibly be admitted at York or Lincoln. The question lies before them—will they imitate any perverse device like those of Wells or Bristol? or will they have sense, taste, or vigour enough to follow the good examples of Lichfield and Hereford? A great responsibility lies upon them. It is open to them to turn over a new leaf, and to wipe out the memory of their old misdeeds. The destroyers of the Guesten Hall, before all men in England owe a duty to men of taste and knowledge throughout all England. Let the arrangements of Worcester Cathedral be such that the name of the Guesten Hall need never be brought up against them again. Let them make Worcester another Lichfield, and no one will refuse them the friendly greeting which the prophet promises to every returning penitent.

EDWARD A. FREEMAN.

Somerleaze, Wells, January 13, 1868.

THE BUILDERS' BALL.

TO "trip the light fantastic toe" is almost always delightful, even for its own sake; but if in pleasing ourselves we can also manage to please others, the result is doubly satisfactory. We know a way whereby our readers may secure this double satisfaction. Let them attend the Builders' Ball at Willis's Rooms on the 30th inst. If they will, we can promise them, judging from past balls, a large company, beautiful ladies, excellent music, plenty of dancing, and a substantial supper. Considerable benefit results to the charity from this annual ball, the entire superintendence of which is admirably carried out by Mr. Joseph Bird, one of the directors, and who for several years has acted as honorary secretary to the ball. The Builders' Benevolent Institution was commenced in 1847, for the relief of decayed master-builders, &c., and their widows; and have now upon their funds 45 pensioners—25 males, receiving £24 per annum, and 22 females at £20, with a funded stock of £9,150.

NOTICES OF PUBLICATIONS.

"Curiosities of London." By JOHN TIMBS, F.S.A. A new edition, corrected and enlarged: Longmans.

PERHAPS "Curiosities of London" is hardly the most appropriate title to describe this remarkable volume. It is really a cyclopædia of London—a handbook or treasury of reference to the thousand and one objects of interest — buildings, institutions, amusements, laws, manners, customs, and observances—within and connected with the metropolis. Of the great value of the work itself, alike to professional and non-professional men, there can be no doubt. No more reliable or entertaining guide could be named than Mr. Timbs, who can boast of having nearly sixty years' personal recollections of London, and his numerous works of this class testify to the tenacity of his memory, and the greatness of his industry. The present work was originally published in 1855. It has been corrected and enlarged, and the portly volume now before us may be truthfully described as a library in itself. And no mean one either.

"The Savage Club Papers for 1868." Edited by ANDREW HALLIDAY: Tinsley, Brothers.

ONE of the very latest, and one of the very best of our annuals. The work of which this is the second series, consists of contributions in prose, poetry, and pencil, by the members of a well-known *coterie* of authors and artists. The object they have in view is the formation of a fund, to be devoted to the relief of distress in their ranks

when such may happen. The editor, however, is careful to state that "we appeal to no one's charity. There is the book—let it stand upon its own merits." To enable the reader to judge what these merits are it will be sufficient to mention that the volume contains upwards of thirty papers and poems, contributed by G. A. Sala, J. R. Planché, A. Halliday, John Oxenford, Westland Marston, Dion Boucicault, T. W. Robertson, John Hollingshead, Walter Thornbury, James Greenwood, W. Brough, and other well-known light literateurs. Among the artistic productions, those of Gustave Doré, George Cruikshank, Harrison Weir, E. C. Barnes, and J. Palmer, are more particularly worthy of mention. We give one of the illustrations, and an extract from the book, elsewhere. The volume is got up with taste.

"The 'Edina' edition of Burns." Illustrated: W. P. NIMMO, Edinburgh.

UNDER the poetic and very appropriate title of "Edina," Mr. Nimmo has issued an elegant edition of the poems and songs of Scotland's national bard. There have been innumerable editions of Burns, but it would be difficult to produce a more creditably executed work than this. It is illustrated with engravings from original drawings by R. Herdman, Gourlay Steell, John McWhirter, W. M'Taggart, Waller Paton, S. Bough, D. O. Hall, Clark Stanton, and other Scottish artists of distinction; it is admirably printed on toned paper, and handsomely bound in green and gold.

"Haddon Hall." By GEORGE CATTERMOLE: W. Bemrose & Sons, London and Derby. Illustrated.

OF famous English mansions, few are better known or more celebrated than the castellated hall of Haddon. Its embattled turrets, its spacious courtyards, its terraced gardens, its noble banqueting rooms and curious galleries, its fine old domestic chapel, and all its quaintly interesting belongings, together with its picturesque situation on the banks of the Wye, have been lovingly described and dwelt upon by architects and antiquaries times without number. Mr. Cattermole here furnishes an additional account of the history and antiquities of the mansion, the only fault of which is its brevity. The book contains a series of twenty lithographs, from drawings made on the spot. The illustrations consist of exterior and interior views of Haddon, many of which are badly drawn. The lithographer has, in fact, half spoiled his illustrations by overloading them with work.

"Plympton in the Olden Time." By JAMES HINE, F.R.I.B.A.: Keys, Plymouth. 1867.

NOT many persons, barring the dwellers on the Plym, know where Plympton is. Nevertheless, the Devonshire town, so called, is one of the most interesting old world nooks in all England. Plympton may be said to have no recent history—it belongs to the past. Once upon a time, it was a much more significant place than its neighbour Plymouth. Its Norman castle was the residence of the redoubtable Baldwin de Rivers, the second Earl of Devon, and Lord of Plympton; its priory was once the richest and most flourishing in Devon; Sir C. Wren represented the town in parliament in 1685, and was probably the first architect ever returned to the House of Commons; and it gave birth to the greatest of English painters—Sir Joshua Reynolds. "The old grammar-school," remarks Mr. Hine, is the most venerable and interesting school of art in England. Not only was Reynolds educated within its walls, but Northcote, Haydon, and Sir Charles Eastlake were also pupils at this school. This building, which is Gothic, of picturesque design and arrangement, was erected in 1664. An engraving is given of the cloister of the grammar-school, the subject of almost the first drawing Reynolds ever made. We have also illustrations of Plympton Church, two curious old houses with slated fronts, in which the slates have been cut in the shapes of clubs, spades, hearts, and diamonds, and particularly of a fine Norman doorway at the priory, which has engaged shafts on each side, and the chevron ornament carried round the jambs as well as the arch, which latter is formed of alternate voussoirs of grey and green stone. Mr. Hine's little history is well worth perusal.

"Norwich Drainage:" Jarrold & Sons, Printers, Norwich.

THE proposed expenditure of £75,000 (with no guarantee, we are told, that it will not amount to £100,000) upon the drainage of Norwich, is being viewed it appears with "the utmost alarm," by the ratepayers of that venerable but somewhat contentious town. We have before us the memorial of a number of the ratepayers (how many we don't know) to the Board of Health, in favour of what is now known as the earth-sewage system, as against the water-closets and irrigation system. Stated concisely, the argument of the memorialists is that the water-closet system has been attended with serious evils, and that it is doubtful whether the irrigation is not itself rendered noxious and pestilential. They advocate for the other system a fair trial, on the ground that it has been adopted in some public buildings in this country, and has been approved by the Indian government; moreover, that it is *prima facie* consistent with nature. They adduce a large amount of carefully collected evidence to support their argument, and to combat the teachings of Mr. R. Rawlinson, Mr. Latham, and other prominent advocates of water-closets and irrigation. We recommend the evidence to the attention of our readers. The question has become one of pressing public importance, and the Norwich ratepayers have at least a right to be heard.

Building Intelligence.

CHURCHES AND CHAPELS.

A new Baptist Chapel was opened on Wednesday week at Henley-on-Arden. It is built of blue Wilnecote stone, with Bath stone dressings, and will hold 200 persons. The style is Gothic, and it was erected by Messrs. Clarke and Smallwood, contractors, from the designs of Mr. George Ingall, architect, Birmingham.

On Saturday morning a violent gale of wind raged in and about Wells, which has done damage to the beautiful and unrivalled west front of the cathedral, upwards of 300 cwt. of the ornamental work having been blown from the northern tower of the west front.

The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, held its usual monthly meeting on Monday, at the Society's-house, No. 7, Whitehall; the Earl of Romney in the chair. Grants of money were made in aid of the following objects:—Building new churches, viz., St. John the Evangelist, in the district parish of St. Paul, Balls-pond, Islington; St Saviour, Everton, in the parish of Alveley, near Bridgenorth; enlarging or otherwise increasing the accommodation in the churches at Chart Sutton, near Staplehurst; Chrishall, near Royston; Llantrissant, near Newport, Monmouth; Ormsby, near Great Yarmouth; St. Austell, Cornwall; and South Thoresby, near Alford. The society likewise accepted the trust of sums of money as a repair fund for the chapel of Cowgill, in the parish of Sedbergh, York, and for Hanney Church, Berks.

Designs for a limited competition is invited for a new church in Lichfield. The church is intended to be a memorial to the late bishop of the diocese.

St. Michael's and All Angels', Brighton, which was erected three or four years since from designs by Mr. Bodley, is about to be enlarged, we may say reconstructed, under the architectural superintendence of Mr. Wm. Burges.

BUILDINGS.

The crypt beneath Westminster-hall has been redecorated and gilded by Messrs. Crace, of Marylebone.

A company has been started, and a considerable amount of money has been raised, for the purpose of building a pier at Saltburn-by-the-Sea. Contracts for the work have been let to Mr. John Anderson, of Middlesborough, and it is said that the pier will be completed in June next. A landing-place for vessels has long been needed, and when the pier is finished many excursionists from the Tees, the Wear, and the Tyne will have an opportunity of spending a pleasant day at little cost in this really beautiful watering-place.

New cattle-markets are to be constructed at Melton Mowbray, the expense of which will be met by the funds of the "Town Estate." As usual, in almost every work of the kind, great difficulty and difference of opinion exist in respect to the site. It is earnestly hoped that the mistake made by a neighbouring town, viz., of placing it as far as possible from the railway station, will not be repeated in this instance.

A new wing called "the Eyre Crabbe Wing" has been added to the Royal South Hants Infirmary, Southampton, by the widow of Colonel Eyre Crabbe, R.H., an old Peninsular officer, at an expense of £3,600. The building, which was designed by Mr. Crichton, architect, Southampton, consists of a set of store-rooms on the basement floor, above which are two wards, each affording space for eighteen beds. The wards are built on the most approved principles of hospital construction, the floors being of oak, and the walls and ceilings of Parian, which gives a polished non-absorbent surface.

The new Town-hall for the Pendleton district of Salford borough is nearly finished. The building is situated at the corner of Broad-street and Broughton-road, and has, from its commanding and open position, a very pleasing effect. It is built in the Italian style of architecture, and is from the designs of Mr. Alfred Darbyshire, of this city, the contractors being Messrs. Cochrane, Parker, and Co., also of this city. The probable cost will be from £8,000 to £10,000.

WATER SUPPLY AND SANITARY MATTERS.

In fourteen districts of the Madras presidency, says Mr. Jacob, there are 43,000 irrigation reservoirs now in operation; 10,000 more have fallen into disuse. The embankments, by which their waters are retained in hollows, valleys, and combes, average half a mile in length. One dam now broken is 30 miles long, and encloses an area of from sixty to eighty square miles.

The town of Alford, in Lincolnshire, which should, from its position, be one of the healthiest in the kingdom, is, from the prevalence of dirt, and want of drainage and good sanitary measures, scarcely ever free from contagious disorders. Some of the leading inhabitants succeeded a short time back in forming a local board, only, however, to encounter the most obstinate opposition from the town's people. Scurrilous handbills, containing gross personalities, have been widely circulated, personal violence threatened, and hundreds of pounds, diverted from their proper object of benefiting the town, have been uselessly spent in legal proceedings. A correspondent says some of the respectable inhabitants are leaving the place, and trade is becoming seriously injured.

Dr. Letheby's annual report on the sanitary condition of the city of London has just been presented to the Commissioners of Sewers. That portion of it which relates to the cholera epidemic of 1866 is extremely valuable. Dr. Letheby considers that the water theory, as to the production of disease by choleraic pollution, is disproved by the facts he adduces. He says the native home of the cholera is the swampy and low-lying districts of India, and, in its visitations to this and other countries, it always follows the lines of traffic. In 1867 the city of London appears to have had an exceedingly low death rate, and to have been exceptionally healthy.

In order that no delay may take place in the carrying out of the works at Sefton Park, Liverpool, the council met specially on Wednesday for the purpose of accepting a tender for executing sewerage, excavating rock, and other works. Several tenders have been received, and the improvement committee have recommended the council to accept that of Mr. S. Campbell for £72,345. The work will be immediately proceeded with.

Mr. Tidd Pratt, in a paper which he has just issued from his office, states that he is almost every day receiving complaints from persons who cannot obtain payment of their claims from burial societies, and he calls upon the public press, clergymen, and others to endeavour to prevent the working classes from joining burial societies established under the Friendly Societies' Acts without first ascertaining that they are joining solvent institutions. There is reason to believe that considerable misapprehension exists among a large section of the public as to the purport of Mr. Tidd Pratt's certificate, which it is so common to see quoted as if it were a guarantee of the soundness of a society. It should, therefore, be understood that he is bound to certify the rules of a society if they are not illegal, and that his certificate as to the sufficiency of the contributions does not in any way vouch for the solvency of the society, or the respectability of the trustees, treasurer, or officers, or that the money will be paid on the death of the party insured.

TO CORRESPONDENTS.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

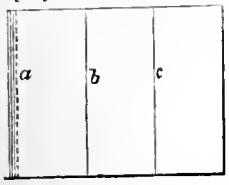
Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p m on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

SIR,—In binding the BUILDING NEWS how should the illustrations be placed, as binding them in double would destroy the whole sheet engravings? Would you kindly inform me of the best method?—ANXIOUS.

[Any ordinary bookbinder can insert the double sheets in the volume without injuring them. He has only to give each sheet an extra fold. Let the following diagram represent the sheet. The shaded part is stitched in between the leaves: *b* and *c* represent the folds. Let the fold *c* fall on the dotted line *a* and the thing is done.



E. W. PUGIN's letter too late.

W. H. S.—You will find some of the information asked for in "Photographs from Sketches," by Augustus Welby Pugin, published by Ayling, Oxford street.

MR. W. BURGES writes to say that, on account of pressing professional duties, he has been unable to send the second article on "Art Workmanship at the Society of Arts."

TURNERS' YELLOW.—An oxychloride of lead has been manufactured under this name, by heating together salammonia.

Correspondence.

ARTIZANS' REPORTS.

To the Editor of the BUILDING NEWS.

SIR,—I note that of the money raised for sending English workmen to Paris, a portion has been employed, as usual in these matters, in sending Germans. In the BUILDING NEWS last week, p. 22, I find our great English trade of watchmaking, in which we hold a high rank, represented by Hermann F. Jung, silver-work by P. A. Rasmussen, bookbinding by Louis Genth.—I am, &c.,

D. Y.

[Has not our correspondent found something like a mare's nest? There are hundreds of men born and bred in this country who inherit German and French names, but who are, nevertheless, excellent English citizens. Those mentioned above evidently possess considerable ability, and write the English language well; and we see no reason why they should not be selected by the Society of Arts to report on artizan-work at the Paris Exhibition. In fact, we see good reason that they should be selected, supposing them to be competent men and able to speak French, as in all probability they can.]

PREVENTION OF FIRES IN THEATRES.

SIR,—A communication in your journal for the 3rd of January, from a correspondent signed B., has induced me to address you upon the above-named subject, which has occupied my thoughts at various times for several years. Having had opportunities in former years of becoming acquainted with the general construction and arrangement of several of the metropolitan theatres—previous to their destruction by fire—and from what I have observed, I fear that all theatres, as generally constructed, are doomed at some time or other to the same fate—destruction by fire. The remarks of your correspondent B. are very applicable to the purpose stated, and I believe many provisions have been made for the same purpose; but, in my opinion, the great and principal precaution should be in the construction of the theatre at first, which, if well studied and carried out, although it might not prevent fire or make a theatre fireproof, might do so to a great extent, and thereby prevent the fire from spreading so rapidly, and causing such entire destruction as hitherto. The destruction of a theatre by fire, and its prevention by the manner of construction, as well as the several appliances for extinguishing the fire, has, I believe, been frequently discussed, and various arrangements proposed; but I do not remember any proposition for a more general use of iron as a principal material in the construction of the interior of a theatre, in place of the great amount of timber and woodwork generally used, which, with the great quantity of other inflammable matter, is, as your correspondent B. states, so easily ignited, and converts the interior of a theatre into a body similar to a well laid preparation for a fire in an ordinary grate that only requires the match to be applied, or, in the case of a theatre, an unobserved spark, the result being a sudden and powerful conflagration, which the best contrivances and arrangements have hitherto been unable to check or to overcome, destroying in a few hours all that had so recently been so valuable and beautiful. This has led me to think that, if a more general and judicious use and combination of wrought and cast-iron was used in the several parts of the construction of a theatre, very much of the destruction and loss would be prevented. For the walls and other parts of a theatre, good sound brick masonry, wherever it can be used, must be considered the best material, as shown by the remains of Her Majesty's Theatre.

The manner in which iron is used in the construction of the roofs of the principle railway-stations at their London termini suggests, I think, the way it might be applied in the formation of a roof to a theatre, and by the proper arrangement of the several parts to suit the purposes required, might be made the means of sustaining the usual amount of flooring for painting-rooms and shops. The framing of the necessary machinery, flies, &c., all of which might be formed more or less of iron, also parts of the framing for carrying the wings, might be composed of rolled angle or T iron, especially those parts most exposed to the action of the wing lights, thereby doing away with the necessity of covering those parts usually formed of wood with plates of tin to avoid ignition.

The principal girders, joists, framing, and supports of the stage might also be formed of rolled and boiler-plate iron, giving more strength, in less space than wood.

The principal flaps, falls, slides, and grooves, might be formed of plate iron, covered with boards, to correspond with the floor of the stage. Iron framing might also be introduced into, and form parts of, the fronts, floors, partitions, doors, supports, &c., of the audience portion of the theatre, the decorated surfaces being formed by carton pierre or other varieties of similar material for ornamentation, drapery, looking-glass, &c., attached to the frame, also much of the ornamentation in relief, sunk and perforated panelling, mouldings, &c., might be formed of iron.

Where the floors of the several passages, corridors, &c., could not be formed of arched masonry, they might, as well as the floors of the saloons, dressing, and other rooms, be constructed in the manner and of the materials known as Fox and Barrett's, or others, the upper surfaces being laid with ornamental tiles, stone, or wood, as required. Any apertures or doorways only occasionally required to be open, might be closed by Clark's or other iron shutters. Iron shutters or curtains have, I believe, been applied to shut off the stage from the audience.

The halls, approaches, and stairs would necessarily be formed of masonry, or a combination of iron, and might be so arranged as to be separated from any parts of the building where fire might occur, and thus remain uninjured. By the means herein suggested, many parts of the theatre would become separate compartments, so that a fire occurring to the drapery, furniture, &c., in one or more of these compartments, might be checked before communicating with other parts, and, as I have before stated, be prevented from spreading so rapidly as it usually does. It may be objected that I have suggested the use of iron too freely, and that the expansion or contraction would be a serious obstacle; but I apprehend that the advanced scientific knowledge of the nature and properties of iron, and its application in large quantities, as shown by the works and constructions of our principal engineers, would enable any of our eminent architects to construct such a building as I have shadowed out.—I am, &c., W. C. J. WEST.

33, Percy-street, Bedford-square, W.

DARLINGTON WORKHOUSE COMPETITION.

SIR,—It was well you headed the observations on the above competitions "communicated," for it is far from being fair and impartial. There are some very good plans and some very neat and suitable elevations, but the competition seems very likely to prove as very many others before it—"unsatisfactory;" and, if this is a specimen of others, I am not surprised at the constant complaints from the architectural profession. It is notorious here that every underhand influence is being used by some local competitors to secure the prize, notwithstanding the "worry" which your correspondent foresees, three having sent either pamphlets or circulars to the several guardians and those most likely to influence them, headed, "What a Workhouse should be," &c., and which, of course, explains their design. In addition to some of the competitors "haunting the place," their friends are constantly there—one newly elected councilman, elated no doubt by his recent "victory," wishes to set every one right, and, having one favourite in whom he is much interested, is to be found in all sorts of positions explaining the merits of this particular design to all comers, especially any stray guardian—at the same time artfully stabbing each of the others in its turn.

It is observable, also, that several of the competitors have deliberately violated the "conditions," both as to scale and colour. The scale was to be one-eighth, but some are very much less than that. The perspectives were to be in outline only, or etched with the pen, but some are highly coloured. This ought not to be allowed. It is proposed that a professional gentleman should be engaged to select the three required. This seems the only way now to mend matters. If he is a suitable and honourable man, and the guardians abide by his decision, justice may yet be done, and a great scandal removed from the town. What, Sir, is the remedy for all this constant complaint? I think that, if competitors themselves would be honourable, much might be saved, and that, if the committees would generally employ an unbiassed professional man, possessing a fair share of ability and common sense, they might save themselves much unjust imputation.

LOOKER-ON.

LONDON ORPHAN ASYLUM COMPETITION.

SIR,—In your remarks upon the late competition for the London Orphan Asylum at Watford you state that the third premium was awarded to a "Mr. Webster." I shall be obliged if you will kindly correct this, as I had the honour of receiving that distinction. It is not for me to discuss the particular question you propose, but I should be rejoiced to do anything towards placing architectural competition on an honourable footing, one half the evils of which are created by those upon whom the whole recoil.—I am, &c.,

THOMAS H. WATSON.

9, Nottingham-place, W., January 23.

REBUILDING ST. ANDREW'S, HERTFORD.

SIR,—I enclose the conditions to architects for the St. Andrew's Church Competition, at Hertford, advertised in last week's BUILDING NEWS. If you could find it a corner I would be obliged. It shows what a "remarkable nerve" the committee have.—I am, &c., ALFRED W. PHILLIPS.

5, Offa-street, Bedford, January 22.

Materials.—Left to judgment of Competitors. Bricks of all kinds, also flint, can be had in the neighbourhood.

Cost.—The old materials of present structure, except such parts as belong to and are connected with the tower, will be given, in addition to £3,000.

Accommodation for six hundred sittings, of which from seventy-five to one hundred must be for children.

Tower.—The new work must be properly connected with this; but the design can propose rebuilding of the same, or its removal to another position.

Site should be visited by every competitor, as the old church and tower is at present standing thereon. No block plan, therefore, will be sent.

Payment will not be made by the committee for any of the drawings, specifications, correspondence, travelling expenses, postal or other charges connected with this competition.

Architect.—The committee are not to be canvassed, since it is their intention to select (if any) that design which in all respects is the most worthy of merit; and on satisfactory references being given, it is their intention to employ the successful competitor as architect, on the usual terms. CHARLES N. WILLIAMS, M.A., Hon. Sec.

January, 1868.

Petroleum is said to have been discovered at Broseley, Shropshire, while sinking a shaft in a field.

Intercommunication.

QUESTIONS.

[716.]—HOW TO ASCERTAIN TRANSVERSE STRAIN You would oblige by informing me the lengths of bearing usually adopted when ascertaining the amount of transverse strain any such substance, as a bar of iron, &c., will bear.—R. N. Y.

[717.]—RED PINE GIRDER.—Will you, or any of your numerous correspondents, oblige me with a formula for ascertaining the breaking weight of a red pine girder, with ½in. wrought-iron flitch in middle of ditto (as per sketch),

Wrought-iron length bolted to timber.

if bearing is 14ft. in clear? According to Hurst, an ordinary beam of this size breaks with 784cwt. on the middle, and with the introduction of the wrought-iron flitches, at 700 cwt., which I do not think can be correct.—DEVONPORT.

[718.]—CONCRETE.—1. Does the Building Act permit houses to be built of concrete? 2. Is concrete as durable as brickwork? If not, what is the relative durability of the one to the other? I infer, from the silence of the champions of concrete on the subject of its durability, that they have nothing to say on that head that will be to its advantage.—C. T. S.

[719.]—COMPOSITION ORNAMENTS FOR PICTURE-FRAMES, AND ORNAMENTAL MOULDINGS, &c.—Can any of your readers give me a good receipt for the above?—D. G. M.

[720.]—LINSEED OIL AND TURPENTINE.—How can I, in a simple way, ascertain whether linseed oil and turpentine are adulterated?—W. W.

[721.]—VARNISH FOR PIPES.—I should be glad if some one would give me some information as to the constituent ingredients of Dr. A. Smith's varnish for pipes, and how it is applied.—J. H. H.

[721.]—PUGIN TRAVELLING STUDENTSHIP.—I would feel much obliged if any of your readers could afford the information concerning the Pugin Travelling Studentship, when vacancies occur, necessary qualifications, &c Also if there will soon be an opening.—CELT.

[Our correspondent is informed that intending competitors for the Pugin Travelling Studentship are required to send in the necessary drawings to the rooms of the Institute of British Architects (9, Conduit street, Hanover-square), on or before Friday next the 31st inst. Carriage and all expenses must be paid. Any further information on the subject "Celt" may obtain by applying to Mr. C. L. Eastlake, the assistant secretary of the Institute.]

[722.]—IRON MINIUM PAINT.—Can any correspondent inform me where this description of paint is produced? I want to know whether it can be applied to wood as well as iron for preserving purposes.—C. C.

[723.]—AN ARCHITECT.—If an architect employs a quantity surveyor and take a portion of the money for the quantities, and if there should be a deficiency, can the architect be made responsible to the builder?—A. A.

[724.]—SMOKY CHIMNEYS.—I shall be obliged if you will inform me whether strong winds affect the draught of wide or narrow chimneys most; also whether you would consider 10in. diameter a sufficient size for a common kitchen chimney?—R. B.

[It is a common mistake among builders to make the chimney too small. The area of a chimney should be too large rather than too small, because it can be readily reduced to any desired size by means of a sliding register plate near its bottom or a damper plate applied to the top, adjustable by wires or chains passing over pulleys. Wide chimneys are not so liable as narrow ones to have their draught affected by strong winds. Besides, if the common open range is used, the current air through a small chimney is not sufficient to take away the smoke, and an oppressive atmosphere is the consequence. In a kitchen chimney of less than 6in. in diameter, cooking operations could be scarcely carried on. The capacity ought to be considerably larger.]

[725.]—FLOATING BRICKS.—It would much oblige a student of the "Intercommunication" if some of your readers would give me some information as to the strength and manufacture of floating bricks.—S. M.

[Floating bricks are a very ancient invention, being mentioned by Pliny. The earth with which modern floating bricks are made was discovered by M. Fabroni, and is called fossil meal. It is abundant in Tuscany and in the territories of Sienna. According to the analysis of M. Fabroni, it consists of 55 parts of silicious earth, 15 of magnesia, 14 of water, 12 of alumina, 3 of lime, and one of iron. It exhales an argillaceous odour, and when sprinkled with water throws out a light whitish smoke. It is infusible in the fire, and, though it loses about ¼th part of its weight, its bulk is scarcely diminished. Bricks composed of this substance, either baked or unbaked, float in water; and 1-20th part of clay may be added to their composition without taking away their property of swimming. These bricks resist water, unite perfectly with lime, are subject to no alteration from heat or cold, and the baked differ from the unbaked only in the sonorous quality, which they have acquired from the fire. Compared with common bricks their strength is little inferior, and much greater in proportion to their weight. A floating brick masonry, 7in. × 4½in. × 1in in 8 lines, was found to weigh only 14½ ozs. whereas a common brick weighed 5lb. 6¾ oz.]

REPLIES.

[715.]—ROYAL ARMS.—I think there is no liability incurred in issuing a descriptive card or advertisement headed by the Royal Arms, if nothing is contained therein tending to lead the public to believe that the article advertised is protected by a patent. An Act of Parliament passed for the prevention of fraudulent trade and other marks, forbids the placing of any mark on any manufactured article with such intent (unless, of course, patented), under a penalty of £5, but I do not think it could touch "F. K." for merely using the arms as an ornamental heading.—P. A. T.

WAGES MOVEMENT.

The threatened strike in the building trade at Chesterfield appears likely to be averted.

Trade is very dull at Bristol, and as yet little prospect of any change for the better, as very few works of any magnitude are anticipated for the present year.

A strike is at present existing in Newcastle-on-Tyne in the wood-working trade, although not connected with the building trades. The coopers assert that the masters are endeavouring to reduce their wages, and, the masters not yielding, the strike is the consequence.

STATUES, MEMORIALS, ETC.

The statue of the late Sir Robert Peel is now placed in New Palace-yard, Westminster, but it is not yet decided when it is to be uncovered.

A monumental brass has just been executed in St. Margaret's Church, Westminster, to the memory of William Whateley, one of Her Majesty's consuls, and formerly a churchwarden of St. Margaret's parish. The brass is inlaid with coloured marble, and was executed by Mr. T. Gaffin, the sculptor of the Quadrant, Regent-street.

In addition to the marble statues of William III and James I., lately placed by the side of the members' entrance to the House of Commons in Westminster Hall, a statue of Charles I. is now placed there. The marble statue of George IV. has not yet been placed on its allotted pedestal, the statue of that King now placed in the hall being a plaster model.

LEGAL INTELLIGENCE.

A DANGEROUS BUILDING.—Mr. F. H. Caiger, surveyor in the Dangerous Buildings Department at Scotland-yard, applied to Mr. Maude for a peremptory order to eject a family from a house in Church-place, Greenwich, the continuing to remain therein being considered dangerous to the lives of such inmates. It appeared that some time since an order was served upon the landlord to put the property in repair. No notice, however, had been taken of such notice, and recently an adjoining house had been pulled down, the consequence of which had been to occasion the falling of the back wall of the house in question. Fortunately this occured at a time when the family was out of the house, otherwise loss of life must have occurred; but possession was still retained, the holders refusing to leave, saying they had nowhere else to go to. It was altogether dangerous that they should be allowed to remain any longer, as the house might at any moment fall. Mr. Maude at once signed the necessary order, which was placed in the hands of one of the warrant officers of the court to execute, with instructions, if necessary, to remove the occupants to the workhouse.

BREACH OF AGREEMENT.—WILKINS V. BELL AND ANOTHER.—The plaintiff brought this action at Nisi Prius against a firm of land agents and surveyors at Charing-cross, for breach of agreement in not teaching his son their business, and not paying him the prescribed salary. In November, 1866, the young man was apprenticed to the defendants for three years, the father paying a premium of £100, and they undertaking to pay him a salary of £50 for the first year, with an increase of £10 yearly for the rest of the period. He remained with defendants until last December, when he left, in consequence, as he said, of not obtaining payment of his salary, and the allegation was, that during the greater part of the time he was employed in going errands, and in other ways which did not enable him to acquire a knowledge of the business carried on by defendants. He admitted to having refused to obey the instructions of the defendants on certain occasions, but, on an intimation by the learned judge that such misconduct did not relieve the defendants from liability, he parties agreed to a verdict being returned for the plaintiff, with £100 damages, on the understanding that the indentures were to be cancelled.

MEETINGS FOR THE WEEK.

TUES.—Institute of Civil Engineers. "On the Relation of Fresh Water Floods of Rivers to the Areas and Physical Features of their Basins," by Colonel P. L. O'Connell, Assoc. Inst. C.E., 8.

THURS.—Inventors' Institute. "On Economic Apparatus for Ensuring the Combustion of Fuel, whether used for Manufacturing or Domestic Purposes," by M. J. risbie, to be followed by discussion, 7.30.

SAT.—Associated Arts Institute, "On the Relation of Art to Ethnology," by R. H. S. Smith, M.A., F.S.A.

Our Office Table.

The German obituary of 1867 includes the names of Professor Sohn, the eminent portrait painter, and Professor Cauer, the elegant sculptor, in addition to those we gave the other week.

A curious medal is to be sold at Paris in a few days. The lead of which it is composed was a portion of that used to rivet the chains of the Bastile. On one side is a representation of the taking of the Bastile, and the date July 14, 1789. On the reverse is an inscription, of which the following is a translation:—"This lead sealed the chains which chained the victims of despotism, and recalls the period of liberty conquered in the year 1789."

We have seen some new specimens of stencil-plates manufactured by Messrs. Berkeley and Co. particularly suitable for expediting lettering on plans. The metal is prepared on Muntz's principle, which makes it so malleable that it is almost indestructible, with fair using. The front part of the lettering, &c., is bevelled (by a process of acid), which causes the plates to lie perfectly close to the surface of the paper, and prevents the possibility of the ink spreading or blotting under the plates when being used, at the same time enabling an person to produce with ordinary Indian ink an accurate impression equalling very fine hand-work. The plates are inexpensive, and by the use of alphabets, a title, with 100 words, can be produced in twenty minutes.

It was stated at an adjourned meeting which was held on Friday for the purpose of establishing a Co-operative Building Company on the plans lately laid down by Mr. A. Walton, architect, of Cardiff, that nearly 500 members had joined the movement, the great majority being from the masons and painters. From the reports given in, it was estimated that 5,000 shares of £1 each would be taken up in a few weeks, and that the company would be prepared to undertake building operations in March next.

The experiments in Paris with the new system of gas-lighting invented by MM. Marechal and Tessier du Mottray continue to be made with the most satisfactory results. At the request of the Emperor, the private apartments at the Tuileries were illuminated by means of their apparatus, and nothing it is said could have been more successful. It now appears that the discovery is more or less due to the intelligence of an Englishman, Mr. Drummond, who one evening making use of hydro-oxygen gas, happened to throw into the flame a piece of common white chalk with which he had been drawing on a blackboard. The heat was so intense that the chalk became a mass of light, which shone like the sun. It is the reproduction of this very light which astonished the crowd on the Place de l'Hotel de Ville, and which has so delighted the Emperor. While on the subject of gas, we may mention that in accordance with instructions received from the Secretary of State for War, some important trials in connection with its consumption, and which promise to be of great advantage to the public, have just been completed at the gasworks of the Royal Arsenal, Woolwich. It has been found that by combining bitumen with coal in gas retorts that the gas is evolved with great rapidity, and that it gives an illuminating power from one burner equal to twenty-five sperm-acetti candles. The experiments have been so satisfactory that 200 tons of bitumen have been ordered by the War Department for use in the Arsenal.

At a meeting of the Society of Scottish Antiquaries, last week, Mr. Stuart, the secretary, read a paper by Mr. Henry Laing, on the Carved and Heraldic Shields of the Apartment in Holyrood House known as Queen Mary's Audience Chamber. The paper was illustrated by a large drawing in colours. After alluding to the art of carving in oak, especially in ecclesiastical decoration, as seen in the chapel of King's College, Aberdeen, and in the Cathedral of Old-Machar there, both of which is very rich in this kind of ornamentation, Mr. Laing gave the details of the shields on the ceiling of Holyrood. One of the shields is that of Henry II. of France, and it is placed immediately over the shield of his son Francis, the Dauphin. As the latter ceased to be Dauphin in July, 1559, the date of the work must have been in or before that month.

The Belgian Academy of Sciences and Arts offer a premium of 1000 fr. (£40) for the best inquiry respecting the period at which the architecture in the Low Countries was affected by Italian influence, with indications of the persons to whom such influence is attributable, and citations of works in illustration of the same.

The interior of the official residence of the Lord Mayor has for some weeks past been undergoing a costly and elaborate process of decoration under the direction of the city architect, Mr. Horace Jones As we stated some time ago, the Commo n Council at the suggestion of the Lord Mayor, voted upwards of £2,000 for the purpose, and the work will probably not be completed until the end of February. The money is being chiefly expended in the embellishment of the Egyptian Hall and the saloon.

In consequence of considerable inconvenience having arisen to the public from unauthorized persons in the neighbourhood of Westminster Abbey assuming the character of guides, and thus misleading and exacting money from visitors under the pretence of showing them the precincts and the entrance to the church, we are requested to warn the public against all such persons, and to state that the north door of the abbey is always open on week-days from 7.45 a.m. till dusk, and on Sundays, for the services, both this door and that by Poet's-corner. On week days the latter door is closed for the present, in consequence of the works for the restoration of the chapter-house close by.

The Dean and Chapter of Carlisle are making some alterations in the approaches to the Cathedral in that city, one of the alterations being the widening of the footpath leading to the main entrance. To effect this improvement, it was necessary to level some of the graves, and certain parties being of opinion that this was a desecration appealed to the Chancellor of the diocese, who has in the meantime stopped the progress of the work, until a proper plan be furnished.

The Vicar of Leamington has raised the question of the liability of a contractor for the use of a churchyard in carrying out work connected with a church. In building the south transept of the parish church a portion of the churchyard is occupied by workmen, and the vicar, who had stood aloof (the work being done under a faculty by a Church Completion Committtee), new claims of the contractor £20 for one year's occupation, and has officially notified that he shall proceed against him for the recovery of a fine of 40s. per day, so long as he continues to use the churchyard without paying for it while completing the parish church. The singular demand has created some local interest.

The arbitration as to the strip of land required by the Liverpool Corporation for town improvements, to be taken from St. Peter's churchyard, was closed yesterday by an award of £5,500 as the value of the land.

The exhibition of the Society of Femalo Artists (9, Conduit-street) will open on Monday, the 27th inst., and the General Exhibition of Water-Colour Drawings, at the Dudley Gallery, on the 3rd of February.

Mr. J. R. Longford, writing from the Engineer's Office, Manchester and Sheffield Railway, says that our statement on page 860, No. 675, in relation to the train going on the railway bridge over the Niagara Falls "without the engine," is incorrect. He speaks from personal experience.

The rapid progress made in the construction of the new Blackfriars' Bridge, contrasts very favourably with the almost proverbial slowness hitherto attendant on bridge building. The four piers are now virtually completed, and two out of the five iron arches are placed and nearly finished. The centre arch will have a span of 185ft., the two immediately adjoining a span of 175ft. each, and the two shore arches 155ft. each. The total length of the bridge will be 960ft., and the breadth 80ft., nearly double that of the old bridge. The gradient of the whole bridge will be only 1 in 40; the rise in the old bridge was 1 in 22. The whole outlay will be about £320,000, or about £4 per superficial foot. Another year will see the completion of the work—indeed, on an emergency, it might be used as a thoroughfare for foot passengers as early as June or July next.

The vestry of Marylebone having advertised for a vestry clerk at a salary of £2 10s. a week, about 30 persons applied for the situation. Mr. S. Ford was selected.

Trade News.

TENDERS.

ARROW.—For alterations and additions at Cambridge Lodge, Arrow. Mr. J. H. Rowley, architect:—

Woodbridge	£650
Crabbe and Vaughan	636
Shurmur	565
Sharpington and Cole	555
Nightingale	543
Salter	490
Fole	475
Chapman	445

BAYSWATER.—For alterations and additions to No. 29, Porchester-terrace. Mr. Charles Innes, architect:—

Fish	£1,280
Macey	1,232

BRIGHTON.—For Turkish bath. Messrs. Goulty and Gibbins, architects. Quantities supplied by Mr. J. Chester, Lansdown:—

Patman & Fotheringham	£8,697
Lockyer	8,555
Piper and Wheeler	8,500
Nightingale	7,533
Chappell	7,470
Hall	7,363
Cheesman (accepted)	7,263
J. Sawyer	6,953

CITY.—For alterations and additions to warehouse, Monkwell-street. Mr. H. H. Collins, architect:—

Sale	£543
Cohen	478
Pearse	381

DOVER.—For two houses, for Mr. S. Finnis. Quantities supplied:—

Fagge	£3,367 0
Davis	3,175 0
Featherstone and Co.	2,976 0
Adcock	2,962 18
Cozens, Brothers	2,950 0
Tunbridge	2,840 0
Stiff and Co. (accepted)	2,780 0

KILMORE.—For building Kilmore Church, Co. Down. Mr T. Drew, architect:—

	Church.	Spire.	Total.
M'Laughlin & Harvey	£3,368	£719 14 10	£4,087 14 10
Lowry & Son	—	—	3,732 0 0
Freeman	3,090	620 0 0	3,710 0 0
M'Gaughey	2,999	651 0 0	3,650 0 0
Murphy	2,950	530 0 0	3,530 0 0
Doolin	2,937	525 0 0	3,462 0 0

LONDON.—For erecting warehouse in Idol-lane, for Messrs. Smith, Harrison, and Crossfield. Messrs. John Young and Son, architects:—

Jackson and Shaw	£9,500
Ashby and Sons	9,450
Mansfield and Price	9,308
Browne and Robinson	9,124
Henshaw	9,050
Ashby and Horner	8,840
Conder	8,475

ST. PANCRAS.—For building dispensary, St. Pancras. Messrs. Goulty and Gibbins, architects:—

Collings	£1,627
Lovatt	1,602
Sawyer	1,576
Abbott	1,520
Staines and Co.	1,497
Sheffield	1,489
Lathey, Brothers	1,487
Outcheson and Walker	1,447
Palmer	1,446
Nutt and Co.	1,407
Thomas and Son	1,399
Newman and Mann	1,395
Brass	1,381
Sharpington and Cole	1,375
Crokett	1,350
R. Mann	1,345
Scrivener and White (accepted)	1,341
Nightingale	1,333
Perkins (withdrawn)	1,197

WAPPING.—For the erection of a public-house. Mr. C. Dunch, architect:—

Moreland and Burton	£2,280
Newman and Mann	2,156
Kilby	2,115
Hill and Keddell	2,090
Piper and Wheeler	2,069
Hearle	2,055
Ennor	1,964
H. and J. Johnston	1,912

WEST COWES.—For the erection of a villa residence, for Mrs. Venning. Mr. Francis Newman, architect. Quantities supplied:—

Chinchen	£1,474 0 0
Wheeler	1,464 0 0
Cooper and Dyer	1,450 10 9
Sibley	1,427 0 0
Denham	1,399 0 0
Thomas	1,379 0 0
Barton	1,360 0 0
Ball (accepted)	1,348 4 0

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Thomas Adams, Ore, Sussex, builder, February 4, at 11—Henry Hughes, Hanover-street, Carlton-road, Kentish-town, builder, January 29, at 12—William Nicolls, Robertsbridge, builder, January 29, at 11 Charles Henry Clothier, Woolwich, builder, February 3, at 12.

TO SURRENDER IN THE COUNTRY.

Thomas Allen, Buckingham, brick and tile manufacturer, January 28, at 11—Alfred Clark, Hinton St. George, Somerset, carpenter, January 25, at 11—William Jelly, Salford, plasterer, Jan. 28, at 11—Thomas Lewtas, Blackpool, brickmaker, Jan 29, at 1—John Hargreaves Milnes, Leeds, plumber, February 3, at 12—Edwin Parkin, Sheffield, joiner, January 27, at 1—John Stafford, jun., Leeds, blue slater, February 3, at 12—Thomas Cox Stretton, Old Basford, builder, Feb. 4, at 11—Edward Tompson, Chorlton-upon-Medlock, timber dealer, January 28, at 11—Thomas Webster, Eccleston, near Prescott, builder, January 28, at 11—Charles King, Bristol, mason, February 7, at 12—John Smith and John Lawson Ibbotson, Barrow-in-Furness joiners, February 6, at 10.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

February 28, W. Brooks, Clarendon-road, Notting hill, builder—January 23, J. Barritt, Luton, builder—February 3, G. M Nichols, Leeds, bricklayer—February 6, A. Callard, Honiton, builder—E. Horrex, Bury St. Edmunds, builder—February 14, M. Gladwell, Rougham, plumber—February 20, R. Basley, Ipswich, paperhanger—February 11, H. H. Strick, Stafford street, Lisson-grove, carpenter—February 10, W. Verrier, Bishop's Lydiard, builder—February 10, I. Kirkbride, Carlisle, mason—March 18, T. Weeks, Winton, Hants, bricklayer.

PARTNERSHIPS DISSOLVED.

Henderson and Co., Newark-upon-Trent, engineers—Duff and Howlett, Tothill street, builders—Harrison and Co, Hyde and Audenshaw, brickmakers—Turnpenny and Anderson, Bradford, Yorkshire, joiners—Potter and Spriggs, Rhyl-street, Kentish-town, builders—Osborne and Ashworth, Bradford, Yorkshire, plumbers.

DECLARATIONS OF DIVIDENDS.

G. F. Tildesley, Willenhall, iron merchant, div. 1s. 5¼d.—J. S. Branch, Liverpool, lime burner, div. 1¾d.—P. Anley, Whitecross-street, builder, div. 1 11-16d.—W. Flint, Church-street, Stoke Newington, builder, div. 2s. 6d.—S. Proctor, Chesterton, near Newcastle-under-Lyme, builder, div. 2s. 10d.

DIVIDEND.

February 3, J. Lawson, Leeds, blue slater.

BANKRUPTCY ANNULLED.

William Townsend, St. Mary Cray, Kent, builder, January 18.

ANNUAL PUBLICATIONS
FOR ENGINEERS, ARCHITECTS, AND SCIENTIFIC MEN IN GENERAL.

1.

Now ready, roan tuck, gilt edges, price 6s. (postage 4d.),

WEALE'S ENGINEERS, ARCHITECTS, and CONTRACTORS' POCKET-BOOK for 1868. Considerably improved, with many additions, and eight copper plates.

"Always correct when consulted." "English Mechanic"
"Its interest does not end with the year."—"Builder."

2.

Now ready, 12mo, strongly bound, price 4s. (postage 4d.),

WEALE'S BUILDERS and CONTRACTORS' PRICE BOOK for 1868, revised by G. R. BURNELL, Esq., C.E. This book is the universally recognised arbitrator in the settlement of disputed accounts.

"We'll done and reliable. . . . It is the duty of the critic to point out where improvement can be made on any work, but Mr. Burnell seems to have anticipated all objections."—"English Mechanic."

"We cordially recommend its use, especially in all cases of misunderstanding, or where revised prices have been or can be agreed to before work has been commenced." "Builder."

3

Now ready, on a large sheet for hanging, price 2s.; or folded in cloth cover, for the desk or pocket, 2s. 6d. (postage 2d.),

THE ENGINEERS and ARCHITECTS' OFFICE SHEET and ALMANACK for 1868; containing Memoranda relating to Standing Orders, Railway Construction Regulations, Mensuration, Data and Formulæ for Wrought-iron Girders, Steam Engines, Railways, Cranes, Roofs, Mill Gearing, Hydraulics, Weight of Iron, &c.

"Here are 48 well-filled pages of that kind of matter which is in most constant reference by engineers and contractors . . . . . Its character may be expressed by a comparison with 'Molesworth's Pocket-book,' if spread out upon a single sheet."—"Engineering."

Nearly ready, for 1868, fcap., 5s. each (postage 4d.), with fine Portrait of Sir S. Baker, and Vignette of the Albert Hall.

THE YEAR-BOOK of FACTS in SCIENCE and ART, Exhibiting the most important Discoveries of the past year in Mechanics and the Useful Arts, Natural Philosophy, Electricity, Chemistry, Zoology and Botany, Geology and Mineralogy, Meteorology and Astronomy. By JOHN TIMBS, F.S.A.

"A correct exponent of scientific progress. . . . . A record of abiding interest."—"Mechanics' Magazine."

*** As an inducement to new Subscribers, sets of the work from 1861 to 1868, with an extra vol. in 1862 (9 vols. in all, each containing a steel portrait or photograph) will be supplied for 35s., post free.

5.

In preparation, Imperial 4to, illustrated by 36 Double Plates, drawn to a large scale, and Photographic Portrait of John Fowler, Esq. President of the Institution of Civil Engineers, price £3 3s., half morocco; a new volume (1866) of Mr. Humber's

RECORD of the PROGRESS of MODERN ENGINEERING.

"No engineer, architect, or contractor should fail to preserve these records. . . . No student in the profession but should carefully study these details of great works, which he may be one day called upon to imitate."—"Mechanics' Magazine."

*** The volumes of the above work for 1863, 1864, and 1865, are on sale, price £3 3s. each.

London: Longwood and Co., 7, Stationers' Hall-court, E.C.

In the Press, New Engineering Work, demy 8vo, cloth 29s., Subscribers until February 1, 18s.,

ON WATERWORKS, SEWERAGE, IRRIGATION, TRAVERSE SURVEYING, &c.—The Second Volume of Engineering Fieldwork. By W. DAVIS HASKOLL, C.E.

London: ATCHLEY and Co., Engineering Publishers.

ATCHLEY'S NEW BUILDERS' PRICE BOOK, 1868, cloth, 4s., now ready containing present prices of material and labour, by a staff of practical men. "The Union of True Construction with Good Taste," by an Architect. Post free, 51 stamps. 106, Great Russell-street.

GOTHIC FORMS APPLIED TO FURNITURE, METAL WORK, &c., for INTERIOR PURPOSES, by Mr. B. J. TALBERT, of London. The above work has especial reference to the Manufacturers of Furniture, Metal Workers, and Decorators, as suggestive of Work applied to Buildings erected in the Gothic Styles. The sketches will be designs adapted to the modern requirements of the library, dining, drawing and bed rooms, halls, &c.; this includes wood, metal, and decorative work. To be published in six monthly parts, price 5s. per part, containing five plates and letterpress; or when completed, bound up, £1 15s.

Published by S. BIRBECK, Bookseller, 3, Pershore-road, Edgbaston, Birmingham.

WESTGATE, by Margate.—VALUABLE FREEHOLD BUILDING LAND on the sea coast to be LET on LEASE, or SOLD in Plots. Excellent brick earth and chalk on the estate. Capital sites for villas, with any quantity of land; 55 acres are already let. Advances made. Plans and particulars of Charles N. Beazley, architect, 96, Guildford street, W.C.

BRICKFIELD to be LET on LEASE (about four acres of land), in Essex, within twelve miles of London.—Apply to G. W. Abbott, Esq., solicitor, 6, Whitehall, S.W.

CRYSTAL PALACE. — FIRST-CLASS BUILDING LAND to be LET in immediate proximity to the Palace, on advantageous terms. For particulars apply to Mr. Hart, Accountant's Office, Crystal Palace; or to R. R. Banks, Esq., 1, Westminster Chambers, Victoria-street, Westminster.

FREEHOLD LAND at Upper Tooting, Wandsworth-common, and Beddington to be LET or SOLD, for the erection of villas and shops; and at Peckham, on LEASE, for small houses.—Apply to Herbert Taylor, Architect, 14, Queen-street, Cheapside, E.C.

MORTGAGES.—SUMS of any amount, ranging from £200 to £50,000, ready to be advanced for various periods, at from 4 to 6 per cent, on MORTGAGE of Freehold or Leasehold PROPERTY.—Apply to Messrs. Bellias and Merchant, public accountants, 6, Martin's-lane, Cannon-street, E.C.

MORTGAGE MONIES.—HENRY SALTER and Company, Mortgage Brokers, 11, Parsons-lane, E.C., undertake the arrangement of mortgages, on bonded estates or house property, at the lowest current rates.

FOR SALE, a Schiele's 20-in. WHEEL TURBINE, with throttle valve, bell-mouthed inlet, and adjustment to half power. The above is new, and not now required. Will be Sold a bargain.—For further particulars, apply to James Mackenzie, 43, Cannon-street, London, E.C.

CAUTION.—BLAKE'S PATENT STONE BREAKER.—IN CHANCERY.—"BLAKE v. ARCHER." November 12, 1867.—His Honour the Vice-Chancellor Wood, having found a verdict in favour of the plaintiffs in the above cause, establishing the validity of Blake's Patent, and made a decree for an injunction to restrain the defendants, Messrs. Thomas Archer and Son, of Dunston Engine Works, near Gateshead-on-Tyne, from infringing such patent, and ordering them to pay to the plaintiffs the costs of the suit, all persons are hereby cautioned against manufacturing, selling, or using any stone breakers similar to Blake's, which have not been manufactured by the plaintiffs. Application will forthwith be made to the Court of Chancery for injunctions against all persons who may be found infringing Blake's Patent after this notice.—Sole maker in England, H. R. MARSDEN, Soho Foundry, Meadow-lane, Leeds.

MOULE'S WARMING APPARATUS.—The Best and most Economical System of Warming Churches, Schools, Hothouses, and all large buildings.—Apply to J. W. Girdlestone, C.E., 31, Duke-street, Westminster, S.W.

ARCHITECTURAL ENRICHMENTS in PAPIER MACHE, CARTON PIERRE, and COMPOSITION, produced in the best style; and estimates furnished on receipt of drawings. Established 80 years. WILLIAM SMART, 41, Chiltern-street, Finsbury, London, E.C.

TO CONTRACTORS, BUILDERS, MASONS, SCULPTORS and OTHERS.—E. R. PAYNE, Forest of Dean Stone Quarries, Clearwell, near Coleford, begs to inform the trade that his new STEAM SAW-MILLS, adjoining the Railway at PARKEND, are now in FULL OPERATION; and that he can supply, on short notice, any quantity of BLOCK or CONVERTED BLUE and GREY FOREST of DEAN STONE of the very best quality, at low prices, sawn fit for rubbing.

GOUT and RHEUMATISM.—The excruciating pain of Gout or Rheumatism is quickly relieved and cured in a few days by that celebrated medicine, BLAIR'S GOUT and RHEUMATIC PILLS.

They require no restraint of diet or confinement during their use and are certain to prevent the disease attacking any vital part.

Sold by all Medicine Vendors, at 1s. 1½d. and 2s. 9d. per box or obtained through any Chemist.

CARTS, LADDERS, BARROWS, &c.—GEORGE ELL and CO., Builders of Carts, Vans, Waggons Trucks, Trolleys, &c., Contractors' and Builders' Plant.

LADDERS, BARROWS, TRESTLES, STEPS, PORTABLE SCAFFOLDS, PICK-HELVES, HAMMER HANDLES, &c.

Wheels made by Improved Machinery on the Premises.

A large Variety of both Light and Heavy Wheels kept in Stock.

Barrows, Dublin, and other Carts, intended for Exportation, are made by Machinery so as to be interchangeable in their parts.

Dublin Carts, £9; Brick Carts, £15; Navie Barrows, 10s. 6d.

Scaffolding, Ladders, Barrows, Trestles, Step, &c., Lent on Hire.

Price Lists on application.

GEORGE ELL & CO.,
EUSTON WORKS, 366 and 368, EUSTON ROAD, LONDON, N.W

GILT ROOM BORDERING.

3-in. OG, 6s. per 100 feet; 5 OG, 7s.; 1 in. OG, 10s. 6d.

EVERY DESCRIPTION of PICTURE FRAMES and MOULDINGS kept on Stock, at the Lowest Prices. Regilding to the Trade.

At GEORGE REES'S, 57, Drury Lane.

WHY PAY RENT?

THE ARTIZANS, LABOURERS', and GENERAL DWELLINGS COMPANY (Limited).

Established under the Companies' Act, 1862.

Capital, £250,000, in 25,000 Shares of £10 each.

Deposit, 10s. per Share on application, and 10s. on allotment.

PRESIDENT.—The DEAN of WESTMINSTER.

ARBITRATORS.

The Right Hon. Earl of Shaftesbury, K.G. | Lord Elcho, M.P.
The Right Hon. Earl of Lichfield | Mr. William Thompson
Mr. David M'Gregor
Mr. James Fletcher

BANKERS.—National Bank (Charing-cross).

SOLICITORS.—Messrs. Lumley and Kent, 5, Cecil-street, Strand.

SECRETARY.—Mr William Swindlehurst.

CHIEF OFFICES.—147, Strand, London W.C.

This Company is specially formed to assist the working classes to obtain improved dwellings from the best designs, at the lowest possible cost, upon the co-operative principle.

THE PURCHASE OF A HOUSE.—See Prospectus.

No Solicitor's or Surveyor's Fees are charged. A Fixed Rate of Interest of 5 per cent. is charged upon Purchase-money upon the Property erected by the Company.

No Beershop, Inn, or Tavern shall at any time be erected on any property of the Company.

Further information may be obtained at the Office. Prospectuses sent by the Secretary, on receipt of a letter enclosing a postage stamp.

ACTIVE AGENTS WANTED.

WHITTINGTON LIFE ASSURANCE COMPANY.

CHIEF OFFICE: 37, MOORGATE-STREET, LONDON.

BRANCH OFFICE: 59, PICCADILLY, MANCHESTER.

MODERATE RATES of Premiums—especially for young lives.
BONUSES have been declared in 1860, 1863, and 1866.
POLICIES made payable during life-time
INVALID AND SECOND-CLASS LIVES insured on a new principle.

ALFRED T. BOWSER, Manager.

ROYAL POLYTECHNIC.—A WONDROUS CHRISTMAS SHILLINGSWORTH.—MAHOMET'S COFFIN FLOATING IN THE AIR.—SPIRITUAL MANIFESTATIONS, à la Home, daily presented in Professor Pepper's Original Entertainment, founded on FARADAY'S RESEARCHES, distinguishing pure Science from the unreal, as exemplified in the pretended manifestations.—The pathetic Story of THE BABES IN THE WOOD, with Optical effects; recited by Mr. Danner Cape.—Matthews's Modern Magic.—The Indian Juggler, Ingwar.—CLERKENWELL EXPLOSION photographed by V. Heath.—Amusing VENTRILOQUISM by Maddle. Cavalho.—EXPLORATION OF ABYSSINIA, by Thomas Baines, Esq.—Paris Exhibition; Machine-made Jewellery shewn by Mr. Edwin W. Streeter, Conduit Street.—The Automatic Leotard.—Open from 12 to 5 and 7 to 10.

UNDER THE PATRONAGE OF H.M. THE QUEEN.

THE LONDON PARQUETRY WORKS,—The first Establishment founded in England (in 1842) for the exclusive manufacture of Solid and Plated PARQUET FLOORS and BORDERS, CEILINGS, and WALL DECORATIONS; and Sole Patentees of the only system adapted to the English climate, whereby the evils of DRY ROT, SHRINKAGE, and WARPING (so common to work manufactured in foreign climates), are EFFECTUALLY PREVENTED.—For designs, estimates, and list of nearly 300 floors, &c., apply to THE LONDON PARQUETRY WORKS, Grove-lane, Camberwell, S.; or to their Sole Agents, Messrs. Gillow and Co., 176, Oxford-street.

THE IMPROVED REGISTER
Gravel, Sand, Coal, or Lime Screen.

In this Screen the *thin* lacing wires, so liable to wear out, are entirely dispensed with. It is made of strong wires wrapped round the iron cross-bars, so that the meshes cannot be displaced nor wear loose.

CAN BE MADE TO ANY MESH.

Size in wire	2ft. 4 in. wide.	4ft. 2in. deep.	Price £1 10s. 0d.

THE INTERNATIONAL PRIZE MEDAL,
AWARDED 1862,
ALSO THE DUBLIN MEDAL, 1865.

To BUILDERS, CARPENTERS, and BLINDMAKERS

JAS. AUSTIN & SON,

Manufacturers of the above Articles, particularly wish to direct the attention of the Trade to their

IMPERIAL PATENT FLAX SASH LINES,

Of which they are now making four qualities, and they strongly recommend that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which Article has neither the STRENGTH nor DURABILITY of FLAX, consequently cannot give so much satisfaction to the Consumer. They also invite the particular attention of Upholsterers and Blind Makers to their Improved Patent Blind Lines, which are very much superior to anything yet offered to the trade.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses in Town and Country.

ESTABLISHED 1774.

BY MAJESTY'S LETTERS  HER ROYAL PATENT.

Austin's New (1867) Imperial Patent
SUPERFINE FLAX SASH LINES.

JAMES AUSTIN and SON in introducing the above NEW and SUPERFINE SASH LINE would recommend it by its superiority in the following particulars, viz.: It does not stretch or kink, and from its peculiarity of manufacture cannot be frayed by the friction of the sash-pulleys and weights.

This article has been patented, and they feel assured that it will only require to be known to ensure its immediate adoption by the trade. It can be obtained of all Ropemakers, Ironmongers, Merchants Factors, and Wholesale Houses Town or Country.

ESTABLISHED 1774.

November 1, 1867.

THE BUILDING NEWS.

LONDON, FRIDAY, JANUARY 31, 1868.

MR. FERGUSSON ON THE PRINCIPLES OF RESTORATION.

MR. FERGUSSON, from the time he has devoted himself to architecture, has been distinguished by a boldness and originality of treatment; and this even in a branch of architectural study—restoration—which in many cases is nothing more than a mechanical pursuit, that may be called compilation. Our day has been fortunate in possessing a large school of writers and professors of art, who are not dependent on the professional pursuit of art. We say this is an advantage, because, when a man once becomes interested in the active practice of his profession, he seldom has time to carry out to his own satisfaction a course of research and investigation demanding long time and protracted attention. The chief literary labours of Cockerell, Professor Donaldson, and Falkener, were carried out in the earlier part of their lives, and, notwithstanding subsequent contributions, their after labours have been partial, or only the development of their previous studies. It is, therefore, an advantage when such men, for instance, as Ruskin, Beresford Hope, Browne Willis, and Richard St. John Tyrwhitt, can be enrolled in the art-army to devote to it their chief time, or their more disposable leisure. Fergusson unites the advantages of the amateur and the professional man: of the professional man, in a sufficient conversance and practice in architecture to bring him within strictly professional allegiance; and of a freedom of devotion which allows him to bestow on his favourite art all requisite duties of ministration. Thus he has rendered essential service, not only in the way in which he has made philosophy and history illustrate architecture, but by his own artistic instinct in the treatment of construction and of detail. He may be said greatly to have extended the range of architecture, not only by illustrating its place in the systems of history and philosophy, but by many other services. Notwithstanding all that was effected by his predecessors, he may be considered as the real introducer of Indian architecture into England, a mission to which he is still devoted. His restorations of the monuments of Assyria, of the buildings of Jerusalem, of the Mausoleum, and of the mode of lighting Greek temples, have not been barren scholastic treatises. Whatever may be the absolute truth in these cases—and we differ from Mr. Fergusson in more than one instance—they constitute a positive contribution to the resources of art, and many of the suggestions, ingenious and practical, have been adopted, altogether apart from their immediate appropriation.

Restoration is a copious subject. There is the restoration of a Gothic church in nature by the architect, with or without regard to the data before him, and there is controversy enough on these matters. What may be classical or antiquarian restoration is another form of the subject, and that we have in hand now. It may refer to plan or to construction, but both are much connected. Where the whole or the greater number of the bases of the columns are *in situ*, the restoration is a simple labour—we have a plan with the defined remains in black, and have only to fill in the deficiencies in outline, and cannot go far wrong. This is not a work greatly taxing the powers, and is little above paste and scissors performance.

It is, however, not so when we have fewer ill-defined fragments, materials in confusion, or no materials at all, and only scanty historic indications to guide us. Then it is that noble exercises for architects are obtained—contests in which the public interest is readily excited, and where there is the valuable privilege of choosing one's side. What a pity it will be if the Junius controversy can be solved by indubitably attributing the authorship to Francis or any one else! What such controversies are in literature are the controversies as to restorations in architecture. It will be a great pleasure to find the site of the Temple of Diana at Ephesus; but, if, which is not very likely, sufficient fragments are discovered, it will be a loss to those who back either the views of Professor Donaldson or Mr. Falkener as to the columniation of the temple. We expect no such issue can affect those of our readers who have made up their minds in favour of Mr. Fergusson himself, or of Mr. R. Poppleton Pullan, as to the restoration of the Mausoleum. Restoration is, in its nature, subject for controversy, because, after all, we can only arrive at relative, and not at absolute truth. Mr. Fergusson has been involved in several of these controversies, and an attack on the restorations of Nineveh and Persepolis, made by Professor Rawlinson, in the fourth volume of his "Five Ancient Monarchies of the Eastern World," has driven Mr. Fergusson to a personal defence in the "Fortnightly Review," which, though seen by some of our readers, can hardly receive the attention of all.

He first lays down his principles of restoration, on which we will not now comment, though we think they will form matter of discussion. He says:—

> Before, however, proceeding to discuss these, it may be well to state briefly the principles which have guided me in every restoration I have ever made, and which lie, as it seems to me, at the root of the question.
>
> First—Any restoration to be correct must be conformable with the principles of common sense; or, in other words, must result in the form best suited to meet the requirements of the purposes for which the building was designed.
>
> Since the erection of St. Peter's at Rome, architects have so generally neglected this rule, that we have almost forgotten its existence. We were so accustomed to see architects putting up Grecian Doric porticoes before churches, jails, panoramas, or private houses, that it never occurs to us to ask what purpose they were intended to serve. And we now see Gothic towers, and castles, and mansions, erected with all the accessories of monasticism or of mediæval warfare, and we never think of asking how far they are suited to modern enlightenment, or to Snider rifles and Armstrong guns. But before the sixteenth century, I assert absolutely and without fear of contradiction, that no such puerilities were committed; and if any restoration does not result in the most practically convenient design that the mechanical knowledge of its builders could invent, or that the materials at their command would admit of—reject it at once.
>
> A second principle is that every ancient building must form part of a gradually developed series. Whatever may be true of Darwin's theory as applied to Nature's laws, it is absolutely true of all man's architectural works anterior to the sixteenth century. Every building was developed, according to certain well-established principles, out of some preceding one, and, if a restoration will not fit into the series—reject it.
>
> As a corollary to this, every building erected in the same age and at the same place, and for the same purpose, is practically identical, *mutatis mutandis*, with all the others.
>
> A third principle is that, if the building were erected for ornamental purposes, and your restoration turn out a deformity—pause. This rule, however, is the most difficult of application of the three, because it may happen that the means available do not suffice to enable a restorer to form a definite opinion as to what the people of that country and age may have thought beautiful or otherwise, and in all instances it requires very considerable familiarity with a new style before we can feel sure that we are in a position to judge of it æsthetically.

Mr. Fergusson says that it was upon these principles he first proceeded to the restoration of the Assyrian palaces. He found one building older than them, and of the same class, sufficiently described. This was Solomon's House of the Cedars of Lebanon, of which our readers have Mr. Fergusson's sketch-restoration in his "History of Architecture," No. 145, in the first edition, and No. 97 in the new edition. Although this appears to be only 75ft. wide, it was constructed with three rows of cedar pillars to support the roof. At the other end of the series, he found the palaces of Susa and Persepolis crowded with four and six rows of pillars on their floors.

These pillars he considered to have been developed out of wood, and that in earlier edifices the Assyrians might have used pillars, and those of wood. Mr. Fergusson seems to have been most guided by considerations of climate and of the constructions suitable to it, considerations which are not likely to weigh with Professor Rawlinson, at Oxford, in his snug apartments, in the same way as they do with those who are habituated to the climate of Asia.

Mr. Fergusson very naturally thought that the light could not be introduced through openings in the roof. It is to be noticed that even in modern domed buildings where this is done, the light is sparingly introduced through small orifices, and then at such a height as not to affect the shade and coolness of the lower portions of the buildings. He further considered that the excavations proved that it had not been introduced through the lower part of the walls; while an examination of the plans showed that there was no difficulty in introducing a sufficiency of light between the walls and the roof, in such a way as to exclude both the sunshine and the rain, hence the proposition of that mode of roofing, which may be found in detail in Mr. Fergusson's works, and which has been assailed violently by the Professor. What Professor Rawlinson chiefly relies on is the assertion that no bases of pillars have been found within the apartments, nor any marks on the brick floors of such pillars, or of the pressure of the pillars. He says, too, that stone pillar bases have been found in wide doorways. Mr. Fergusson joins issue with the Professor as to the alleged pillar bases in the doorways having been employed to bear wooden pillars, for he says these would have slipped.

Before going further into Mr. Fergusson's case, we may refer to what the Professor supports as alternatives in opposition, namely, the hypæthral, as proposed for Greek temples, and the spanning of the area by beams, from which he says archæologists have hitherto shrunk. This is not unnatural, for the beam theory can obtain no support under the circumstances. As to the hypæthral theory, it has also little weight, for the buildings would have been next to useless in such a climate. Mr. Fergusson observes that the builders first raised a mound of loose earth, above 30ft. high. We think it quite possible, however, that the mounds may have been of earth prepared in the usual way, cut into the shape of bricks or tiles when wet, and applied when dry, which would have given a harder foundation, and labour was not a consideration, as it was a forced contribution. Mr. Fergusson says loose earth, on which they placed great moundlike walls, averaging from 15ft. to 20ft. thickness, and arranged them so that the area of the solids, as represented by the walls, should be as nearly as possible equal to the voids forming the rooms, and they did not carry these walls above the height of 20ft. Such a mass might rest in equilibrio, but the tendency, he considers, if any, would be for the floor to rise. To counteract this, he suggests, that, after being carefully beaten, a common process, the floors were paved, and that on the pavement woolen shoes were placed, circular in form, according to the Persepolitan examples, and extending over a considerable surface of the pavement. Into these shoes the wooden pillars were shipped, and by them the heavy roof was supported. Such a system would be in perfect equilibrium, and would last for ever, until disturbed by decay, or some such accident as the fire to which he attributes the destruction of all those palaces: but it would not, after such an accident, show any bases, or marks of them on the pavement.

Our readers will see that, according to this view, the wooden structure was to a great degree independent of the walls. We are rather surprised that Mr. Fergusson has not noticed

that this system of construction, of having the timber framing separate from the walls, is still to be found in Asia, but the chief reason assigned for its adoption is as a security against earthquakes, so that the timbers are not even bonded to the walls. One very curious thing we have seen is that in a building, say a two-story house, the roof has been put on before a wall has been raised.

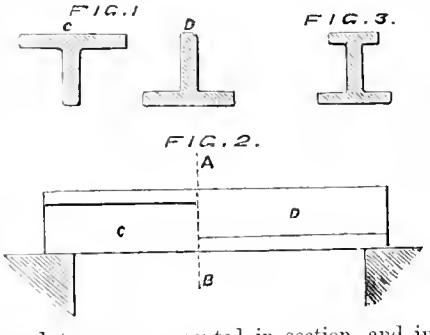
So far as to the restorations of Nineveh. Of the Chehil Minar we cannot now speak, but we will lay before our readers Mr. Fergusson's last words on the hypæthral theory :—

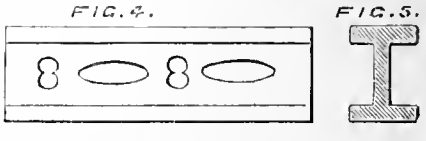
The hypæthral suggestion may require a little more consideration, not from its superior applicability to the present question, but because of the collateral issues it involves. For twenty years I have been trying to put this fallacy right. It is dying, but slowly; and it is only by continual reiteration that its end can be hastened. Like the Druidical origin of Stonehenge and the primæval antiquity of Silbury Hill, the hypæthron has become a matter of faith. Those who believe in it are not any longer required to give any reasons for the faith that is in them, but are allowed to consider that they have proved their case, if they can point out any flaw or deficiency in their opponent's argument. In vain I have challenged the production of a single specimen of this strange contrivance, either ancient or modern, as existing in any part of the world. Except the Pantheon at Rome, where the difficulties of the vault forces it on the architect, and in two, it may be three, Roman decastyle temples, which possessed internal courts, that may be so called, I do not know of any examples. It does not exist in Roman houses, as Mr. Rawlinson asserts, because there is all the difference in the world between a partially roofed court and a partially unroofed apartment. It did not exist in Egypt, the most rainless and temperate climate in the world; and no example is known in Persia or India, or any other country I am acquainted with. Yet, strange to say, Professor Rawlinson quotes me (p.380) as an authority for its existence in India! Had he read the paragraph he refers to, or looked at the plan therein mentioned, he could not possibly have made such a mistake. I have, afterwards, again and again reverted to the subject; as, for instance, in the "Handbook of Architecture," wood cuts 47 to 50. I must, therefore, now be allowed to state, as clearly as I can, that, though the Indian builders may not be the best in the world, they do know something of their art. They put roofs on their buildings to keep off the sun, and to keep out the rain; and they do not immediately afterwards take off a large enough portion of them to let in both. In fact, the hypæthron, as it is usually understood, was impossible so long as common sense was the prevailing element of architectural design. It was the creation of men who built Grecian temples in northern climates, and is believed in by men who build Gothic edifices in the nineteenth century.

THE EFFECT OF SHAPE AND POSITION UPON THE STRENGTH OF IRONWORK.

"IT is stronger that way," is the reason every village carpenter would give why he placed his purlins and rafters with the greater side vertical, and for a long time engineers and architects in dealing with constructions of iron were content to rest their faith upon no better foundation. So long as they confined themselves to simply imitating, with some unimportant modifications, those examples which precedent and experience had demonstrated to be thoroughly reliable, no evil resulted. But, with the introduction of railways, and the unprecedented exigencies of locomotive traffic, a departure from the old patterns, so to term them, became imperative, and it was then apparent how very little was known respecting the influence of the form and position of beams and bars upon their absolute ultimate strength. Owing to the failure of numerous railway bridges, in the infancy of steam locomotion, it was rendered necessary that a series of investigations and experiments, conducted with all the accuracy and skill at the command of the profession, should be undertaken, and the results made available for future guidance, reference, and authority. Although the correct position in which to place a rectangular beam is universally known, yet we are far from having ascertained a similar amount of knowledge regarding those of a different shape. The manner in which the strength of an ordinary T iron is affected by its position, affords an excellent illustration of our meaning. Mr. Hodgkinson carried out some experiments upon this subject, and, with the view of deducing some definite conclusions with regard to the ratio of the breaking strain of beams precisely identical in shape and scantlings, but fixed in two different positions, he selected two cast-iron beams of the shape shown in fig. 1. They were seven feet in total length, cast from the same pattern, placed upon supports giving a clear span of six and a half feet, and broken by the gradual addition of weights suspended from their centres. It may be remarked here that, whenever possible, in testing girders and beams, either for deflection, or for ascertaining their actual breaking strength, it is preferable to perform the operation by the agency of direct weights alone, and not by the intervention of levers. There are many reasons why levers are usually resorted to. In the first place, they are more convenient, and the testing operation is conducted with greater ease and dispatch, the progressive piling up of the necessary weights being dispensed with. Evidently when the testing is to be upon a large scale, levers must be employed, as it would otherwise involve an extraordinary amount of labour, and incur an unwarrantable waste of valuable time. The objection to the use of levers is that, even when they are constructed upon the most delicate and approved principles, they exert more or less degree of violence upon the specimen under test, which consequently does not yield to the action of a simple weight, but is, if it may be so expressed, coerced or forced to break. One thing is very certain, that, if one of two similar bars were broken by a lever, and the other by dead weights superimposed regularly and gradually, the latter would be found to require a greater total weight than the former to determine its fracture.

In fig. 1 the two cast-iron bars we have referred to are represented in section, and in fig. 2 they are shown each in half elevation, and resting upon the supports. The fig. 2 is divided by the line A B, one-half of the beam being represented with the table, or horizontal portion, upwards, and the other half with it downwards. The bar that was broken with the table portion upwards, as represented by C in the figures, yielded to a weight of 0·162 tons, while that with the table downwards, D, required 0·50 tons to effect its fracture, evincing practically three times the strength of its neighbour. Notwithstanding the palpable character of an experiment of this description, and the advantage to be gained in an economical point of view in profiting by it, yet it is a common occurrence to witness it completely disregarded, and the beams placed in that position affording the least amount of strength. Not only was the difference in the actual breaking weights strongly displayed, but the deflections varied also in a corresponding proportion. The ultimate deflection of the bar D was exactly 4½ times that of C, and the permanent deflection, or set, as it is technically called, was nearly in the ratio of 8 to 1. Having acquainted ourselves with the fact that the bar in the one position is three times stronger than in the other, let us now endeavour to account for the circumstance. The bars being of cast iron, the first point to bear in mind is that that material possesses a compressive strength which is to its tensile strength as 6 to 1, and consequently it will be weaker or stronger accordingly as its fracture is determined in relation to one or other of these resistances. Referring to fig. 1, it will be at once perceived that the bars may be regarded as consisting of two separate portions, the table or horizontal part, and the vertical part or rib. This latter constitutes the real resisting part of the bar, since it is virtually the depth, and therefore the position of it and the strain it is exposed to will affect the strength of the beam. When in the position represented by the bar C, that is downwards, the action of the weight tends to extend it, that is to accomplish its fracture by overcoming its tensile strength, which we have stated to be comparatively small, with respect to that it exerts against compression. But when the bar is broken in the position D, the conditions attending its fracture are reversed—the rib is upwards, and fails by the yielding of its compressive and not of its tensile strength, and consequently supports a much greater weight previous to fracture. Beams of the section shown in fig. 1 are much inferior in strength to that in fig. 3, in which the ratio between the areas of the top and bottom flanges is as 6 to 1. But they are, nevertheless, not to be altogether discarded. They possess the merit, a very important one in a practical sense, of being readily cast, and are not, by any means, a weak or unscientific form of beam, although inferior to the particular example quoted, which represents the section of maximum strength with a given area of metal, for all beams of cast iron. For very light weights and small spans the T-shape would be available, where there would be an absolute waste of material in employing the doubled-flanged section in fig. 3. Care must be taken to be very cautious in using cast-iron beams with openings in them, as shown in fig. 4, a description of design favourable for ornamental purposes, but certainly not for any other. A distinction here is at once apparent between the conditions attending similar examples of construction in wrought iron. Experience has long since confirmed the opinion that open-work wrought-iron girders, including all the varieties of the lattice, warren, and trellis forms, may be used with the same safety as their older and more cumbrous predecessors. It might have been that the objections raised by the advocates of the solid sided girders, against the employment of the more elegant and lighter system, were founded upon the argument that because it had been proved to be not suitable in the case of cast iron, it was, therefore, not likely to succeed with wrought. However well arguing analogically may answer in some matters, it does not always hold good in questions of a scientific nature.





That many of the older authorities upon engineering and architectural subjects were lamentably, although not culpably, ignorant of the proper forms of iron beams, may be judged from the fact that Tredgold considered the beam represented in fig. 5 to give the section of maximum strength, wherein the top and bottom flanges are equal in area. Subsequent experiments, however, have demonstrated that, far from approaching in its powers of resistance the section of maximum strength (see fig. 3), it is considerably weaker than the T form in figs. 1 and 2. It is, for cast iron, therefore, an objectionable form which should never be employed. In addition to the theoretical considerations governing the design of a cast-iron beam, those of a practical nature must be attended to with equal if not greater regard. The strength of any beam is directly proportional to its sectional area, that is, the number of square inches contained in a section

perpendicular to its longitudinal axis. With cast-iron beams there is no question but that the strength, while obeying the above law, is also in a great measure dependent upon the superficial area, not in a theoretical but in a practical point of view. A little reflection will indicate that, as the process of cooling in the melted mass commences at the surface, those layers lying immediately subjacent to it, are cooled with a considerably greater degree of rapidity than those placed more remote, and towards the centre of the beam. Besides, if we imagine a certain thickness of the metal near the surface to be solidified, while the internal portions of the beam are yet in a state of incandescence, when they are in the act of cooling, they are prevented from contracting according to the laws governing metals, and remain, therefore, solidified in a condition of permanent initial tension, which, from the contents of the present article, must be very injurious to the future strength of the beam. Since the outer and inner portions of a large casting, or of a thick beam, do not cool uniformly, it might be expected that there would be a difference in their relative powers of resistance.

This has been proved to be the case, by testing pieces of the metal taken from different portions of the same casting, and the result has evinced much discrepancy between their relative breaking strength. All angles, marked disproportions of area, unequal thickness of metal, and abrupt bends, should be avoided as much as possible in designing cast-iron beams, whatever may be the peculiar shape selected. There is but little use in calculating the proportions of the various parts, and adhering blindly to the rules of theory, if due attention be not given to the requirements of the foundry. We shall resume this important subject at a future period in connection with wrought-iron beams, which have, in a great measure, superseded, for spans possessing any magnitude, and for railway bridges, their cast-iron predecessors.

DESIGN.*

BEFORE proceeding further, let me remark that the details, whether derived from past ornament or direct from Nature, are the materials of the designer, and are separate from the rules for their arrangement and adaptation, which have been called the principles of design. I may remark also that formerly the architect not only designed the structure itself and the ornament that enriched it, but the furniture, the hangings, the glass, the metal work, and the utensils, at least of the sacred edifices. Hence the architecture of a period ruled the ornament of a period, and hence the necessity for studying the architecture of the past if we would have a large view of the principles of its ornament. Indeed I would impress upon you an earnest study of the past, not to repeat merely, as did the artist of the Renaissance, but to learn the laws which guided them of old, and then to go to Nature for new details to subdue to the wants of ornament, as was indeed the practice of the men whose works I would urge you to study—these abound with a knowledge of the past. You may go to Nature without fear of the meanness of mere imitation. In Nature's domains we find every form which has served to make Art beautiful. Surrounded by the glowing tints of spring, or the mellow hues of autumn, by the perfect forms of opening flowers, and the stately splendour of the full grown forest trees, the man is dull indeed who would not endeavour to enrich the objects which arise under his hand—the house wherein he shelters himself, the articles which serve him for his domestic wants, and the implements wherewith he obtains his food and carries on his daily avocations—with transcripts from or imitations of her wondrous ornaments. The student who has been taught to look at Art merely through the light of bygone ages, or to judge of beauty by the measure of the taste of his countrymen, has much, very much, to unlearn ere he can hope to attain any great extent of originality. He may modify and recombine the forms of Classic Art, or he may, perhaps, generalize them, and thereby lose not only the spirit of their first adoption but their truth. He may strike out for himself a new path, founded on the Art of some ancient people, but he will rarely succeed in producing designs in the spirit of the times in which he lives, or likely to suit the taste of the public. He has commenced at the wrong end of Art; he can look at Nature, when he comes to acknowledge her as the one source from which his ornament should be derived, only by the false light of the ideas he has acquired. His foliage, his flowers, his forms are not the foliage, the flowers, the forms of Nature, but of the school in which he has learnt, and here is the great danger of the too exclusive study of the ornamental forms of any particular country or style, without reference to the peculiar circumstances or conditions which led to their adoption, or occasioned their use. Ancient Art must be to the designer a model—an oriflamme—of what great and good designers of past ages gleaned from or admired in the storehouse of Nature; he must see in it an example of how to draw from her boundless treasury similar and parallel ideas, and to combine and modify them to suit his own times, and the means of production or the formative processes of his own country.

I may, therefore, consider ornamental design under three heads:—The law of arrangement, which governs the details or component parts; the subservieney of ornament to utility; and, thirdly, the source of design, and the treatment of its elements to suit the material on which the design is to be wrought.

Ancient ornament was mostly subordinated to a geometrical arrangement. In Egypt, in Greece, and in ancient Italy, this was usually the case, even in those works which had little mechanical aid, such as the carved ornaments of their temples or the painted decoration of their furniture, while, in works produced in the loom, geometrical recurrence became more or less a necessity. In some of the Egyptian temples there is observable an apparent symmetry, as in the capitals of columns, which have a likeness in general form, combined with a large variety in the details of the parts. In many of the minor ornamental treatments, the details or elements of the ornament are arranged in an alternate symmetry, as we found was the case also in the ornament of the Jewish Tabernacle, and in the priest's garments. This also was the case with Greek sculptured ornament, while we find it varied on the borders of their garments—on the ornaments of their utensils and vases, with a recurrence of two and one—a recurrence on opposite sides of a central line—one and three, &c. Rarely in Classic Art is the law of apparent symmetry adopted, while it is found to give great freshness and variety to Gothic ornament. We may, therefore, deduce that symmetrical arrangement, apparent symmetry, and recurrence or alternation of parts, are laws observed in the best periods of Art.

From ancient Classic Art, as well as from the best Art of the Oriental nations, another ornamental law is observed, which is, that the general form of the moulding, or any part of the surface decorated, is not disturbed by its ornamentation. The ornament being incised, as was much of Egyptian ornament, or parts of the general surface lowered, leaving the ornament in relief, or otherwise, the relief was very low. This ought also to be the case in the decoration of all instruments or utensils, as indeed it mostly is in the best periods. Thus, we rarely find any relief ornament in the beautiful Etruscan vases, the pure form chosen being preserved, the ornament being merely painted on bands and borders, in simple bands of black, white, or red; while in the best goldsmith's work of the Middle Ages we find the same law attended to. From ancient Art we also learn that simplicity and restraint are principles acted on, and which ought to be kept in view by every designer.

How large is the unornamented surface in the Doric temples, supporting, and enhancing the few simple elements used in the parts decorated, as was the case also in their vases and utensils; and what repose and perfect taste is the result! How contrary to the application of ornament in the early part of the present century, when our pottery was hidden under a heap of decoration, and our goldsmiths covered their vessels with coarse and ill-executed relief, pleasing, it is true, the purchasers of their wares, who considered not the Art embodied, but the weight of silver and the glitter of surface! And I must allow that there are many causes in the present day leading to this extravagance and excess in ornament rather than to restraint, the greatest cause being readiness of mechanical reproduction. In the time of the handicraftsman decoration was sparely applied, and the workman strove after perfection. Now, the machine so easily attains a mechanical perfection of parts that the manufacturer is induced to overload his work with ornament, and thus to vitiate the taste of the purchaser. This leads me to consider what is and must always be a most important drawback to freedom and variety in design—namely, those mechanical means by which the design is to be manufactured, or by which the pattern is to be many times repeated in or on the raw material.

The mediæval workman or artizan had few, if any, of the modern appliances for the rapid production of his hangings, his metal work, or his woven fabrics—his handicraft was unfettered by the cylinder, the electro-block, and the mould. The beautifully wrought forms of hammered ironwork, and the flowing and varied lines of brocaded silks, the rich diapers that covered the walls, and the quaint tiles that decorated the floors, were innocent of steam machinery. How altered is all this now! The moment that the manufacturer becomes possessed of a design, his only idea is how it may be produced and repeated in endless numbers by the mould, the block, or the cylinder. With these he may be able to present a most precise resemblance of the Art which was most admirable in that design; he may be able to represent the outlines and the colours with far greater exact precision than the worker of the Middle Ages could ever achieve; but how dull, how monotonous, is the result of his labours when compared with the skill of the handicraftsman, which is like the ever-changing repetitions of Nature, where on a tree with a million leaves no two would ever be exactly alike, or the ornaments of a Gothic building, where the tracery of every window, the foliage of every corbel, and the carving of every stall, is different. And this leads me naturally to another direction of the modern designer's studies—the knowledge of the processes of manufacture involved in the production of the objects for which he will be called upon to prepare designs. He must learn the width of the paper, the cotton, or the silk, and infer from them the sizes of his blocks or groups. He must acquaint himself with the girths of the cylinders, and calculate the frequency of his repeats. He must be able to judge of the numbers of cards required to reproduce his drawings in the Jacquard loom, and he must know the processes which the metal, the clay, or the glass undergo in their various stages, from the raw material to the finished object. More than this, also, he must be able, to a very great extent, to judge of the variation which the outline of his design will be subjected to from the nature of the impossibility of representing curved or flowing lines in woven carpets, or delicate and well-kept outlines on block-printed paperhangings.

I must now very briefly consider another law of design—its relation to utility. Having decided on a form which combines the greatest convenience for use with the utmost elegance, the designer has to enrich it with suitable embellishment. The talent and skill which he brings to bear upon this, and the style of ornament chosen, are secondary matters as compared with the position and quantity of the decoration, the fitness of the ornamentation to the object and to its uses as a whole. To give an illustration—when we desire to produce an article for some purpose which necessitates our taking a firm hold of it, it is usual to roughen the surface to be grasped. This may be done ornamentally, but it should not be so treated as to mar the originally conceived graceful form, or, by the lumpiness of its relief, to inconvenience the holder, so that, instead of facilitating his power of grasping it, he is prevented from holding it with ease and security. Yet, how often is beautifully wrought work thus misplaced!

Another important quality has already been alluded to, viz., reserveduess. Nothing is so vulgar as redundancy. Ornament should be so distributed that it only occupies a part, and that a small part, of the surface, either in bands or groups agreeably disposed so that the natural surface may serve as a contrast and foil to the enrichment, and supply the quality known in Fine Arts as breadth. We will assume that the article to which the decoration has to be applied is a silver goblet. If the enrichment, whether it be in the form of chasing or *repoussée* work, is too lavishly applied—if the foot, the stem, and the bowl of the

* Read by GILBERT R. REDGRAVE, before the Associated Arts' Institute, January 14th, 1868, and continued from page 61.

cup are alike loaded with orn ament, even if th ornament be the best of its kind—few will deny that there is too much of it; the eye wants some quiet plain surface to contrast with the richness of the remainder. This is obtained by reserve; and the knowledge of what amount of surface should remain untouched by his art is an important consideration to the designer.

I have already spoken strongly of the necessity of recurring to Nature and natural forms, for new details of ornament. The laws of arrangement are few, simple, and easily mastered; even the structural lines that govern the disposition are very limited. The right line, the oblique line, the curve (simple or complex), the scroll of varied curvatures, represent the sum of these leading lines. The details which they govern, and with which they may be clothed, are as infinite as are the natural objects from which they are derived. But how is the artist to use these details? Imitatively, or, as it has been called, conventionally—a term often misused, but which really means subordinated to the materials in which they are to be wrought, and the manner of working them. Here my subject leads me to what might well furnish matter, not for a section of a lecture, but for many lectures, and I have time only for a few concluding sentences.

I am sure that I have said enough to convince you that I am an advocate for Nature as the only true source of novelty in design, but I must not be misunderstood as implying that Nature is to be merely imitated. As in Fine Art, so in ornament; the lowest merit is that of mere imitation—nay, as it often degrades Fine Art, so it is often a fault in ornamental Art. What should we say of a sculptor who should cast the human figure, and think the exact imitation he achieved Fine Art? Or what should we think of a goldsmith who should electrotype natural leaves and flowers, and place the meretricious tinsel on his cups and chalices as good ornament.

Details derived from Nature must be subordinate to Art—must be treated in a large manner, suppressing those minutiæ which are unnecessary to expression—must be rendered suitable to the material and mode of execution in which the design is to be wrought. And it will in most cases be found that the more literal the imitation, the meaner will be the style, the weaker the expression of the work. I would conclude, therefore, with the eloquent words of one who had some experience as a designer, and who made many efforts for its improvement in this country—the late Mr. Dyce. He says, "I conceive that the Art of the past is, like its literature, a storehouse of which the treasures must be known by us before we are in a condition to become explorers in our turn. Heartily concurring in the opinion so ably urged by my colleague (the lecturer on botany as a source of ornament) that original design can only be produced by the same means from which it resulted in past ages, namely, by a reference to Nature, the source of all beauty in design, I would only require that such reference should be aided by the experience afforded us in the labours of our predecessors. The first step in any pursuit is to inquire what has already been done. When a man undertakes to treat of any subject, he first sets himself to read all that has been already written upon it. And so it must be in ornamental Art. We do not now take it up for the first time—its principles have been more or less truly developed from the earliest ages; sometimes they have been developed in one direction, sometimes in another; sometimes the development has been a right one, sometimes erroneous; but through all there has predominated that very attempt which we in our turn must make, namely, to apply the treasures of natural beauty to the purposes of decoration. Hence the peculiar value of the study of ancient ornamental Art. I am no advocate for a blind obedience to precedent, but let us not fall into an opposite extreme. Let us beware, lest by undervaluing and neglecting the study of ancient Art, we commit as great a mistake as those who study only to reproduce it. Let us beware, lest, while we think we are producing novelties, we are only, in fact, doing that badly which has already been done much better."

ST. MARY'S, ITCHENSTOKE.

OUR two illustrations are engraved from photographs showing the exterior of the east end of the above church, and its interior, looking west. The building is of brick, laid in cement, faced with Godalming stone, with Bath stone dressings. The ground plan shows the disposition of its parts.

The lower portion of the western façade is occupied by a porch or narthex extending the full width of the building, and vaulted and roofed with Bath stone. It is divided externally and internally into three compartments. Of these, the centre one, containing the western door, projects slightly beyond the others, and presents a gabled façade to the west. The two side compartments have lean-to roofs, formed of slabs of Bath stone, weathered to correspond with the adjoining buttresses. The western doorway is large and lofty, of three orders, the mouldings very bold, the capitals foliaged, supported by shafts of red Mansfield stone. In the pediment above the doorway is a niche with shafts of polished red granite, containing a statue of Our Lord as the Good Shepherd. The apex of the gable is surmounted by a floriated cross in Mansfield stone.

Above the porch is a large rose window, with a pointed hood-moulding. In the pediment above is a double quatrefoil enclosing in its cusps a massive boss of ruby glass—the gable is surmounted by an eight-pointed interlacing cross. The doors are in two valves, sliding backwards and forwards on rollers in a recess provided in the masonry. They are of oak, ornamented with iron scroll work, and within them and working in the same recess is an elaborate wrought-iron grille, by Brawn, of Birmingham. In summer the oaken doors will occasionally be drawn back, and the grille drawn forward in their place. One of the valves of the oaken door contains a swing wicket, which is found useful in south-westerly gales.

Passing through these doors the porch is entered. Its interior is divided into three compartments by two transverse arches of two orders, deeply moulded, and resting on foliaged capitals surmounting sixteen polished shafts, which are alternately red serpentine and green marble. The vaulting of the central compartment is quadripartite, and the two side compartments are tunnel vaulted. The vaulting is of Bath stone, with deeply moulded ribs, and carved bosses and caps. Stone seats, containing sitting room for sixteen persons, are fixed round the three sides of each of the lateral compartments, and between these seats and the vaulting the walls are enriched by a diaper of the same pattern as that in the spandrils over the nave arches at Westminster Abbey. This narthex is lighted by cross-shaped windows situated at its northern and southern extremities, these openings being filled by a ruby cross, surmounted by a crown, with the legend underneath,—

CHRISTI CRUX EST MEI LUX.

This narthex or vestibule communicates with the nave by swing doors provided with large panels of plate glass, covered with chocolate baize: they open both ways, or are folded back in the thickness of the western wall. By this arrangement, a sheltered vestibule or porch is provided, effectually securing the interior from draughts, and at the same time the entrance is made at the western extremity of the building, by far its most effective position, as regards the "coup d'œil" in entering the church. Passing these swing doors we enter the nave, which is fully illustrated in the accompanying interior view (taken from the altar, looking west). Its most noticeable feature is the design and coloured ornamentation of the roof. The design of the roof is shown in the engraving. The key-note of its colouring is the natural tint of its material (yellow pine) varnished, but unstained. The principals are darker, from having been exposed to the weather for some weeks before the church was covered in. The panels of the roof are "sown" with purple cinquefoils, with a white eye and margin. The ridge piece, wall plates, intermediate principals, and purlins are all deeply moulded with projecting rolls, separated by deep hollows, all mitreing into each other: the colouring of these, as also that of the arched ribs of the roof principals, and the cornices, is from the Church of Sainte-Nazaire, the old Cathedral of Carcassonne, the best thirteenth century example extant of such ornamentation. The section of the roofing ribs (which are 8in. thick) consists of three filleted rolls, separated by two deep hollows filled with "pellets:" these pellets and fillets are gilt. The colouring and gilding thus sparingly introduced assorts so well with the natural tint of the material of the roof, that the result is eminently effective and harmonious.

The capitals of the shafts throughout the building are all different, and carved from natural foliage, the forms having been duly conventionalized for translation into stone. The spandrils of the wall above the windows are diapered, as in the porch; the wall spaces beneath the windows and above the bench ends are also enriched by three panels of similar diapering in each bay, each panel being enclosed in a narrow tile border designed for the purpose. The easternmost bay of the nave serves as a chorus cantorum, containing the organ and the singers.

On entering the western door, the eye ranges past the nave to the chancel arch and apse beyond it. The chancel arch fills up the entire width of the nave; its springing is of the same height as that of the nave roofing ribs, with which it is also concentric, thus avoiding the dead wall space that usually stops the eye above the chancel arch, and thereby robs the chancel of the crowning grace of lofty proportion. There is, in fact, only one line of springing throughout the church, the capitals of the nave windows, of the nave roofing shafts, of the chancel arch, of the apse windows, and of the apse vaulting shafts, being all on the same level.

The apse consists of five sides of an octagon; it is vaulted in Bath stone. The ribs are of the same section as the arched ribs of the nave roof, except that they have greater depth. The tracery of the apse windows is shown in the exterior view. It is noticeable that the capitals of the window mullions of the apse are on the same level as those of the adjacent vaulting shafts. This arrangement distinguishes the apsidal chapels of the Cathedrals of Beauvais and Trèves, and is one very much more harmonious in effect than the usual method of placing the caps of the mullion shafts at a higher level.

The arrangement of the sacrarium is peculiar—it is circular on plan. A circle is inscribed within the octagon of which the apse forms five sides, and the portion of this circle projecting beyond the piers of the chancel arch renders the altar steps and altar rail arcs of the same circle. The space enclosed by the altar rail is, therefore, circular on plan; and the pavement is a modified reproduction, in glazed green and chocolate tiles, of one of the concentric labyrinths (called heavenly Jerusalems) that so frequently occur in the pavement of early French cathedrals. Beneath the apse windows is an arcade, with shafts of polished red granite and Californian marble, the latter a diaphonous material closely resembling the so-called Algerian agate, but infinitely richer in colour. This arcading forms three niches under each of the five apsidal windows. The three beneath the easternmost window form the reredos, and are filled in by glass mosaic executed by Powell. The twelve remaining niches are backed by slabs of polished marble, and form a row of sedilia, encircling the apse, as in the early basilicæ. The pellets and fillets of the vaulting ribs of the apse are gilt, and the foliage of the central boss is picked out with gilding, as are also the more prominent fillets in the mouldings of the chancel arch. This small amount of gilding harmonises well with the warm cream colour of the Bath stone. From the central boss of the apse vaulting is suspended a very good jewelled "corona lucis," by Hardman. The altar consists of a massive slab of oak, with a gilt pellet moulding round its under edge, supported at its angles by four stout shafts, with gilt bases and capitals of early French foliage. The space between the two shafts at the back of the altar is filled in with a panel covered with porcelain tiles of a richly coloured diapered pattern. The altar rail is of brass, and forms in plan a segment of a circle. The riser of the chancel step is of tiles, inscribed "Non nobis, Domine, non nobis, sed tuo Nomini da gloriam." The eagle, designed by the architect, is of brass, with a jewelled collar and crown.

The church contains thirty-two windows, all of which are of stained glass; that of the five apse windows is from Mans and Auxerre, and is peculiarly rich in effect.

The illustration shows the composition of the west wall of the interior. Its surface is diapered; the rosettes that fill up the spandrels between the rose window and the string beneath it are composed of a central boss of emerald glass, surrounded by eight pear-shaped bosses of emerald and ruby glass alternately, the whole fixed in a setting of moulded and gilt stonework. The shafts of the arcade below are of polished chocolate coloured serpentine, backed by polished slabs of Sicilian marble, some of which are already filled up with monumental inscriptions.

The general design of the font is shown in the illustration. From a circular step of polished black marble, 4ft. 6in. in diameter, rises a circular plinth of the same material, supporting eight shafts of Californian marble clustered round a central column of black marble, the foliaged

capitals and bases of the shafts being gilt. On these capitals rests the bowl of the font, formed of one block of polished black marble, with eight sides, each a perfect square. In the centre of each square is sunk a jewelled rosette of gilt bronze (of similar design to those below the rose window). Each side is bordered with a row of smaller jewels (emerald and ruby alternately), set in gilt cup-shaped settings. A vertical row of similar jewels, but larger, is similarly set in the central black marble shaft between each pair of the smaller shafts. The idea of thus combining gilt bronze and coloured enamels on a ground of polished black marble is taken from the tomb of Mary of Burgundy, in the Church of Notre Dame, at Bruges.

The bench ends are rectangular, containing sunk panels filled up by scroll work of gilt metal. The panels of the pulpit (which is approached directly from the vestry) are similarly treated.

The exterior of the east end, and also the bell-turret, is shown in the exterior view. The eight shafts of this turret are of polished red serpentine, and harmonise well with the architrave of glazed tiles, chocolate and green alternately, which is placed over the niche containing the bells. The bells are swung by levers. The finials of the cross surmounting the bell-turret are gilt buttercup leaves; the cock is from Saint-Chapelle. The ridge-cresting of the nave roof is of buttercup leaves; that of the chancel is of buttercup leaves at the top, the two lower tiers of leaves being copied from very beautiful exotic types. The cresting of the chancel roof, the metal finials, and the lead rolls from which the centre finial springs, are painted chocolate, picked out with gilding.

The cost of the church was almost entirely defrayed by the incumbent, the Rev. Charles Conybeare, the only exceptions being that the rose window was presented as a memorial to the late Lord Ashburton, by Lady Ashburton, and a portion of the cost of the chancel was subscribed as a memorial to the incumbent's father-in-law, the late well-known ecclesiologist, Mr. Markland; the narthex was presented by Mrs. Markland, and some of the internal fittings, as memorials, by other friends. Mr. Henry Conybeare was the architect.

THE SEWAGE QUESTION.

THE notices served by the Conservators of the Thames on the various local boards of towns which at present discharge their sewage into that river, have been the cause of considerable perplexity. The question of the drainage of these towns is placed on altogether a different basis from that which it assumed before these notices were issued; and accordingly we find the engineers to the different boards busy in the explanation of their theories, and the preparation of their schemes, for the drainage and utilization of the sewage. So much is said about projects of combination of towns for this purpose, that there seems some danger of a gigantic blunder being committed. It was actually suggested, at a recent meeting in Manchester, held to consider the drainage of towns in the surrounding district, that the only way to dispose of the sewage was to send it into the sea, or to combine a number of towns, and execute some grand project. A proposition was also made within the present year to carry the sewage of Kingston, Surbiton, and other towns in the Thames valley, now drained into the river, away to the sea, through Kent, by means of an immense main sewer. Of course to any proposal for utilization, the old objection of the difficulty of obtaining sufficient land upon which to use it is raised. Towns, for the purpose of utilizing the sewage, ought to be individualized—not combined. Even the sewage of a single large town should not be concentrated to one point, if it can be accumulated at two or more, and thence distributed in different directions. Of course, at first it is much cheaper to lay down one main than to lay two; but, considering the probable extension of towns in directions yet unforeseen, it certainly appears true economy to place the irrigated land further into the country, and thus make way for the extension of buildings. It is argued that the nuisance arising from irrigated land would be intolerable near a town; but why should the sewage be exposed to the atmosphere? By conveying it beneath the soil we avoid this, and we at once send it to the roots of the plants, and retain in the soil for their benefit its volatile parts, which, when exposed above the surface, are offensive and become lost. By this means also we can benefit root crops and cereals. Mr. Wilkins's experiment at Reading in 1855 amply proved the benefit derived by plants fed with sewage conveyed beneath the surface. The mean rate of fall of the river from Oxford to London being little more than two feet per mile prevents any general system of irrigation by gravitation, and the necessity arises of pumping the sewage to elevated land. Great facility is offered for this purpose by the power of the water falling down the river, which should obviously be used for preventing the fouling of the stream by the sewage of towns on its banks. In October last the members of the local boards of Windsor and Eton addressed a letter to the members of the various boards throughout the kingdom stating the above fact, and that, after mature consideration, there appeared to them to be the three following systems of drainage worthy of special consideration.

1st, That in which the whole of the sewage and rainfall of a district is conveyed by one set of sewers to a given point.

2nd, That in which the sewage and a portion of the rainfall is conveyed by sewers to one outfall, whilst the remainder of the rainfall is carried away in a composite manner to the nearest watercourse.

3rd, That in which the sewage and rainfall are kept perfectly distinct, and each conveyed away by itself—the sewage to a given outlet, and the rainfall to the nearest watercourse.

The letter then proceeds to the consideration of these three schemes, the first of which it practically condemns. It also urges many objections against the second, which is that practised and advocated by Mr. Rawlinson; and reports favourably on the third, which, as it states, Mr. Menzies, the Deputy Surveyor of Windsor Forest and Park, was the first to bring to a practical conclusion. The principle he lays down, is, at least, a simple one—exclude all the rainfall and all the subsoil water from the foul drains, and conduct the sewage, with its attendant regulated quantity of flushing water, to the outlet, and then apply it to the land. A pamphlet has just been issued by Mr. Charles Slagg, Assoc. Inst. C.E., Borough Surveyor of Kingston-on-Thames, on "The principles of Town Drainage," and apparently specially prepared in reply to this letter of the Windsor and Eton Local Boards. Now, as Mr. Slagg remarks, the last-mentioned system may be the best in a town which has no existing sewers or drains, but when we come to the consideration of the case of a town already drained, or partially drained, the question assumes quite another aspect. The reservation of the present sewers for sewage only, and the construction of new drains for the rainwater, would be a work not only of extreme costliness, but considerable difficulty. This important consideration, he thinks, must prevent the adoption of scheme No. 3. With regard to scheme No. 1, he considers that the general proposition that sewers should carry off all the rainwater as well as the sewage to the outfall, is perfectly untenable. Sewers made large enough to do this would be so costly as to prevent the possibility of their construction; and, beside this, the difficulty of dealing with the whole body of rainwater at the outfall increases the impracticability of the scheme. The 2nd system—viz., that in which the sewage and a portion of the rainfall is conveyed by sewers to one outfall, and the remainder of the rainfall to the nearest watercourse, he recommends as the most advisable for general adoption. He advocates that one-third of the surface water (that falling in the streets) should be kept out of the sewers altogether; that another third, that from the roofs of buildings, should be stored, used, and sent into the sewers gradually; and that the remaining third, that from the back premises of houses, should be allowed to flow into the drains as it falls, for the purpose of flushing the drains, and for the sake of economy of construction. Without expressing any decided opinion, we certainly think Mr. Slagg's argument worthy of attention. It is now pretty generally admitted that public rivers never can be absolutely pure. It has been proposed by some who advocate the artificial filtration of the sewage that a comparative standard of purity should be enacted by law. But it is by no means certain that any process of filtration can be perennially effective. The recent experiments made by Mr. Byrne in this direction, and which we noticed at the time, serve to show that all filtering mediums become inoperative after a short time, and that the liquid will then be rendered more impure than when it entered the filter. Would not an enactment be preferable, founded on the broad distinction of rainwater and sewage? the former to flow into the rivers by the natural channels, and the sewage to be used for purposes of irrigation. Let the authorities then take as much land of various kinds as is necessary to the reasonable use of sewage of towns, and make the best use of the sewage upon it that may be practicable, and there let the question, at least for a time, rest.

THE NEW AMERICAN RAILWAY CONSTRUCTOR.

A NEW machine, which, if it performs half what is promised, is certainly one of the most remarkable ever produced, has been brought out in the United States. It is the invention of Mr. D. W. Robertson, of Star city, Humboldt, Nevada, and is described as an apparatus which, by a combination of movements, levels the loose surface of the soil, places the ties at uniform distances, follows any curve, accommodates itself to ordinary gradients, deposits the rails with the chairs attached, and fastens them securely in their places. It is stated that as much work can be done with it by 20 men as by 200 without it. A San Francisco paper says, the machine is comprised within a frame, 60ft. long, 8ft. high, and 12ft. wide, and has somewhat the appearance of the skeleton of a wooden bridge placed on a low railway truck. This truck only supports one third of the length, the forward part, which is two thirds of the whole, overhanging the ground over which the track is to be laid. The heavy stringers which taper gradually to the front, give strength to the machine and preserve its balance. It is fitted with a 10-horse engine, and, as it travels forward, moves on rails of its own laying. A plough in front of the machine levels the ground for the permanent way, the ties brought from the back over the workmen's heads, by two endless chains, are laid on the ground exactly in their required positions. Clamps connected with a hoisting apparatus, raised sufficiently high, pick up singly the rails, which are stacked at the rear of the platform, on each side of the motive power, while in suspension. They are run forward by means of overhead tracks and cars, till they hang over the spot they are meant to occupy. The chains are slipped over the rail ends, as they travel, and the rails are then lowered by machinery to their places. The chairs have then to be nailed firmly to the woodwork, the spikes driven home, and the constructor travels on over the road it has just made. Fresh ties can be constantly supplied by the track behind, without stopping the work. The front of the machine can be elevated or depressed to the fractional part of an inch, to accommodate the rise or fall of a gradient. It can, if necessary, turn itself on a radius of 200 feet. A position for the managing engineer is built among the heavy framing above, from whence, comfortably sheltered, he can control and survey the whole.

FROM AUSTRALIA.

MR. JOHN B. MURRAY, Corresponding Secretary of the Stonemasons' Friendly Society, in Sydney, in a letter to Mr. Richard Harnott in this country, says:—With regard to the state of trade in this colony at the present time, I am very glad in being able to inform you that it is in a very healthy state; in fact, I have never known it to be in a better condition for some time than it is at present, for every mason seems to be employed, which is a very good sign. Since I wrote you last, tenders have been called in for the erection of the new General Post-office, which is to be a very good job, and will employ a good number of masons for some time. Also, a premium has been offered for the best design for a new Townhall, to be built in Sydney, and, as the time has expired for the competitors to have in their designs, we expect that tenders will be called for the erection of it forthwith; so, taking everything into consideration, such as trade is with us at the present time, and our prospects for the future, we cannot find room for any complaint as regards the work in the city. The railways, I am glad to inform you, are going on well; a large number of masons are employed upon them at the various places, and everything seems to be going on in good order.

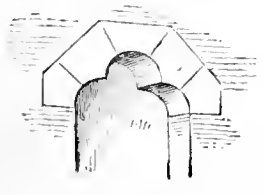
CONSTRUCTIVE AND ÆSTHETIC DESIGN.—No. XI.

IF one feature has distinguished our modern English architecture more than any other, it is the arch in its decorative functions. In the extended use and multiform applications of this feature belong the common ground on which the architects of the Italian and Gothic revival meet. Both schools here alike agree in the main—both reject the counterfeits for the realities, and both are seeking to develope the capabilities of the constructive arch, and make it decoratively an important element in design. We hardly know which set of artists have been most successful in bringing into play the twofold office of the arch, for we find in both cases the same desire to modify and vary its form, making it more or less the keynote of the whole composition, whether that composition assume an English, Italian, or French style of expression, whether it wear a Classic, Gothic, or Moresque character.

In our modern buildings the Gothic principle is still at work, though disguised under numerous forms of treatment. Thus, in our modern Palladian or Italian style, we find various combinations of the arch and lintel, and many modifications of the column, from the simple to the clustered shaft.

In some of the designs recently submitted for the New Law Courts, and illustrated in the BUILDING NEWS, ample evidence is afforded of the combination and mixture of characteristics of both styles; high-pitched roofs and other semi-pointed features being blended—in some cases incoherently—with the horizontal members, cornices, and columnar arrangements of the Classic Renaissance. The form, variety, and disposition of the arched openings, however, will be found in all instances to give an essential character to a composition in whatever style it may be conceived; and we may here devote our consideration to some very suggestive forms of the arch for the minor purposes of window and door heads.

One form of arch, singularly useful and highly effective for small openings, is the



square and round-headed trefoiled form. The flat-headed kind adapts itself most admirably for windows and doorways in positions that do not admit of height over them, and can be used consistently either in the horizontal or pointed styles, or in that common-sense style which is being gradually evolved out of the elements of both, and is assuming a place to itself in the architecture of the future. The

Fig. 1.

round-headed trefoil combines most agreeably with both round and pointed arch forms, and many happy examples of its use may be seen. Where external apparent height is required, but where floors or ceilings debar the architect from obtaining sufficient for this need internally, the trefoiled head suggests itself as an easy and effective means of finishing window and door apertures (see fig. 2).

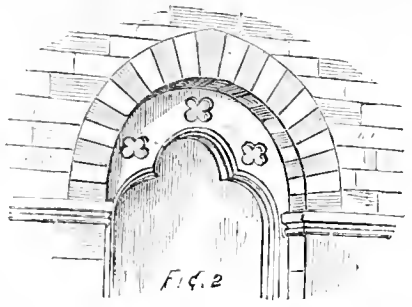


Fig. 2.

Windows arranged in couplets and triplets are often productive of the most pleasing combinations; and when a continuous series of windows, as in a long façade, is varied by single and double lights, or by couplets and triplets of them, a more charming variation is effected than can possibly be obtained by mere ornamental adjuncts or bands of coloured materials used in conjunction with a repetition of similar apertures. The plan of recessing such lights as shown in fig. 3, or enclosing

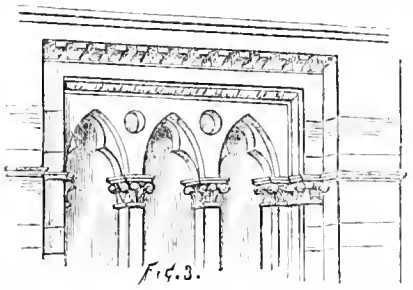

Fig. 3.

them under an outer relieving arch, gives a richness sometimes desirable in relieving the wall surfaces, without destroying the breadth or continuity of the composition; and, by connecting the lights in groups, the windows are not rendered unmanageably large. This is a great consideration in private dwellings; and in many public buildings and offices where plenty of light is required, and height of room is limited, thereby necessitating a regular distribution of small apertures. Such a grouping of lights is admissible in both Classic and Gothic structures, though in the latter only has it been extensively followed. The fenestral arrangements of some of our recent buildings evince a masterly conception and treatment of the above principle of design, and constitute a marked advance in our modern architecture. The end or Lothbury front of the Central Credit and Discount Company's offices, lithographed in the BUILDING NEWS (p. 11 and *ante*), presents a fair example of the grouping of small window openings in a building of semi-Gothic or Venetian character.

Figs. 4, 5, 6, show three distinct treatments

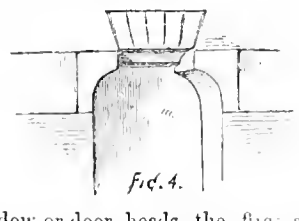

Fig. 4.

of window or door heads, the first and last combining the arch form with the lintel.

Fig. 5.

Width of opening can be frequently obtained without encroaching on the side

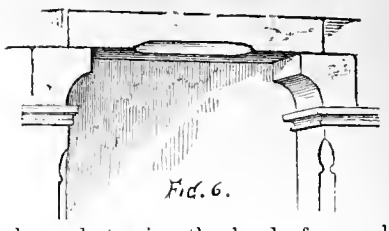

Fig. 6.

jambs, or destroying the head of an arch or its mouldings, by corbelling the most promi-

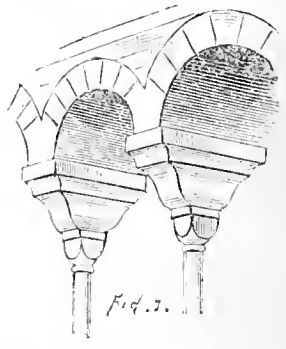

Fig. 7.

nent members of them at a proper height (fig. 8).

A correspondent has suggested the consideration that flat arches or square-headed

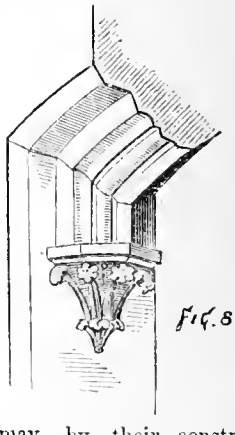

Fig. 8.

openings may, by their construction, be equally as good and strong as pointed arches, a point to be impressed, as he observes, in Gothic and Classic alike. The practicability

of making the arch stones of sufficient depth, so as to form a segmental, semicircular, or pointed line of extrados, is all that is required; and there can be no reason why the square-headed window openings and pedimental heads of our Italian Renaissance style, should not be so treated, instead of becoming mere masks of a defective construction. G. H. G.

Professor Wheatstone, upon whom it is said the Government is about to confer the honour of knighthood, was appointed Professor of Experimental Philosophy at King's College, London, in 1834. He was associate of the Ordnance Select Committee at Woolwich during the Crimean war, from 1855 to 1859, and a member of various other Government commissions. He has received the degrees of D.C.L. and LL.D. from the Universities of Oxford and Cambridge, and is corresponding or honorary member of all the principal scientific academies of Europe. He is also a Chevalier of the Legion of Honour, and has received two gold medals granted by Her Majesty and awarded by the Royal Society for attainments in physical science. He invented the concertina, the stereoscope, and the solar clock. He was the originator of the submarine telegraph, and his researches in electricity conducted mainly to the introduction and development of the electric telegraph in its present practical form as employed in this country. His latest invention is an apparatus for conveying instructions to the engineers and steersmen on board large steam vessels, which has received the favourable consideration of the Admiralty.

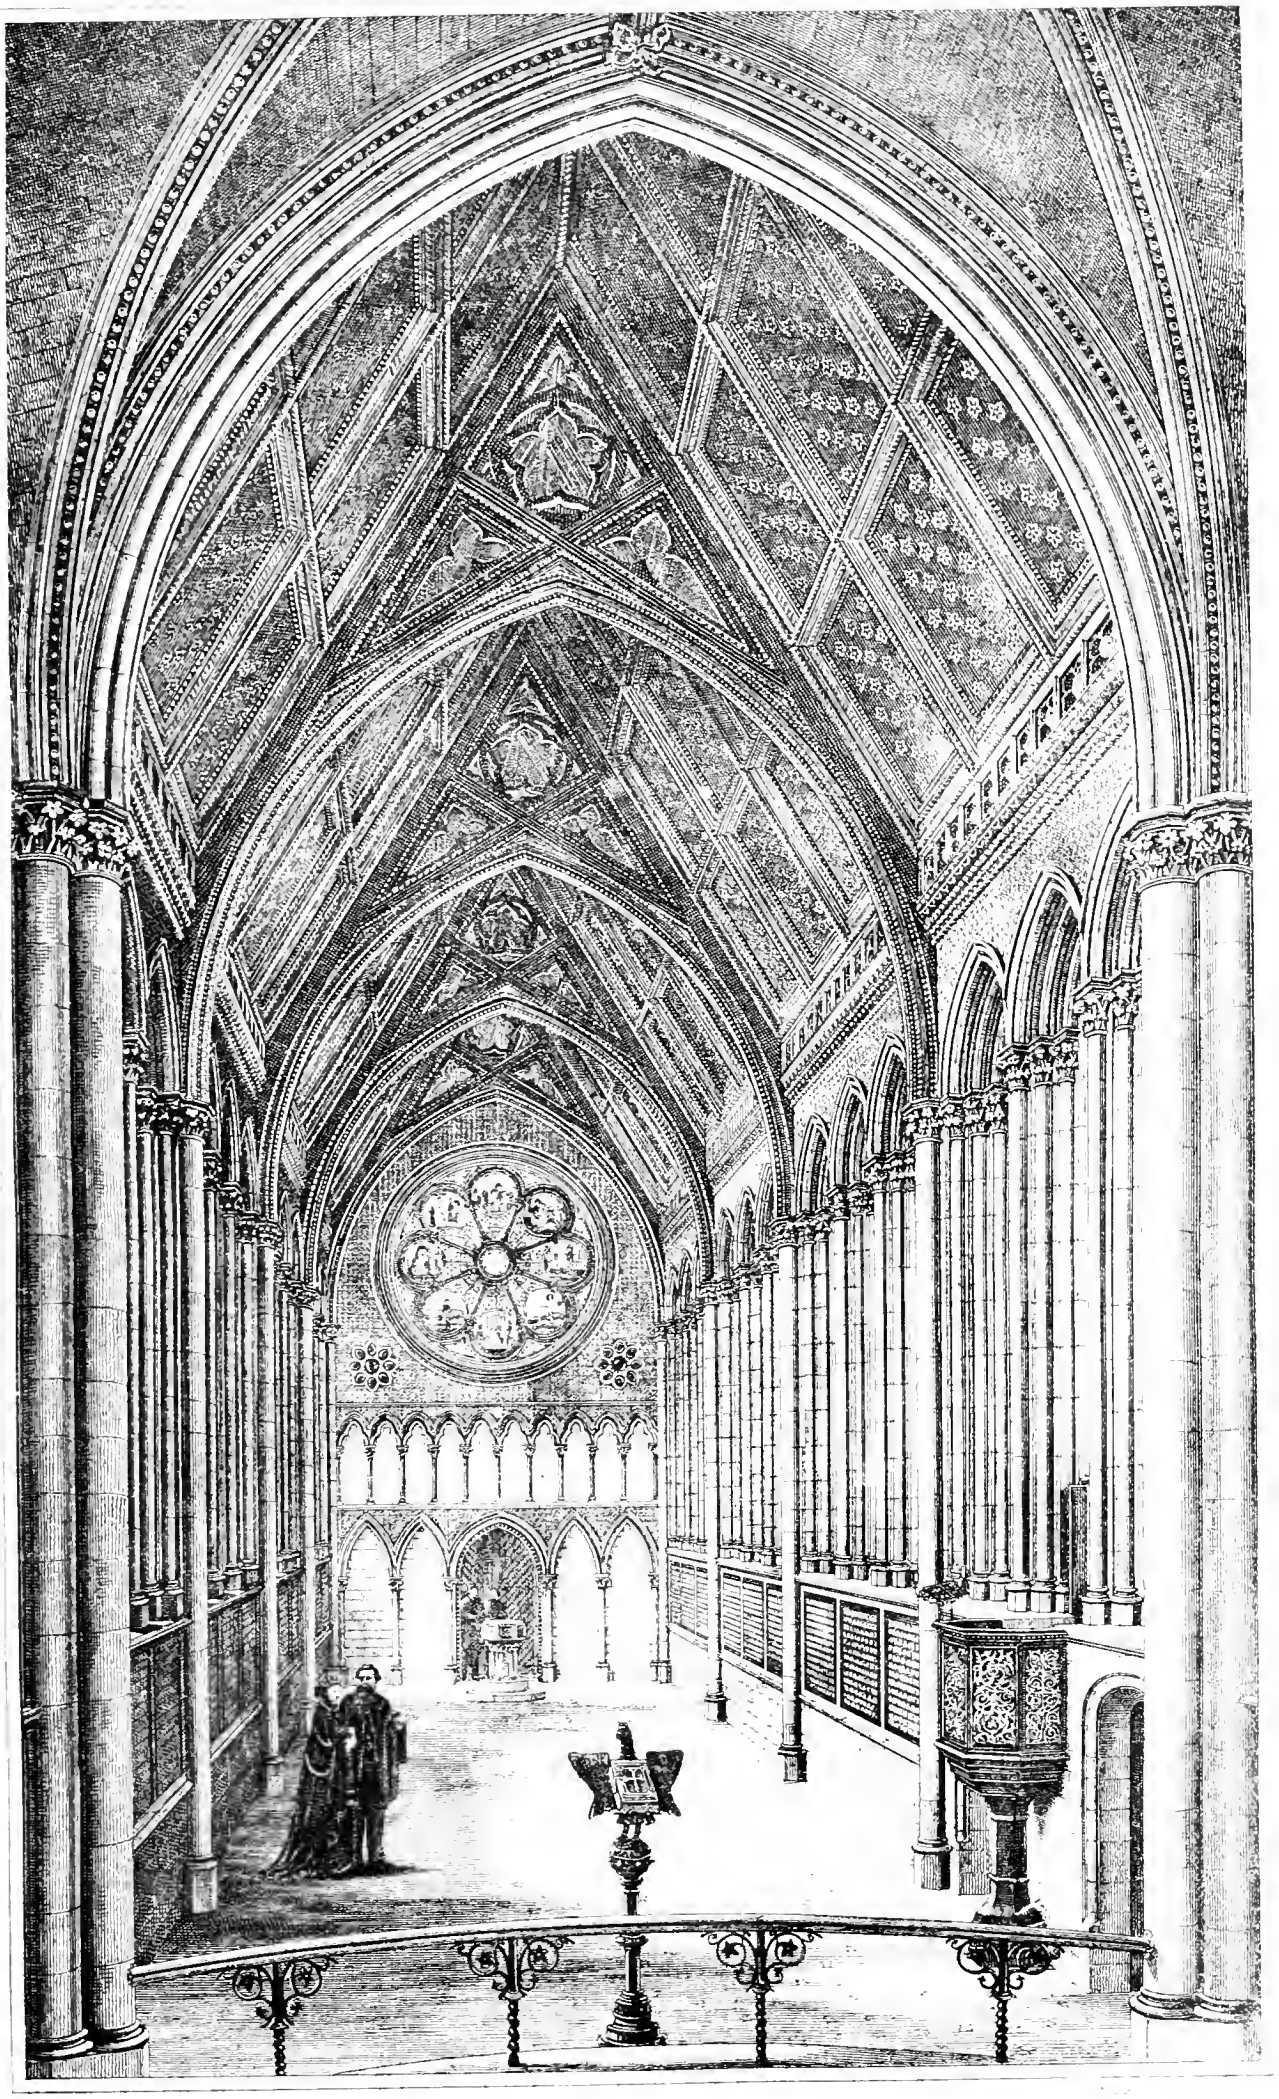
Mr. HENRY CONYBEARE, ARCHT.



St MARY'S, ITCHENSTOKE - INTERIOR

ST. ANDREW'S, HERTFORD.

ABOUT six years since an effort was made to rebuild this church, and about £2,000 were either paid or promised. A limited competition was invited, and four sets of designs were sent in; and those of Thomas Smith and Sons were selected. The word "selected" was written on the drawings by the rector, and there it now remains. A fancy fair was held for the purpose of getting together funds, when Messrs. Smith's designs were exhibited as those chosen. Illustrations of the designs were engraved on steel and sent, with a circular, to the leading men of the county, asking for subscriptions. The money not having come in sufficiently, the matter has remained for some time in abeyance. The rector, however, having left Hertford, his successor very naturally wishes to have a better church, and the affair is consequently revived. The committee met, but, strange to say, Messrs. Smith's designs are thrust aside, and a new unlimited competition is invited; and we hear that no less than ninety-four architects have applied for the necessary information for competition. We beg to ask the committee whether they think they are acting justly towards Messrs. Smith. No reason has been given why their drawings should be set aside, and we suppose there is no reason but that the new clergyman has, perhaps, some architectural friend whom he wishes to have the job. We hear that Messrs. Smith are not to be so easily extinguished as the committee may imagine, and that it is intended to ascertain what a judge and jury may have to say on the subject. The committee may say that, as they could not get the £3,800, which was Messrs. Smith's estimate, they intend having a smaller and cheaper church—one that should cost only £3,000. That, however, would be no justification for setting Messrs. Smith aside, as these gentlemen have offered to modify their plan to meet the necessities of the case. Their original plans provided for 650 sittings in the church and 182 in the gallery, making a total of 832, for £3,800. The new church is to have only 600 sittings for £3,000. The Messrs. Smith have given ample evidence of their ability to build excellent churches. It is well that competitors for the intended new church should be cautious how they deal with Hertford Church-building Societies; and if architects were animated by a true spirit, they would not, after knowing the facts, enter into the second competition.

PRIZES FOR ART WORKMEN AT THE SOCIETY OF ARTS.

BEFORE going through the various articles *seriatim*, it may be as well to make one or two observations upon the Exhibition itself, as well as upon the details of the programme, which have naturally affected the execution of the specimens. It is much to be hoped that the gentlemen who drew up the conditions may see their way a little clearer another year. Now, everybody knows that a sculpture in marble demands a very different treatment from a sculpture in stone: and yet the very first division contains a prize offered for a carving either in *marble or stone*, from a frieze by Donatello. Had any close-grained stone, such as lithographic stone, been specially mentioned, the mistake would not have been so bad; but an inspection of the copies executed in freestone, and the solitary one carved in marble, shows how very much the material influences the work. There ought either to have been a prize for marble, or a prize for freestone, or prizes for both; but the same model should hardly have been employed in each case. Again, by the programme we learn that the competitors could procure both a cast and a photograph of the model. This is surely wrong, for a photograph will often give a very different idea of an object from what we obtain from a cast. It appears only just that every man should be put on the same platform, and be supplied either with a photograph or else with a cast; certainly he should not be allowed his option.

As to the Exhibition itself, there are only two complaints to make—viz., that the objects are not placed in the sequence of their numbers (for instance, one of the human figure prizes in stone is in the hall, and the others upstairs), and that the casts of the originals are not supplied to the Society's rooms. It is true that most of the photographs are there; but still, for comparison, it would have been far better had the casts themselves been placed in juxtaposition with the copies. But, to return to the works, they are divided into two divisions—viz., works executed from prescribed designs—for which forty-six specimens have been sent in—and subjects sent without prescribed designs. These latter amount to sixteen. There are thirty-two additional works in wood carving, also without prescribed design.

Class I., of the first division, gives prizes for the best work executed in marble or stone, after part of a frieze of a chimney-piece by Donatello, in the South Kensington Museum, or a relievo in terra cotta; dimensions two-thirds the size of the cast. It is not easy to see why the latter condition was imposed, for Donatello himself, as well as every other good artist, would doubtless have found it necessary to introduce some modifications when treating the same subject in different dimensions. If the object of the authors of the programme was to exercise the workmen in such differences, it appears to me that they are beginning at the wrong end, and that our workmen are a long way off from the attainment of such technical minutiæ. At present we should be amply satisfied if they could only copy the real size in a decent manner. The terra cotta Amorini are evidently intended to be copied in stone; but why copy terra cotta in stone? Surely there are numbers of casts of beautiful works in stone contained in the Architectural Museum; but they mostly belong to the twelfth, thirteenth, and fourteenth centuries, the art of which periods does not appear to be in much favour either at South Kensington or with the authors of the programme. Three specimens have been sent in for this prize; but, inasmuch as they are all separated, and as the photograph is very small, it is rather difficult to ascertain how nearly they approach the original, which may be either a good or a bad specimen of the master. The work executed in marble shows how very superior that material is for the mode of treatment. Nobody appears to have gone in for the Amorini.

The next prize is for ornament. In this case the model is a carved chair-back, which, by the same strange perversion as noticed above, is to be copied in marble, stone, or wood—here the dimensions are also to be reduced. As far as can be judged by the photograph, the original is a rather average specimen of the time of Henry II., remarkable for nothing but an exceedingly comic lion's face, certainly about the last thing one would suppose to be recommended for study by art workmen. Two copies of this work of art are sent in, both in stone.

The third prize is given for a copy of a Gothic bracket in the Architectural Museum; but in this case we are informed that the details may be improved by the introduction of small animals, and the human head changed according to taste. It is a pity that it never struck the authors of the programme that the hideous Pagan chair-back might also have had its details improved with advantage. No one has gone in for the Gothic bracket, even with the permission to improve it.

We next come to something really practical, viz., work carved in wood, after a panel in carved oak. Three specimens have been sent in for this prize. As there is no photograph and no cast, we are obliged to fall back upon our reminiscences of purely Renaissance carving, for, of course, this is a Renaissance panel. Two of these specimens appear to have been enlarged, and the third, which we may presume to be the size of the original, appears rather lumpy for its scale. This finishes the stone and wood carving, for, although two other prizes are offered, there appear to be no competitors. The subjects consist of an Italian carved frame, and a gilt console table ornament of the time of Louis XVI.

We now arrive at the metal work, which forms Class II., and begins with the human figure as a bas-relief. The first prize is offered for a copy of the celebrated Martelli bronze mirror-case, attributed to Donatello, and now at South Kensington, dimensions, 6½ inches in diameter; or a panel in low relief of the Virgin and Child, in South Kensington Museum, dimensions one-third of the original—the material of the latter is not named, but it looks very like a marble bas-relief of Donatello. Only one competitor has gone in for the Martelli mirror-case, viz., A. Du Four. He has executed his work most admirably, and it is well worth the sum (£20) placed upon it. The material is wrought iron—the original is in chased bronze, another instance of the misapplication of materials.

Three specimens are sent in for the reduced panel of the Virgin and Child, of which No. 11 is the best. A prize is also given for the best imitation of a tazza in silver, date 1683. This has been responded to by Alfred Page, whose work is very creditable, except as regards sundry of the details of the figures, such as the wrists, &c.; but they may occur in the original, for few people would expect to meet with much good art belonging to the year of grace 1683.

Class III. is hammered work in brass, iron, or copper. The model is a knocker in wrought ironwork. A photograph alone is supplied. Three specimens are sent in—two in brass and one in iron. Of the brass ones, No. 15 is incomparably the best; in No. 14 the backplate is so beaten up as to be practically useless; and in No. 16, the iron specimen, it is not beaten up at all, and is cut out of too thick a plate of iron, whereas the photograph most distinctly shows it beaten up slightly, and executed on a very thin plate.

There is no competition for the carving in ivory, so we may go on to Class V.—chasing in bronze. Three specimens are sent in. The work is a panel in low relief of the Virgin and Child, the original being in marble. A rough casting in bronze, on which the chasing must be executed, was supplied by the Society at cost price. The panel in question is the Donatello Virgin and Child we have noticed as serving as model for the *repoussée* work in metal. In this case a rough metal cast ought certainly to have been put alongside the specimens, to show us what ground the competitors had to work upon, as also a cast of the original. The prize for ornamental bronze chasing is offered for a copy of a silver-gilt missal cover, a photograph only being supplied. Two competitors send in. One has executed his work, as desired, in bronze; the other evidently thought that a silver-gilt missal cover would be most properly copied in silver, and has, accordingly, very logically executed his work in that metal.

The Goldsmiths' prize for etching and engraving upon metal is the next on the list. The subject given is an arabesque ornament (an exceedingly well known one) of Lucas Van Leyden. Mr. Hindly, an apprentice of Messrs. Garrard and Co., has produced a very fair copy on silver; so has G. B., on ivory; although both have failed to produce the energetic ugliness apparent in the faces of the original engraving. G. B. has filled up his work with black, and we are thereby enabled to judge of it more easily than in the case of his competitor, who has left his plate as it came from the burin: he should have blacked in at least one half of it. Space compels me to pass by the sections of painting upon porcelain, engraving

on glass, die-sinking, glass-blowing, and book-binding, and to confine my observations to the three remaining sections, which are more particularly connected with architecture, viz., decorative painting, wall mosaics, and illumination.

Two prizes are given in decorative painting. The first, for a work executed after a photograph of ornament by Aldegrever, and the other, after a picture-frame at South Kensington. As usual, three works are sent in for the ornament, but in all three there is a want of knowledge of the human figure; in fact, one specimen is very bad indeed. The one competitor for the picture-frame has simply copied it, as if it were marble, with a few gold lines here and there. It is a laborious piece of work, and looks very much as if due to South Kensington teaching.

For illumination, a prize of £5 is offered for the best copy of an altar card, attributed to Giulio Clovio, at South Kensington, or from an MS. border, date 1450, also in that museum. The dimensions are to be one half larger than the photograph; this is probably to obtain the size of the original, as anything more absurd than enlarging or diminishing an illumination can hardly be imagined. How is it that the authors of the programme have consented to ignore the great ages of illumination, viz., the thirteenth and fourteenth centuries? Miss David has made a very excellent copy of the fifteenth century MS., although it leaves something to be desired as regards the figures and the burnished gold. It is strange what a mystery and difficulty is made of this same burnished gold, and how many preparations are sold for its production, when the process can be learnt from any picture-frame gilder. Of course, a certain amount of experience in the manipulation of the burnishing gold size has to be obtained, but that, as well as the use of the burnisher, is a mere matter of time—people cannot expect to acquire in one day or one week what it takes an apprentice years to learn, I mean with regard to the manipulation; for the process is no secret at all. The other copy of the fifteenth century example is by no means so successful. The copy of the Giulio Clovio is very neatly and carefully done, but does not involve the same difficulty as the other specimen.

Among the specimens sent in, without prescribed design, is an illuminated page, in the style of the early fourteenth century (No. 59). The ornament, the birds, and the grotesque animals are very well done, but the angels are very unlike those of the period, although the inspiration has been sought in Fra Angelico; the gold, as usual, is a failure, and the writing is a mistake. A little more careful study of ancient examples and of the human figure, would make the lady artist proficient in this style of illumination.

Only one competitor appears for the mosaic prize (a female head to be executed after one from Raphael's cartoon of the Beautiful Gate), and he has worked his subject in only two colours, viz., a brown head upon a blue ground. The effect is not brilliant, as mosaics ought to be; and, in fact, does not do justice to the workmanship, which is very good.

No less than thirty-two works have been sent in to the second division, viz., Wood carving without prescribed design. Only two stand out from the rest, viz., the Neptune, carved in walnut wood by Charles Liddle, and the frieze from "Midsummer Night's Dream." The latter betrays great energy in the action, and some parts of it are exceedingly well carved; had it been finished, a more decided opinion might be pronounced upon its merits, which it is almost impossible in its present state. The figure of the boy who has fallen down appears very much out of drawing, as regards the bend in the back. It is to be desired that next year Mr. Leach will favour us with a complete specimen of his skill. The authors of the Statue of Daphne and the Nativity of Cain would both be the better for some careful studies in anatomy, more especially the latter competitor.

Next year it is to be hoped that this Exhibition will be far more successful, both as regards the number of works sent in and as regards their merit. At present the affair is very uphill work. The Society of Arts have not room to exhibit the specimens as they ought to be exhibited, the masters do not always allow their workmen to compete, and the programme might be improved with advantage by the introduction of a few more mediæval objects, and by the reduction of the heavy, lumpy Renaissance work which seems so much in favour.

It is also to be desired that there may be fewer gaps in the catalogue, as compared with the programme. Thus, we find that some branches of industry are not represented at all—*e.g.*, enamel and ivory carving; but, after all, what is wanted is to get hold of the apprentices, and to make it a point of honour with them to have obtained a Society's prize. As to the workman proper, he generally remains pretty nearly as he was a year or two after his apprenticeship.

W. BURGES.

EXETER AND ITS NEIGHBOURHOOD.

OUR readers will be glad to hear that in the above city improvements are taking place, and these of such a nature as to give satisfaction to all lovers of architecture. Those who are acquainted with the "faithful city" of the West will be the more gratified at this, for to whom does not Devonshire afford sunny memories? The cathedral, with its stately towers, elaborate west front, and almost faultless interior; the superb High-street, many of whose houses still retain rich and quaint old wood carvings upon their picturesque fronts; the curiously antique and tumble-down Guildhall, looking as if the first "Pickford's" that by chance may graze its projecting columns will bring the whole fabric to the ground; and the far-famed figure of "Father Peter," at the corner of North-street—all these are objects upon which much has been, and could be, written. Our object, however, is not to dwell on these, tempting as their topics are, but to speak briefly of the new buildings and restorations which have been in progress during the past year of 1867.

Most prominent of these, then, is the Albert Memorial Museum, in Queen-street, now nearly finished, and erected from the designs of Messrs. I. Hayward and Sons, of Exeter. The style is Early French Gothic, and there is a purity of feeling pervading the whole that renders it a building of great merit. The internal arrangements are excellent, and give great satisfaction. We doubt not, therefore, that in its double capacity as a museum and school of art great advantages will be reaped by the city. There is a large amount of excellent stone carving, the whole being as successful a specimen of simple conventional ornament as we have yet seen. This may be attributed principally to the zeal of the architects, who have spared no pains in instilling true artistic feelings into their carver, encouraging him during the progress of the work to visit the rich cathedrals of Normandy, and placing their valuable library at his disposal. In a finely carved niche on the grand staircase a figure of the Prince Consort will be placed as soon as it arrives from the studio of Mr. Stephens, of London, into whose hands it has been entrusted—Mr. Stephens, by-the-bye, being himself a native of Exeter. His marble figures of Sir Thomas D. Acland, on Northernhay, and of Earl Fortescue, in the Castle-yard, are works of the highest order; and I trust the one of the Prince will be equal to either in its vigour. The last production we have of his chisel—John Dinham, Esq., on Northernhay—fell considerably below our expectations; and his Gothic figures upon the restored part of the cathedral's west front are exceedingly poor. I hope he will seize this opportunity of retrieving his somewhat fallen name. The building will be open at Easter, when a bazaar will be held to raise funds for erecting the right wing, which yet remains to be built. Mr. E. Luscombe, of Exeter, is the contractor.

The handsome church of St. Michael and All Angels, on Mount Dinham, erected by Mr. Gibbs, is fast approaching to completion. On the 13th the spire was finished, and a gilded iron cross, 10ft. high, fixed on the apex. The spire is 225ft. high—twice as high as the cathedral towers—and can be seen for miles around. The organ is fixed, and a beautiful west window of stained glass adds greatly to the general good effect of the interior. There is some good stone carving on the nave capitals, and over them corbels of natural foliage of considerable merit. The benches are of oak; and, altogether, this bids fair to be about the finest church in the west of England. Mr. Hawkins, of London, is the architect; Mr. Peter White, of Vauxhall-bridge-road, the contractor—he also finding the carving, most of the angels being executed in London and sent down.

The Church of St. Mary Major, situated in the Cathedral-yard, and regarded as the oldest in Exeter, was taken down in 1865, and has been rebuilt from the designs of Mr. Ashworth, of this city. The style is Early English, and the whole of the available stones from the former edifice have been re-faced and worked in as far as possible. The church was opened for public worship on the first Sunday in 1868: it consists of a chancel, nave, and south aisle, the two latter being separated by rich clustered marble columns, surmounted by carved Portland capitals. There is a deal of ornamental carving on the interior, and outside as well; all of it being very fair. The benches are of oak, and open. The tower will be surmounted by a spire, but this will stand over for the present. Several old carvings—preserved from the ancient church—are introduced, the most curious representing the martyrdom of St. Lawrence, the poor, unfortunate individual being stretched upon a gridiron, one of his two fiendish executioners being in the act of turning him over with a long pole. This stands in the tower, and near are a number of the monuments from the last church. In the chancel arch are inserted two interesting corbels of early work; these are in a capital state of preservation. Mr. Tozer was the contractor—Messrs. Mitchell and Son doing the stonework and supplying the carving. The cost has been about £6,000. Another ancient church, that of St. Mary Arches, is being restored. Some of it is Norman, but the major part Perpendicular. Messrs. Hayward and Son are the architects. The church of St. Martin's has had its exterior renovated, the tower restored, and a new porch erected. Mr. Best, of this city, was the architect. The parish church of Rewe, near Exeter, has also been restored, as far as funds will permit, under the direction of Mr. Ashworth; the builders being Messrs. Stephens and Son, of Exeter.

The pretty and elaborate church of Clyst, St. George, situated about five miles from Exeter, is undergoing some additions. Under the superintendence of the rector, the Rev. H. T. Ellacombe, the altar is being carved and enriched by Mr. Harry Hems, sculptor, of London; and some wood carving for the roof is in progress by Mr. Ship, of Bristol. A new porch has also been erected over the entrance-gate to the grave-yard.

A new chapel, from the designs of Messrs. Habershon and Pite, of London, has been built at the neighbouring town of Exmouth. It is in the Geometrical style. There is a little decoration outside in the shape of some stone carving, which is executed with good taste.

The largest and most important building in progress in this neighbourhood is that of Marley House, the residence of John Bryce, Esq. This is an immense mansion situated between Exeter and the sea, and built upon the site of a former house. The total cost will be from £30,000 to £40,000. Mr. Benmore, of Exmouth, is the architect, and Mr. E. Luscombe, of St. Sidwell's, Exeter, contractor. There are several other large works now on hand—the asylum at Wonford, the new hotel at Exmouth, &c.; but these we must leave for reference at another time. J. V.

OBITUARY.

The death of Dr. John Davy, the brother and biographer of Sir Humphry Davy, and eminent as a chemist, geologist, and physiologist, took place on the 24th inst. Dr. Davy displayed an intimate acquaintance with, and had written largely on, the sciences of meteorology, geology, and chemistry. One of his most recent works consists of a series of "Lectures on Chemistry," in which this science is regarded in its relations to the atmosphere, the earth, the ocean, and the art of agriculture. He was a fellow of the Royal Societies of London and Edinburgh. Dr. Davy was born in Penzance, in Cornwall, in 1790.

Building Intelligence.

CHURCHES AND CHAPELS.

On Tuesday week the Bishop of Lincoln consecrated a new church at Dembleby, Lincolnshire, lately erected. The structure is in the Norman style, and was built from the designs of Mr. Kirk of Sleaford, at a cost of little over £1,100.

The annual meeting of the Leeds Church Extension Society was held on Wednesday week, under the presidency of the Mayor of Leeds. The report, which was read by T. G. Teale, stated that the board, during the first two years of its tenure of office, had spent over £11,000. In development of the scheme for parochial rearrangement, the board has formed the nucleus of two additional parishes, and has also undertaken the commencement and continuance of other projects. For the accomplishment of these, however, additional funds are urgently needed, and for these the board earnestly plead.

A chapel of ease has just been completed at Calton, near Stamford Bridge, and has been consecrated to St. John the Baptist. The architect is Mr. G. F. Jones, of York, and the chapel has cost £1,500.

An influential meeting of the friends of the York Diocesan Church Building and Endowment Aid Society was held at York last week, under the presidency of Earl Fitzwilliam. The Archbishop of York, who was present, ventured to express the hope that if, for another ten years, they were able to continue the grants in the same proportion, they would, by increasing all endowments below £100, wipe away that which at one time was a disgrace to the Church and to the landed interest of the country. Resolutions were passed commending the society to the enlarged support of churchmen, and requesting the archbishop to issue a pastoral, recommending parochial collections in its behalf. Before the meeting separated sums amounting to between £6000 and £7000 were promised.

EDINBURGH.—At a recent meeting of the subcommittee appointed to take steps for the improvement of St. Giles's Cathedral, Mr. R. Matheson, of Her Majesty's works, showed plans of the proposed improvements, which were cordially approved of. The intention is to open up the building on the comprehensive scale adopted in the Cathedral of Glasgow; but in the meanwhile the alterations are to be confined to the choir or high church. The perspective view of the interior of the choir shows the gallery taken down, a new pulpit at a low level, and the whole of the seats, with rows of stalls along the sides, in the elegant style of the King's College Chapel at Old Aberdeen. The estimated expense is £3,500.

SALISBURY.—Last week special services were held in the parish church of St. Thomas to celebrate the extensive restoration which has taken place, at an expense of nearly £2,000, of the chancel of this edifice. The church, which is a fine example of the architecture of the fifteenth century, is dedicated to St. Thomas à Beckett. It was erected as a chapel of ease to the cathedral, and consists of a nave and two aisles, a chancel with two aisles, and a square and lofty tower on the south, containing a magnificent peal of bells. The interior is very spacious, and contains many specialities of interest. The roof of the nave is of oak, trussed, and over the crown of each arch is the figure of an angel bearing a shield, a similar image being in the middle of each side. The aisles are also roofed with oak, divided by cross-beams into compartments, and the intersections adorned with bosses. In the middle and at each side are a series of figures of angels bearing shields. Among other objects of interest in the church there is a large monumental tablet, which never fails to attract the attention of strangers, carved out of a solid slab of oak, representing some events in the history of the Patriarchs, with the inscription underneath, "Here underlyeth the body of Humphry Beckham, who died the second day of February, 1671, aged 83. His own worke." The restoration works have been carried out under the direction of Mr. G. E. Street. Above the communion table is a fine reredos, containing a crucifixion sculptured in alabaster, with a coloured diaper background, executed by Mr. Earp, of London. Twelve clerestory windows have also been filled with stained glass by Messrs. Harland, of Frome. The contractors for the works were Messrs. Rogers and Booth, of Gosport.

BUILDINGS.

The new Post-Office at Bristol will be ready for occupation in about two months. It is in the Grecian style; the frontage is 70ft., the depth 130ft., and the height 60ft. The cost of the building is between £12,000 and £13,000. It has been erected by Mr. James Diment, builder, from plans prepared by Mr. Williams, from the London office of the Commissioners of Public Works.

The works of the new building intended for St. Thomas's Hospital are very far advanced, the brickwork and masonry of the basement floor being completed; and the walls above the surface are being constructed in a massive and substantial manner.

A preliminary start has been made in the matter of the new city improvements at Edinburgh. The arrangements for the purchase of a large block of buildings in the first section of the plan have been completed. This block, which lies between Canongate and Cowgate, and is intersected by fourteen narrow closes or wynds, contains several relics of the olden time, some of which will have to be swept away. There is the site of the Episcopal Chapel in Blackfriars-wynd, date 1722; the mint, formerly the mint of Scotland, which dates from 1573; the Journeymen Freemasons' Lodge, occupied by them for upwards of a century; Oliver and Boyd's printing and publishing offices, formerly the Marquis of Tweedale's house (seventeenth century); and the palace of Archbishop Beaton, which belongs to the sixteenth century.

We understand the legal arrangements for the Keble College at Oxford were completed on Monday, and that building operations will soon be commenced. The site is one of the best out of Oxford, being near the New Museum.

A block of model dwellings intended for a class somewhat above ordinary mechanics and labourers has been erected in The Mall, Kensington. The building contains forty-eight separate tenements, approached by well-lighted stone staircases. The amount of accommodation differs to suit large or small families—sixteen tenements having one bed-room, while twenty have two bed-rooms, eight have three bed-rooms, and four have each four bed-rooms, in addition to the living room of each residence. The rooms are all lofty, and provided with fireplaces, and with sash windows opening at top and bottom—a plentiful supply of fresh air is introduced through a system of hollow walls, ensuring ventilation without draught. The roof is flat, affording a drying-ground, and an extensive open space is set apart as a playground in the rear. Mr. James Murray, of Portman-street, is the architect, and Messrs. Lucas, Brothers, are the builders.

The new Townhall, Ipswich, was formally opened on Wednesday. The building is in the Venetian style. The front façade has a projecting open arcade, supported on Corinthian columns, over which are statues representing Justice, Learning, Commerce, and Agriculture. In the centre of these are the arms of the borough in alto-relievo. Above the crowns of the arches forming the arcade are three medallions, in which are placed sculptured heads of Cardinal Wolsey, born in Ipswich in 1741; and Richard II. and John I., who both granted charters to the town. The hall has also a clock-tower 120ft. high, with a clock by Dent; this clock has a good toned bell of 16cwt. Directly opposite the main entrance is a Sessions' Court, 38ft. by 34ft., and 33ft. high from the floor to the dome. On the right of the main entrance is a magistrate's room, 31ft. 6in. by 26ft. 6in., and 19ft. high. A grand staircase leads to a vestibule through which one passes to the Council Chamber. The decorations of the hall, grand staircase, and vestibule are very rich; the staircase is 32ft. long by 24ft. wide. The Council Chamber occupies about the whole length of the western side; the length of this fine apartment is 74ft., the width 31ft., and the height 26ft. On the left of the Council Chamber is a library, 40ft. by 31ft., and 24ft. high. Messrs. Bellamy and Hardy, of Lincoln, were the general contractors; and the cost of the hall has been about £16,000.

WATER SUPPLY AND SANITARY MATTERS.

The borough engineer of Liverpool, in his evidence the other day before the Rivers Pollution Commissioners, stated that the borough of Liverpool extended for about six miles north and south of the margin of the Mersey, and about two miles inland. Up to the year 1846 the sewage was discharged into the dock basins, but there had since been constructed, under his superintendence, 210 miles of sewage works, with eight outlets into the river; and the bulk of the sewage was discharged at the extreme north and south ends of the town below low-water mark.

The Child's Hill (Hampstead) Drainage Committee invite schemes for the best mode of carrying out their powers under the Sanitary and Sewage Utilization Act. The engineer whose scheme is selected will be employed, upon the terms to be arranged between the committee and the engineer, but the committee do not pledge themselves to accept any of the schemes submitted. Plans and estimates must be forwarded to Mr. A. T. Cox, the secretary, on or before the 10th of February next.

TO CORRESPONDENTS.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

Correspondence.

MR. FERGUSSON AND MODERN ARCHITECTURE.

To the Editor of the BUILDING NEWS.

SIR,—Mr. Fergusson should have been a bishop; he could then have pronounced dogmatic decisions, which, if not privately undisputed, would, at all events, have been publicly received in solemn silence. He must not, however, be permitted to rate a whole institute of architects with impunity; and it seems to me high time that some protest was made against his self-assumed authority. He always speaks and wishes to be recognized as having spoken *ex cathedra*. Hence, when another man would reason, he takes upon himself to judge and decide categorically, as though every one were hanging on his lips for a decree; noticing just as much of the matter under his consideration as is convenient for his own immediate purpose, whether of personal depreciation or general abuse. Passing by other instances of this spirit, let me remark, in regard to that more immediately interesting to myself, that he assumed the office of judge—so Dr. A. Barry protests—before having heard the pleadings of both sides, because this afforded him an opportunity of mounting his favourite hobby for general observations, and of abusing my father in particular. Regardless of justice, on one hand, he is taken to task for summing up *against* evidence; for I am sure that, if one half of my evidence proves to Mr. Fergusson's mind that my father spoiled the original designs for the Houses of Parliament, it can scarcely be disputed that the other half very much more forcibly proves that he made the original designs. Now, however, Mr. Fergusson shirks the real question altogether; and, after introducing one quite irrelevant, covers his retreat by a second question of an entirely abstract nature, even more irrelevant than his first. I will, nevertheless, follow him, as it concerns not only myself, but the whole body of living architects, not to speak of the army of architects who have lived since the year 1500.

Without taking any particular credit to myself for the faculty, I claim to be competent to distinguish between archæology and architecture; and at the same time I do not acquiesce in Mr. Fergusson's teachings or definitions. In opposition to him, I define an archæologist—*i.e.*, a mere architectural archæologist—to be one, who, in making designs, not only studies the works of antiquity as a book whereby he may learn the principles of the art which produced them, and see how these principles were variously developed by successive architects, in what forms they resulted, what ideas

sprang from them, how they were influenced by, and in what outward expression they satisfied and symbolised, the wants of the then existing generations, but actually reproduces such works, irrespective of all considerations of appropriateness, and modern wants, convenience, and requirements, thus making the present subservient to the past, and expressing, not the thoughts and character of his own mind on the age he lives in, but those of men and ages long since departed. A good architect, however, must be a sound archæologist. In designing a building, whilst considering solely "the purposes and age for and in which it is to be erected," he will work it out from his own thoughts and brain power, without reference to books and examples; but, so far from "not thinking of the past, or of any other clime," or unreservedly rejecting the forms and developments of bygone ages, he will bring to bear on his work the wisdom, genius, and power of the great men by whom they were produced. Far, moreover, from fostering a supercilious disdain for them, he will avail himself of their experience and reverence their works, even to the extent of designing the self-same features and using the self same forms for the same wants. It is a shallow philosophy, which, from a morbid desire of being novel, or a slavish fear of being a copyist, shrinks from a loyal avowal of the obligations a man is under to those from whom he has learnt the very alphabet and grammar of his art. In saying this, I am not likely to be misunderstood. No man has more roundly abused archæological whims and old-world copyisms than myself; and none have been more soundly abused for so doing. But I denounce quite as strongly a principle such as that enunciated by Mr. Fergusson, which, followed out without qualifications, leads to nothing but extravagance and eccentricities. The partial truth it contains requires carefully guarding by the principle of authority; and a reverence for the past is the best guarantee for success in the present. This seems to me to be the great safeguard against a spurious originality, which, if sought for apart from the restraints I have mentioned, only results in the weak, crazy, and fantastic developments of modern Paris and London. To throw archæology overboard "in order to get at a real and true architecture," is very much like discarding grammar in order to write with real and true elegance.

All that is true in Mr. Fergusson's definition of an architect has been the burden of my song for many a day; but what he really means is to be found in his article in the "Builder," on the Law Courts, which, although containing much that is both true and admirable, is so disfigured by his usual extravagance that it loses half its value. His ideal architect, it seems, is to cut himself off from "the past, and from every clime" under the sun, except his own. He is to free himself from "the trammels of archæology," and to invent a new style, with no principles but "common sense" and "progress" to guide him. He is to engage on every fresh work with the amusing conviction that "Gothic (English) spires and Grecian porticoes are equally absurdities" in England; that all modern architecture is "a falsehood,"—Classical, one falsehood, Gothic, another; that a love of Gothic art is a mania to be classed with crinolines and chignons, and consigned with them to the limbo of absurd fashions; that veneration for the Middle Ages is "sentimental;" and (if I rightly understand Mr. Fergusson) that neither "pointed arches nor classical pillars" should be tolerated. With such convictions and in such a spirit, a man is to be successful in producing an original and entirely satisfactory style of architecture, "in harmony with the feelings and advancement of the age." Will Mr. Fergusson, for once, be a little less visionary and a little more practical, and give us some idea of the "original, common-sense architecture" about which he discourses so dogmatically? There are several newly-erected buildings in London, which seem to be, at least, efforts in Mr. Fergusson's right direction. The Charing-cross Hotel is wildly original, details and all: does that please him? The Strand Music-Hall has certainly no parentage: surely, this cannot be far wrong. Better still, the new University Buildings in Burlington-gardens, which were pulled down last summer and bodily carried off when but half erected: these, at all events, ought to have passed Mr. Fergusson's muster, for they they were totally unlike anything ever yet seen, not only in design, but even in their general construction and masonry.

In these buildings we certainly find few "crotchets," such as those Mr. Fergusson so flippantly attributes to my father; but a mass of childish fancies, ludicrous abnormal conceits, and fantastic originalities. My father's "crotchets," at all events, had authority on their side; but these are the coinage of the most depraved taste, opposed alike to all "true and real architecture," as to every rule of art. These, then, are the results of a principle such as that we architects are called upon to adopt; these are the will-o'-the-wisps we are to follow in our search after "a new style neither Gothic nor Grecian," until we are lost in a quagmire of incompetence and conceit. Space forbids me to follow Mr. Fergusson any further. Perhaps another opportunity may be afforded me of noticing the "syllabus of errors" with which he has favoured us; but I do not think, since we are all such benighted creatures, that we cannot even appreciate the difference between "archæology and architecture," and that all architecture since the year 1500 has been more or less a failure. Mr. Fergusson, in addition to his darling occupation of finding fault, might take the trouble to build up as well as pull down, and substitute something "true and real," for the strange alterations of the present day. We might then place a higher value on his crusade against all modern architecture and architects.—I am, &c.,

E. WELBY PUGIN.

COMPETITIONS AGAIN.

SIR,—Your correspondent of last week—Mr. A. W. Phillips—acted neither "wisely nor too well" in selecting the case of St. Andrew's, Hertford, as a vehicle for exposing a system which, but for such pernicious instances, would be a valuable institution. Although, from "prima facie" evidence, it was palpably evident that the selection would terminate locally, the paucity of information given as to the site, &c., and the puerile invitation for competing architects to visit the same, being sufficiently indicative of that intention on the part of the committee, it had, to a certain, or rather *un*-certain extent, one redeeming feature—the probability of the favoured individual being engaged as architect on the usual terms. The above-mentioned case is completely put into the shade by the particulars furnished for partially re-building St. Mary's, Lichfield, which is as follows:—

SIR,—In reply to yours, I send you copy of resolution:—That instructions shall be given to any architect who may be willing to compete to rebuild the present church, in unison with the present spire, to seat 1,000 to 1,100 people, and not to cost more than £6,000. Designs to be sent to me on or before February 1, 1868.—I am, &c.,

Jan. 16, 1868. R. CROSSKEY, Churchwarden.

The above was written on headed note-paper, Rock and Co., No. 3172, with "St. Mary's Church, Johnson's house, and monument," depicted thereon; and this, forsooth, was considered sufficient bait to catch competitors. Architects must be clever individuals to surmise correctly the dimensions and date of the former, and the size of the site of St. Mary's, from such information as the above; and must be, moreover, great fools to expend the requisite time, talent, &c., without even a prospect of obtaining any remuneration whatsoever. This instance is all the greater exhibition of "nerve" when it is known that the vicar of St. Mary's has guaranteed £4,000, and that the friends of Bishop Lonsdale, in whose memory the edifice is to be erected, have also promised substantial assistance towards the required amount.

Another mild instance of "nerve" which lately came under my notice, was that of an individual who, under the misnomer of "£ s. d.," invited designs for a villa residence to cost £700 or £800; the bait in this case being £3 3s. Really, Sir, you can expect to see nothing but "inalienable rubbish" in competitions under existing arrangements. Cannot this state of things be possibly ameliorated?

Innumerable instances of this kind might be adduced, and more are turning up daily; but for the present, "hold, enough." With apology for such extensive trespass on your valuable space, I am, &c.,

F.

January 28, 1868.

DARLINGTON WORKHOUSE COMPETITION.

SIR,—Having read, in your impression of the 17th inst., an article on the designs sent in for the Darlington New Workhouse, and having occasion to visit the north, I thought it would be a convenient opportunity to call and see them at the Hall of Exhibition, in Darlington. With your paper in my pocket I entered the room, and at once found the designs of "Alpha," on the left of the hall. It occurred to me as being very strange, whilst reading the criticism, that the author should leave out twelve sets of plans, and only criticise the above one in the way he has done, because, if guilty of all these faults, it was not worthy of comment at all. Therefore, I examined the plans very closely, referring to the paper from time to time, and at last came to the conclusion that some unfair work and means had been used to seriously effect them. Taking the first objection, as to the plans not being scaleable, and being in the profession myself (although no pencil, paper, or scale could be used), I managed, with the aid of my stick and thumb, to check over the lengths and heights, which I found to correspond and agree one with another, and I positively say that these plans would answer for working drawings, for the sizes could easily be taken of them to build from. But this critic gets out of it again by saying doors and windows, at any rate. We shall hear of that in its proper place, when we arrive at the matron's room.

He then writes that the elevation is coloured red. Undoubtedly it is, and so are all the others coloured, and some with far more pretension than the one in question; but looking at the view, where colouring is strictly forbidden, I find that it is carried out to the very letter (the conditions being that all views or perspectives must be in outline only, or etched in with a pen), and I could not find that a brush had been used on it at all.

But I did find that one of the designs he recommends (I shall not mention "motto," as it is unfair) is coloured as much as it could be, and the author of it has tried as much as possible to convey to his inspectors how it would look when on fire. He then proceeds and makes the unblushing statement that in the centre of the house is the kitchen, with nothing to prevent smells, and that there is no back kitchen, or any necessary adjuncts thereto. On examination, I find that the kitchen, instead of being in the house, is leading from it through a large open area, dividing the same off into two large yards, then again into two small private ones, so as to keep children from looking into the windows which look into the private yards, and each window giving abundance of light therein, and capital ventilation. Near the end, at one side leading out of the main kitchen, I find a large open back kitchen or boiler house; also leading out at each side of main kitchen are small passages, one side taking you into a large open dairy, pantries, &c., the other, into houses for plate, bread, provisions, baking, &c., &c., with all the necessary accommodation that a house could possibly require.

The writer goes on to say that the matron's room has no light therein, and is 23ft. from any window. This is evidently stated for a purpose, as there is a large light or window into the private yard; and, moreover, this is not the matron's room, it is only an office for the master or matron to sit in, to see what may go on whilst the inmates are dining. The matron has her private sitting room, and a bed-room adjoining, near the old people, in order for quick and better attendance, each of the rooms having two windows therein.

He then proceeds to the dining-hall, and writes that there are bed-rooms over the same. This is utterly false—there is not one at all. On looking at the first floor plan, it distinctly shows to be roofed and slated in, and a section is absolutely made to show the dining-hall and kitchens, which clearly shows them to be only one storey high.

The next thing is he wants to know what has "seduced" the author to do away with corridors. Why the very fact of having the sexes divided into four—men, boys, women, and girls—does away with that expensive confusion and grouping together of the different sexes, having each a separate house, as it were, to themselves, with all necessary conveniences thereto, and staircases separate, so that the inmates can go in and out of each room without going through the others; consequently, no corridors are required, thus, not only saving expense, but receiving more light in having windows out at each side instead of one. The only fault I can find is that the designer ought to have had a covered verandah along the centre of the workshops and provision stores, leading into the dining-hall, so that the inmates could have walked therein under shelter, which would also have answered admirably for a walk or promenade for the old people, and, with this slight addition, the plan would not only be an original one, but distinct and perfect.

I examined the whole of the other designs, which present to the eye a very beautiful and striking effect, but writing a criticism on them, as to their merits and demerits, I consider unfair until the prizes are awarded; but in this case of slander and libel against "Alpha," I do consider it the duty of anyone to reply and correct these infamous accusations, and let your readers know the truth, exposing the infamous lies that this writer has had the unblushing impudence to invent and commit to paper.

When I stood before the designs your correspondent admires, it more and more convinces me in my first idea, that he was a competitor himself, and had to use these means to bring his designs into note. But out of evil sometimes cometh good, and I feel certain it will prove itself in this case, when the gentlemen who have the same to settle give their decision. In conclusion, this writer, to figure the comment he has written off to advantage, is obliged to copy the words of Mr. Charles Dickens, without giving to that distinguished gentleman the credit thereof, showing clearly that he has no originality, no qualification as a competitor, or any respect for himself as a gentleman as regards the truth, and believes in nothing, unless it has been done for him to copy off before.—I am, &c.,

FAIR PLAY.

Intercommunication.

QUESTIONS.

[726]—ZINC.—It is well known that iron rust penetrates the body of the metal, and that when once the process of oxidation has begun it goes on very rapidly. Would some of your readers inform me whether zinc is affected in the same way when exposed?—R. S.

[727.]—QUANTITY SURVEYORS' LIABILITY.—Can any of your correspondents inform me whether or no a person endorsing bills of quantities with his name and address would be considered solely responsible for their accuracy, even if he has received a portion only of the surveyor's commission?—B. B.

[728]—GOLD LACQUER.—If some one of your readers would kindly inform me how I may make a good gold lacquer I should be obliged.—WHITBY.

[Gold lacquer may be made as follows:—Put into a clean 4-gallon tin 1lb. of ground turmeric, 1½oz. of powdered gamboge, 3½lbs. of powdered gum sandarac, ¾lb. of shellac, and 2 gallons of spirits of wine. After being agitated, dissolved, and strained, add 1 pint of turpentine varnish, well mixed.]

[729.]—HYDRAULIC CEMENT.—Will you inform me at about what temperature a hydraulic lime should be calcined, and also what are the clays best adapted for the manufacture of artificial puzzolana?—A READER.

[730.]—VOLUNTARY ARCHITECTURAL EXAMINATION.—Can you inform me whether the voluntary examinations in connection with the Royal Institute of Architects are still held as formerly, or whether the scheme has been abandoned? The reason of my asking is that I have not seen the advertisements this year as usual. —R.

[The Voluntary Architectural Examinations will take place at the Institute, as arranged, in May next, and will be advertised in due time. The advertisements did not appear earlier than this last year.—C.L.E.]

[731.]—NEW SYSTEM OF GAS LIGHTING IN PARIS.—Could you inform me where I could obtain full particulars of the light mentioned in your last edition as far surpassing gas in Paris?—J. SUDBURY, jun., January 23.

[We gave some additional information on this subject in our last number. It appears that the proposed method of illumination may be termed new when applied upon a scale so vast as that suggested, but viewed simply as a means of producing a brilliant light, it is familiar to every chemist. The gas is produced by the union of oxygen and hydrogen, though the process is not identical with the well-known oxy-hydrogen light. The projectors of the scheme intend employing the oxygen in the proportion of about a fourth of the coal gas, so as to increase the intensity of the illuminating power nearly eight times. It may be stated, however, that the economy of the project is rather doubted, and some further information on the subject is wanted.]

REPLIES.

[717.]—RED PINE GIRDER.—The breaking weight of a red pine girder, 14in. square and 14ft. bearing, is 784 cwt. on the centre, as stated by "Devonport." It is also correct to say that the same girder, sawn down the middle and bolted together with an iron plate between 14in. × ¾in., will have its breaking weight less than the above. The reason is, that the breaking of the iron plate takes place at a degree of deflection only one-twentieth of that which occurs when a plate of wood of similar dimensions is broken. The value of W, for the iron plate of the above girder, is 175 cwt. on the centre, and the deflection would amount to ·586in. W, for the wood flitches, is 784 cwt. on the centre, and is reached with a deflection of 1·724 in.; nearly three times greater than that of the iron. It is clear, therefore, that the compound girder will have its iron plate broken before the entire strength of the wood has been exercised. It is true, that by judicious bolting, the greater stiffness of the iron will be partially employed to increase that quality in the wood; but, nevertheless, the proportion of wood to iron and its disposition in the above girder is such, that the iron plate will surely fail with a less load than 784 cwt. On some other occasion I may, perhaps, be permitted to show what are the proportions to be observed between wood and iron in the formation of a flitch girder, so as to obtain an increase of strength by the use of the iron plate. Mr. Hurst's formula should be used with caution. It gives the value of W too high, in my opinion, for a flitch girder.—PURLIN.

[717.]—Mr. E. W. Tarn gives a good formulæ for flitch girders, subject to this condition, that the relative thickness of the wood and iron be such that the full resistance of both shall be brought into play. The resistance to deflection of wrought iron is twenty times greater than of fir, having the same length, breadth, and depth. Consequently, to get the full value of both materials in combination, the iron should be one-twentieth the thickness of the wood, or an ¼in. boiler plate should be bolted between two fir cheeks, each 5in. thick.

W = limit of safety in lbs. for the iron plate.
b, *d*, and *l* the breadth, depth, and length, in inches.
W¹, *b*¹, *d*, *l* the same for the fir beam.

$$W = 21000 \frac{b\,d^2}{l}$$

$$W^1 = 1400 \frac{b^1 d^2}{l}$$

Let S = W + W¹ = strength of composite beam.
$b^1 = 20\,b$.
t = full thickness = $b + b^1$.
Then

$$S = 2333 \frac{t\,b^2}{l}.$$

These formulæ will give 352 cwt. as the load which could be borne by "Devonport's" beam without injury to the elasticity. Without the iron plate, the limit of safety would be reached at 204 cwt. These weights would represent the permanent load distributed over the whole beam.

Hurst's formula for the flitch girder seems to be a safe one, for in an experiment at Woolwich, in 1860, it is recorded that two deals 9in. × 3in., with a ¾in. flitch bolted between them, broke with a pressure on the centre of 18·079lbs. The bearing was 17ft. Hurst's formula would make the breaking weight 16·009lbs.—X.

There is a very useful paper on "Iron Girders," in the BUILDING NEWS, of Jan. 22, 1858, worth "Devonport's" attention.

[719.]—COMPOSITION ORNAMENTS FOR PICTURE-FRAMES, AND ORNAMENTAL MOULDINGS.—In reply to "D. G. M.," I give two receipts for the above. 1. Boil 7lbs. of best glue in three and a-half pints of water, melt 3lbs. of white resin in three pints of raw linseed oil; when these are well boiled put them into a large vessel and simmer for half-an-hour, stirring well; now pour in a large quantity of whitening, sifted fine, mix to the consistence of dough, and it is ready for use. 2. Dissolve 1lb. of glue in a gallon of water, boil in another kettle 2lbs. of resin, one gill of Venice turpentine, and one pint of linseed oil; mix all together, and boil till all the water evaporates, then add whitening till the mass attains the consistence of putty. This composition will be hard when cold, but on being warmed may be moulded to any required shape, and may be fastened either to plain surface or mouldings, by means of glue.

[720.]—LINSEED OIL AND TURPENTINE.—Good turpentine, when exposed to the air, always lessens in bulk by evaporation, but gains in weight by absorption of oxygen, which makes it more binding in its proportions. This peculiarity none of the mineral oils possess; on the contrary, the mineral is so completely volatile, that upon exposure the spirit flies off, leaving the oil without anything to assist it to harden.—W. R. T.

[722.]—IRON MINIUM PAINT.—This paint is manufactured by A. de Cartier, at Anderghem, near Brussels. It is a pure oxide of iron, mixed with about one-fourth its weight of silicious clay. It is now extensively used in this and other countries for painting the ironwork of ships, gas holders, &c. A writer in "Gwilt's Encyclopædia," says it is solid, durable, and cheap. It preserves iron from oxidation, and hardens wood. It is a dark brown in colour, but mixes easily with other colours, such as black, yellow, and green. To test its purity, it is said to be sufficient to dilute it with a small quantity of water and spread it on paper, when, if pure, the edges of the paper will preserve the special tint of the iron minium.

WAGES MOVEMENT.

The operative slaters of Glasgow have taken advantage of the pressure of work, consequent on the late storm, to strike for a rise of wages. The masters have resisted the demand, on the ground, we understand, of its being a breach of a distinct agreement, arrived at some time ago, that no change should take place in the rates without three months' notice.

The Employers' Association at Bradford (Yorkshire) have given the members of the Building Lodge the usual six months' notice to expunge the following rule out of the existing local code of rules:—Sub-contracting, &c.—5. All sub-contracting, piece-work, and artificial light to be discontinued; and no worked stone from quarries or lower paid localities (except flags and landings worked on one or both sides) to be allowed. Ornamental carving, turned balusters, and small columns, may be contracted for, but all roughing for carving and turning to be done by masons' day work.

According to the Society's decision, the Birmingham Lodge of Stonemasons have given their employers the usual notice of six months that they intend to return to the local code of rules granted them by the Society, to come into operation last May, but when under negotiations with their employers a very different code was agreed to. Since giving the existing notice, the Master Builders' Association have forwarded the Birmingham Lodge a counter notice of six months that they intend to abide by their recently adopted code. The result of such notices between both parties can only be solved at the expiration of the appointed time—about the beginning of next May.

The Leeds Lodge have also received six months' notice from the Master Builders' Association of that town that they intend to commence paying their workmen by the hour on July 1, 1868.

STAINED GLASS.

A two-light stained glass window, by Mr. A. J. Mingaye, has been placed in the Roman Catholic Church of Our Lady, Kentish-town. The subjects are the "Raising of Lazarus" and the "Healing of the Son of the Widow of Nairn."

A memorial window to the late incumbent has been placed in Tweedmouth Church by his daughters. It is a circle, containing a centre circle and quadrants. In the centre is the "Lamb," and in the quadrants representations of the "Four Evangelists." Mr. Wailes, of Newcastle, is the artist.

A stained glass window has been erected to the memory of Mr. Samuel Clapham, in St. Stephen's Church, Kirkstall, by Messrs. O'Connor, of Berners-street. It is in three large medallions, and the subjects are "The Expulsion from Paradise," "Moses with the Tables of the Law," and "Jesus Delivering the Sermon on the Mount."

A stained glass window has been erected in St. Michael's Church, Coventry, by Messrs. Heaton, Butler, and Bayne, in memory of the late Mr. Thomas Sharp, author of "The Coventry Mysteries." The subjects represented are "The Good Samaritan," "The Faithful Servant," "The Publican and the Pharisee," and "Giving up the Talents."

Three stained windows by Messrs. A and W. F. O'Connor, of London, have been placed in St. Mark's Church, Dewsbury. The subjects are, in the east window, the "Resurrection" and "Ascension," with the "Blessed Virgin and the Apostles" placed in the side-lights; in the west window "The Crucifixion;" and in the north aisle window, which is of three lights, "Our Lord Blessing Little Children."

LEGAL INTELLIGENCE.

POLLUTION OF WATER.—When a well is supplied with water, which percolates through the earth, and does not flow through any defined channel, although the owner of the well is not entitled to the water until it actually enters his well, the occupier of adjoining property will be restrained from using a cesspool therein, in such a manner as to pollute the water coming through his property and supplying the well. This was the holding of the Master of the Rolls in a recent suit for an injunction to restrain the use of a cesspool upon the defendant's premises (near Norwich), in such a manner as to pollute a well belonging to the plaintiff—the case of Womersley *v* Church.

ACTION AGAINST IMPROVEMENT COMMISSIONERS FOR INJURING PROPERTY BY SEWER CONSTRUCTION.—The Earl of Derby *v*. The Bury Improvement Commissioners.—This was an action by the Earl of Derby against the defendants for injury to his reversion to certain lands by cutting a trench and constructing and maintaining a sewer therein, and also by diverting into such sewer a brook which flowed through the said lands. The case came on for trial before Mr. Justice Mellor and a special jury, at the Manchester Spring Assizes, last year, when, by consent, a verdict was found for the plaintiff, with £5,000 damages and 40s. costs, subject to the opinion of this court, upon a special case to be stated by Mr. Baylis, the court to have power to draw inferences of facts and to reduce the damages. The defendants wished to get rid of a nuisance caused by the pollution of a certain brook, and could not do so without constructing a new sewer. Instead of selecting a course by the bed of the stream or the highway, they resolved to take a diagonal and shorter route through enclosed land belonging to the Earl of Derby, called Huntley Feld, which had been let on lease, and without giving notice to the owner they entered upon the land and constructed the sewer in question. On the part of the defendants it was contended that, with the object of abating nuisances and carrying out a comprehensive system of drainage for the general benefit of the whole locality, the Legislature had conferred upon them the power to act in the way they had done, while, on the other hand, it was agreed that their powers were confined to the local act, which did not permit them to construct sewers through private lands without due notice, and that, if that act was not sufficient for their purpose, they should apply to Parliament for additional powers, and not fall back upon the general act. Upon the conclusion of the arguments the court took time to consider their judgment.

ACTION FOR DAMAGES.—On Wednesday the case of Polleyn *v*. Hill and another was tried in the Court of Exchequer. The plaintiff, a journeyman carpenter, brought this action against the defendants, his former employers, for serious bodily injuries alleged to have been sustained through their negligent construction of a floor-cloth manufactory at Deptford, which was blown down by a severe gale which prevailed on July 15 last. Mr. Willis was counsel for plaintiff, and Mr. Serjeant Parry counsel for defendants. The defendants were contractors for the main portion of the building, and at the time of the occurrence some other contractors were engaged in enclosing the sides with corrugated iron. When the structure fell the plaintiff was on the ground floor, and he received an injury which brought on fits, and was likely to be of a permanent nature. The defence was that the building was properly constructed, and in accordance with plans and specimens, as well as under the superintendence of the district surveyor, and the fall of it was to be attributed to the removal of certain struts by the other contractors, or to the effects of the gale itself. Mr. Baron Bramwell, in summing up, said the defendants would not be liable if the plaintiff knew of the dangerous state of the building, and did not take proper precautions for his own safety. The jury, after being locked up for a short time, found a verdict for the plaintiff—damages £350.

DISPUTED CLAIM FOR REPAIRS.—Gregory Perkins and another *v*. Charles Crowdell—This was a claim before the Leicester County Court for £4 6s. 6d., for repairs done to some houses. In July last defendant instructed plaintiffs, who are builders, to make some repairs to some property in Bedford-street. They executed the work, and on presenting the account defendant made no objection to it, but upon being pressed for payment he disputed the amount. Defendant said the amount charged was excessive, and he had had the repairs valued, and they were only estimated at £2.—His Honour adjourned the case to allow defendant an opportunity to produce evidence as to the value of the repairs.

CONVICTION UNDER THE SMOKE NUISANCE ACT.—Mr. Thomas Humphries, the extensive wood merchant, of Jacob-street, Dockhead, Bermondsey, was summoned before Mr. Burcham, on Friday last, at the Southwark Police Court, under the Smoke Nuisance Act, by order of the Home Secretary, for not having his furnaces so constructed as to consume the smoke. Mr. William Sandison, C.E., the Government inspecting engineer, said that, according to instructions he received on the 14th of November last, he visited the defendant's premises, and found a six-horse engine at work at the saw-mills cutting firewood. Dense volumes of black smoke were

emitted from the shaft, and on examining the furnace he found the air-box screwed down, so that whatever may have been done to consume the smoke, it was rendered quite useless. They were burning small coal and refuse, which sent forth such dense smoke as to be a great nuisance to the neighbourhood. Witness saw the manager, and on his promising to comply with the Act of Parliament, fourteen days and ten days were allowed to have the furnace properly constructed, but nothing had been done. The manager said that they had employed a bricklayer to look to the furnaces, and they thought it was all right. He was willing to do anything Mr. Sandison suggested. The Magistrate told him that Mr. Sandison had suggested a proper alteration a long time ago, and as he had neglected that, he must pay a fine of 40s. and costs.

MEETINGS FOR THE WEEK.

SAT.—Associated Arts Institute, "On the Relation of Art to Ethnology," by R. H. S. Smith, M.A., F.S.A.

MON.—Society of Arts, Cantor Lectures, "Preservation, Preparation, and Culinary Treatment of Foods." by Dr. Letheby, M.A.

Society of Engineers.—"On the Surveys of Proposed Lines for a Ship Canal, between the Atlantic and Pacific Oceans. Paper by Dr. Cullen.

Royal Institute of British Architects.—"On the Peculiarities of Domestic Architecture in America." by Gervase Wheeler.

TUES.—Institute of Civil Engineers. "Floods in the Nerbudda Valley, with remarks on Monsoon Floods in India Generally" by Mr. A. C. Howden Assoc. Inst. C.E. at 8; also Discussion upon Fresh Water Floods of Rivers

WED.—Geological Society at 8.

Our Office Table.

Mr. H. H. Vale, of Liverpool, was elected a "fellow" of the Royal Institute of Architects, at its last meeting, and not an "associate," as mentioned by our reporter last week.

The Committee of the Burlington Fine Arts Club have issued a programme of an exhibition of works of art in bronzes, terra cottas, majolica wares, illustrated MSS., decorative books, goldsmiths' work, &c, intended to be held at their rooms during the coming session.

The following nominations as Associates of the Royal Academy have been made:—P. C. Hardwick, E. Welby Pugin, W. Burges, Thomas Wyatt, and Charles Barry. There are two vacancies, and the ballot will take place on this day.

The principal tradesmen of Chester and the neighbourhood connected with the building trade, have formed a district association in connection with the General Builders' Association. The principles of the association are the promotion of the trade interests of each district by the introduction and settlement of the best trade rules, rate of wages, and trade prices; by taking common, instead of individual, action on all general questions; by cultivating mutual good feeling and fellowship; and by the various associations working in connection with one another. Mr. T. Hughes, of Aldford, has been appointed chairman, a vice chairman, and a committee of ten members (two for each of the following branch trades, viz., masons, bricklayers, joiners, plumbers, and painters), were also elected. It has been decided to establish a register of non-unionist workmen, for the benefit of such workmen and for employers.

Mr. G. Dobie, painter, of George-street, Edinburgh, has set a good example in the matter of technical education. With the view of encouraging art studies among journeymen house-painters, he offered a number of prizes, amounting in all to £52 10s., for the best designs of drawing-room and dining-room wall decorations. The competition was open to the whole of Scotland, and thirty-six competitors entered. The designs sent in are now on view at Mr. Dobie's saloon, and they are said to be, on the whole, very creditable pieces of work, several of them, indeed, displaying artistic skill of a high class.

The bill for permission to lay down tramways through certain metropolitan streets passed standing orders on Wednesday unopposed. This bill failed to pass during two previous sessions. This time the memorials against the promoters have been withdrawn, and certain technical difficulties previously existing removed.

An architectural competition, open to all nations, is announced by the Peruvian Government. The subject is a design for a monument to commemorate the victory obtained on May 2, 1866, over the Spanish squadron. It is required that the drawings be sent to the Peruvian Legation in Paris, 66, Rue de Ponthieu, on or before February 15. We may add that the particulars of the competition lie on the library table at the Institute of Architects, in Conduit-street, for the inspection of members.

The committee of the Metropolitan Board of Works have appointed Mr. Palmer to the office of superintendent-foreman of the western division of the fire-brigade. Mr. Palmer was engineer attached to the chief station in Watling-street, and he has succeeded Mr. Tiveotdale, who has proceeded to Birmingham to take the command of the Corporation Fire-Brigade of that town. In esteem for Mr. Tiveotdale's long service, Captain Shaw, the chief of the Metropolitan Fire-Brigade, has presented him with an elegant inkstand, in the form of a manual fire-engine, bearing a silver tablet, with an appropriate inscription.

The members of the Huddersfield Archæological Association held their annual conversazione last week. Mr. T. Brooke, the president of the society, occupied the chair. The report was read, and it showed that the society had made considerable progress during the year. Papers were also read which had been contributed by the Rev. Canon Raines, of York, on "Topographical Materials for Askrigg Wapentake;" by Mr. C. Monkman, Malton, on "Flint Implements and Weapons;" and by Mr. Albert Way, on "An Enamelled Relic of the Roman Period, found at Slack." The Rev. G. L. Mellor gave an interesting description of some of the rubbings from monumental brasses.

Among other interesting relics recently discovered at Pompeii are three handsome bronze bedsteads, which are said to be the most elegant yet found there.

The Historic Society of Lancashire and Cheshire have decided, on the suggestion of Mr. Forrester, one of its members, to establish a biographical section in connection with the society. In bringing the matter before a meeting of the society held last week, Mr. Forrester remarked that he thought it desirable that they should have a record of the lives of those members who had risen to positions of note. He cited as an example the late Mr. Elmes, the architect of St. George's Hall, and the Collegiate Institution, Liverpool, whose brief though brilliant career he considered would make a remarkably interesting paper. The proposition was warmly entertained by the meeting, and Mr. Kilspin was invited to write a paper on Mr. Elmes and his works. That gentleman, we understand, has consented to do so.

We have to announce the death of Baudirector Fischer, honorary and corresponding member of the Royal Institute of British Architects, at Carlsruhe. A short biographical notice of the deceased gentleman will appear in the next sessional paper of the Institute of Architects.

Mr. Beresford-Hope, at the request of the Committee for the Conservation of Ancient Monuments and Remains, has given notice that he will call the attention of the House of Commons, after the recess, to the condition of buildings possessing historical or archæological interest in the custody of Public Departments, and make a motion on the subject. As it is his desire to present as full and important a case as he can to the House, he would be grateful to any one who would aid him with information bearing on this matter. He requests that letters may be addressed to him at 1, Connaught-place, Hyde Park, W.

The Rev. Mr. Kell writes to put the public on their guard against purchasing spurious antiquities. They are represented to be pilgrims' badges, or signaculæ, used by pilgrims between the twelfth and thirteenth centuries when visiting different shrines, and are in the form of a short dagger, signet ring, brooch, spur, amphora, or relic box, to be suspended on a garment. They are manufactured wholesale in Birmingham.

We understand that Mr. Marsh Nelson, the architect, is engaged in inquiring into the cause of the fire at Her Majesty's Theatre, and that his report will shortly be published in an official form.

The tender of Mr. Samuel Campbell, Liverpool, has been accepted for road-making, drainage, and other works of that class, at Sefton Park, in that town. The amount is £72,345.

As a proof of the violence of the hurricane which swept over Edinburgh the other day, the papers there state that on the following morning between sixty and seventy tons of lime, fragments of chimney-pots, slates, and tiles, were collected from the streets.

The "Nottingham Daily Guardian" gives a report of an interesting paper read by Mr. Wm. Stevenson, of Nottingham, on "Trees and their Religious Associations," before the Nottingham Naturalists' Society.

The contract for building the new hotel for the London and North-Western Railway Company, at Lime-street Station, Liverpool, has just been let to Messrs. Haigh and Co., of Liverpool, for about £72,000.

At the meeting of the Archæological Association on Wednesday week, Mr. Cuming in the chair, Mr. H. Kettel exhibited a very fine flint implement which had been picked up in the Weald of Sussex. He also exhibited a very fine club, eleven inches in length, made of clay slate, found near St. Isabel, in South America, in a district where clay slate does not occur. It was precisely similar to a weapon of half the size found some years since in the North of Ireland. Mr. E. Roberts remarked that the good similarity of implements found in all parts of the world seemed to show that in the earliest times a much freer communication existed than we were disposed to believe. Mr. T. Sherratt exhibited a highly interesting gold ring, found in an ancient tomb in the State of New York. Mr. George Wright exhibited a marble head, found at Alexandria, which he supposed to be a head of Marcus Aurelius Antoninus, the philosopher. Mr. Adams was of opinion that the head, though of Roman work, was of some Egyptian or Eastern chief, an opinion which was not shared by many present. Mr. Cuming exhibited a head in marble, which he had identified as that of Magnia Urbica, one of the wives of Marcus Aurelius Charinus. Mr. F. A. Waite exhibited an interesting brass tobacco box, engraved, the property of Mr. Cullinan, in whose family it had been preserved for more than a century. It was of the period of William III., and was said to have been engraved by one of his troopers.

Trade News.

TENDERS.

COVENTRY.—For factory for Messrs. J. and J. Cash. Quantities by Mr. W. Harris, Birmingham. Mr. S. Taylor, architect:—

Wilson	£1,800
Woof	1,700
Lovatt	1,614
Dutton	1,546
Barnsley	1,528
Briggs	1,510
Makepeace	1,498
Worwood	1,488
Hardwick	1,470
Frith	1,466
Nelson	1,450
Hallam and Co.	1,450
Marriott	1,447
Jones	1,445
Jeffery and Pritchard	1,428
Hardy	1,369
Moffatt	1,325
Chandler (accepted)	1,267

DERBY.—For new foundry and offices, at Derby. Mr. G. H. Sheffield, architect:—

Greasley	£1,495
Gadsby	1,486
Stoddard	1,470
Bradbury	1,461
Thompson	1,400
Dusatoy	1,329

ISLEWORTH.—For residence for Mr. A. H. Johnson. Mr. C. Jones, architect. Quantities furnished by Messrs. Richardson and Waghorn:—

Hiscock	£3,250
Mitchell	3,021
Nye	2,897
Killby	2,867
Gibson, Brothers	2,797
Waters	2,785
Adamson and Sons	2,666

LIVERPOOL.—For the lodges, bridges, fountains, colonnades, and other architectural works in Stanley Park (exclusive of boundary railings), for the Corporation of Liverpool. Mr. E. R. Robson, architect:—

Parker and Sons	£24,460
Wells	18,700
Lee	18,250
Hughes	18 239
Burroughes and Son	16,993
Tomkinson	15,700
Jones and Son	15,538
Urmson	15,415
Haigh and Co	15,412
Mullin	15,263
Campbell (accepted)	13,456

ST. PANCRAS DISPENSARY.—In our tender of this work, last week, it was erroneously stated that Messrs. Goulty and Gibbons were the architects. We are now informed that Mr. Edward L. Robins is the architect. We are informed that Mr. B. C. Nightingale's tender was not accepted, through having no signature when opened.

ST. MARYLEBONE.—For extension and alterations to St. Marylebone Public Baths and Washhouses. Mr. C. Eales, architect :—

General Works.	
Hawkins	£5,401 12 9
Scrivener and White	3,416 0 0
Saunders	3,100 0 0
Perkins	3,029 0 0
Godden and Webb	2,985 0 0
Sawyer	2,929 0 0
Manley and Rogers	2,876 0 0
Ebbs and Son	2,846 0 0
Foale	2,300 0 0
Engineering.	
Hayward, Brothers	£615
St. Pancras Ironworks	414
Jennings	248

STRAND.—For sundry alterations to houses in the Strand and Adam street, for Mr. Attenborough. Mr. Arthur Allom, architect. Quantities by Mr. T. Begg :—

Rigby	£1,590
Brass	1,497
Howard	1,430
Mansfield	1,420
Macey	1,379
Newman and Mann	1,135

STRATFORD.—For the erection of a townhall and public offices at Stratford, E., for the West Ham Local Board. Messrs. Lewis Angell and John Giles (Giles and Biren), joint architects. Quantities supplied by Mr. D. W. Young :—

Jollard	£14,785
Charlton	12,345
Rivett	12,333
Nightingale	12,057
Higgs	11,895
Keeble	11,800
Sawyer	11,800
Hill and Keddell	11,753
Howard	11,679
Foster	11,365
Hedges	11,358
Adamson and Sons	11,300
Nixon and Son	11,247
Aviss and Son	11,230
Newman and Mann	11,185
Mann	11,145
Mansfield, Price, and Co.	11,100
Piper and Wheeler	10,994
Myers and Son	10,969
Perry and Co.	10,955
Henshaw	10,895
Webb and Sons	10,683
Enoor (accepted)	10,239
Mundy and Hutchinson	8,600

ST. LEONARDS-ON-SEA.—For St. Leonards British Schools, St. Leonards-on-Sea.—Mr. Benjamin Tree, hon. sec :—

Lower and Burgess, Seaford	£3,114
A. and J. Batstone, St. Leonards	2,679
G. Geary, Hastings	2,645
H. Hughes, St. Leonards	2,543
C. Batstone, St. Leonards	2,464
D. Parks, Hastings	2,464
Nightingale, Lambeth	2,456
G. E. Jones, Hastings	2,450
J. Howell, Hastings	2,424
J. Page, St. Leonards	2,396
J. Jones, St. Leonards	2,395
W. Rodda, St. Leonards	2,361
J. Wood, St. Leonards	2,349
N. F. Sadler, St. Leonards	2,244
A. Vidler, Hastings (accepted)	2,224

WESTMINSTER.—For building new house and shop, 28, Brewer-street, Westminster, for Mr. Apted. Quantities not supplied :—

Nightingale	£808
Sapwell	770

WOODSTOCK-STREET.—For building house, No. 9, Woodstock-street, for Mr. Machu. Messrs. Parriss and Co., architects :—

Winterton	£1,339
Sawyer	1,230
Nightingale	1,226
Wilcocks	1,190
Palmer	1,167
Enoor	1,138
Sharpenton and Cole	1,130
Shofield	1,110
Crabb and Vaughan	1,008
Faulkner and Lee	1,089
West	1,053
Wilson	1,049
Snoden	1,045
Rodgers and Richards	970
Perkins	927
Smith and Simmons	735

PROPERTY SALES.

JAN. 21.

AT THE MART.—By Messrs. Debenham, Tewson, and Farmer.—Copyhold two cottages, known as Ivy and Mount Cottages, Mount-pleasant, Crouch-end, Hornsey, let at £52 10s. per annum—sold for £1,120.

By Mr. Thos. Fisher.—Freehold ground rents, amounting to £274 18s. per annum, secured upon 59 houses, situate in Herne-hill, Waoless and Wigmore-roads, Coldharbour-lane, Brixton—£5,465.

By Messrs. Candy and Luckin.—Leasehold six houses, Nos. 4 to 9, Finsbury-park-terrace, Seven Sisters-road, Holloway, annual value £50 each, term 96 years from 1866, at £6 each per annum—£2,845.

Freehold ground rent of £20 per annum, secured on four houses, situate in Brooksby-walk, Homerton—£430.

By Messrs. Hards, Vaughan, and Leifchild.—Leasehold residence, No. 1, Belmont-villas, Lewisham, let at £61 per annum, term 61 years from 1846, at £7 per annum—£660.

Leasehold three houses, Nos. 48 to 50, Manor-road, Rotherhithe-road, estimated to produce £89 14s. per annum, term 61 years from 1863, at £15 per annum—£410.

Leasehold two residences, Nos. 1 and 2, Western-road, Bromley hill, Kent, annual value £47 each, term 95½ years from 1865, at £5 each per annum—£680.

JAN. 22.

AT THE MART.—By Messrs. Norton, Trist, Watney, and Co.—Freehold estate, known as Cookham Firm, in the parishes of East Grinstead and Horsted Keynes, Sussex, comprising a farmhouse, with homestead, buildings, and 79a. 3r. 6p. of arable, pasture, and wood lands—£2,050.

Freehold residence, known as Pitt Place, with grounds, gardens, farm homesteads, and 53 acres of arable and pasture land, situate in the parish of Mottestone, Isle of Wight—£2,420.

Freehold 27a. 3r. 39p. of arable, pasture, and wood land, in the parish of Brixton, Isle of Wight—£950.

Freehold 2a. 2r. 1p. of meadow land, situate as above—£165.

An undivided moiety of and in the farm and lands known as Stronds or Hawkeshill, otherwise Axcells, in the parish of Mottestone, Isle of Wight, comprising four fields, with building and garden, containing 13a. 1r. 8p.—£340.

Freehold residence, known as Carisbrooke Cottage, Carisbrooke, Isle of Wight, let at £14 per annum—£310.

Rectorial tithe rent charge of £101 15s. 9d. arising from 356a. 1r. 38p. in the parish of Shalfleet, Isle of Wight—£1,820.

Leasehold two houses, with stabling, bakery, &c., known as Buckingham cottages, Westminster, let on lease until Lady-day, 1874, at £14 per annum, and underlet at rentals amounting to £107 4s. per annum, term 40 years from 1855, free from ground rent—£660.

By Mr. George Wilson.—Freehold house, No. 69, Peel-street, Silver street, Kensington, annual value £40—£340.

Freehold two plots of building land in New-road, Hammersmith—£165.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

David Gaved and William Henry Rackett, Penge, builders, February 5, at 1—Frederick William Harcum, Albert-street, Kennington-park-road, engineer, February 17, at 11—George Hayward, Hawkhurst, plumber, February 4, at 1—Richard William Jennings, Liverpool-street, City, gasfitter, February 4, at 1—Charles Turland, Barnet, builder, February 17, at 1—William Flood, Southampton-street, Pentonville, builder, February 19, at 11—Frederick Hersee, Old Kent road, builder, February 13, at 11—William Luxford, Myrtle-street, Dalston, builder, February 13, at 1—William Rowden, Portobello-road, Notting-hill, painter, February 19, at 11—John Springbett, Peckham, builder, February 13, at 1.

TO SURRENDER IN THE COUNTRY.

John Abbott, Newton Heath, joiner, February 4, at 11—John Ashforth, Doncaster, painter, February 5, at 12—George Broughton, Leeds, plasterer, February 3, at 12—Joshua Fitchett, Manchester, plumber, February 11, at 9.30—George Simpson, Stamford, painter, February 3, at 11—John Benjamin Stone, Brighton, painter and paperhanger, February 10, at 11—Charles Warren, Torquay, builder, February 6, at 11—George Hamil, Haddenham, engineer, February 6, at 11—Thomas Hesketh, Manchester, joiner, February 7, at 12—William Henry Hulbert, Cirencester, plumber, February 7, at 12—William Vaile, Birmingham, builder, February 12, at 12.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

February 13, J. Farrar, St. Helen's, builder—February 17, W. Jones, Liverpool and Wootton, builder—February 13, J. and C. J. Mackay, Liverpool, timber merchants—February 11, T. Gower, Newtown, Salop, stonemason—February 15, J. Hunter, Spilsby, builder—February 5, J. B. Rees, Swansea, builder—February 19, E. Clarke, Judd-street, Euston-road, plumber—February 19, M. Doody, Mortimer-market, Tottenham-court-road, dealer in building materials—February 20, H. Etheridge, Maisemore, builder—February 10, F. Strong, Derby, plumber and glazier—February 14, A. Clarke, Hinton St. George, carpenter—February 19, W. Powell, Leicester, plumber—March 3, D. Harding, Willingdon, Sussex, builder.

PARTNERSHIPS DISSOLVED.

W. and A. Pycock, Leeds, slate merchants—Bates and Co., Sedgley, fire-brick manufacturers.

DECLARATIONS OF DIVIDENDS.

S. Berrisford, Stockport, engineer, div. 12s. 9d. on new proofs, and a fourth div. of 4s. 9d.—W. Wrennall, Leyland, Preston, builder, div. 2s. 1¾d.

DIVIDEND.

February 6, W. S. Parfitt, J. Barnard, and A. Harvey, Devizes, engineers.

The New Class Directory.

Now being Compiled, and Shortly to be Published, in One Volume Super-Royal 8vo, Handsomely Bound in Cloth,

Price to Subscribers, £1 1s.; to Non-Subscribers, £1 10s.,

THE

ARCHITECT'S, ENGINEER'S,

AND

BUILDING-TRADES' DIRECTORY

FOR 1868:

A BUSINESS BOOK OF REFERENCE FOR THE

Various Industries connected with the Arts of Construction

THROUGHOUT

EIGHT HUNDRED CITIES, TOWNS, AND PRINCIPAL PLACES IN ENGLAND, SCOTLAND, AND WALES;

COMPRISING

A CONCISE SKETCH OF THE PROFESSIONAL CAREER OF ALL THE LEADING PERSONS ENGAGED IN ARCHITECTURE AND ENGINEERING.

CLASS LITERATURE being now a recognized necessity and a prominent fact of the age, little apology is required in presenting the Prospectus of a Work intended to supply an admitted want, viz., a well edited Business Directory for the especial use of the various and important Professions and Trades identified with the Arts of Construction in this country. In the Weekly Press, Architecture and Engineering are ably represented by the "Builder," the "Building News," the "Engineer," "Engineering," &c.; but, unlike the Clerical, Legal, and Medical Professions, each of which has at least one Annual Record of its Members, the Architects and Engineers of England,—though unenrolled and not certificated—possess no one general List of their Members or record of their professional achievements. This single fact seems to indicate how greatly such a Work as the present is required, and proves the immense value of one which, while seeking to remedy so great a deficiency, proposes also to furnish a complete and useful Trade Directory.

The "ARCHITECT'S, ENGINEER'S, AND BUILDING TRADES' DIRECTORY," therefore, in addition to the usual Directory matter, will seek to give,—in a form at once very brief but quite intelligible,—the salient facts in the professional history of every Architect and Engineer throughout England, Scotland, and Wales.

Such a compilation can only be successfully carried out by the cordial concurrence of those for whose use it is intended. So far as the Publishers are concerned, their name, it is hoped and believed, has been favourably known to the Architects and Civil Engineers of the United Kingdom for the past five-and-twenty years. All that experience, care, and a conscientious endeavour to produce a really good work, can accomplish, will be done on their part. They only ask such information and help as must, to insure accuracy, be obtained in each case from the fountain-head: in return, they undertake to furnish to Subscribers, for the price of 21s., a Work which shall not only be invaluable to all concerned as a mere useful Directory, but shall become a literary monument of modern triumphs in the domains of Art and Science as applied to Construction.

The Publishers cannot believe that, such being their aim, the Architects and Engineers of the present day—unenrolled and almost unrecorded as they are without some such Register—will fail to perceive the professional value, or to co-operate in the production, of a Work having regard to the promotion of their own importance and *status*; while to the Man of Business and the Tradesman the "Architect's, Engineer's, and Building-Trades' Directory,—as all experience goes to prove,—will be an invaluable Book of Reference.

IMPORTANT.—Architects, Engineers, Surveyors, Contractors, Builders; Granite, Stone, Slate, Brick, and Timber Merchants; Metal Founders; and, in short, all persons connected with Architecture and Engineering in England, Scotland, and Wales, are particularly requested to communicate immediately with the Publishers, should they not be shortly applied to for the necessary information to appear in this Work.

A PROMPT RETURN of the FORMS already sent out is earnestly requested.

ADVERTISERS who seek to address Architects, Engineers, Contractors Builders; Granite, Stone, Slate, Brick, and Timber Merchants; Metal Founders; and, in short, all the Industries connected with Architecture and Engineering in England, Scotland, and Wales, should immediately SEND their TRADE ANNOUNCEMENTS for insertion in the "Architect's, Engineer's and Building Trades' Directory."

*** For Specimen of the Work, Leading Features, Size of Page, Scale for Advertisements, and all other particulars, address Wyman and Sons, 74-75, Great Queen-street, London, W.C.

THE NEW CLASS DIRECTORY.

Now being compiled, and shortly to be published, in One Volume Super royal 8vo, handsomely bound in cloth, price to Subscribers, £1 1s.; to Non-Subscribers, £1 10s. the

ARCHITECTS, ENGINEER'S, and BUILDING TRADES' DIRECTORY for 1868; a Business Book of Reference for the Various Industries connected with the Arts of Construction throughout Eight-Hundred Cities, Towns, and Principal Places in England, Scotland, and Wales, comprising a concise Sketch of the Professional Career of all the Leading Persons engaged in Architecture and Engineering.

IMPORTANT.—Architects, Engineers, Surveyors, Contractors, Builders, and all persons connected with the Arts of Construction, are particularly requested to communicate immediately with the Publishers, should they not be shortly applied to for the necessary information to appear in this Work, for the insertion of which no charge is made. A prompt Return of the Forms already sent out is earnestly requested

*** For Specimen of the Work, Leading Features, Size of Page, Forms for furnishing Names, &c., and all other Particulars, address Wyman and Sons, 74-75, Great Queen-Street, London, W.C.

A PROMPT RETURN of all FORMS sent to the Professions and Trades by the Publishers of the "Architect's, Engineer's, and Building Trades' Directory" is requested, to ensure the early completion of the Work.—Wyman and Sons, 74-75, Great Queen-street, London, W.C.

TO CIVIL ENGINEERS.—The Publishers of the "Architect's, Engineer's, and Building Trades' Directory" earnestly request the PROMPT RETURN of FORMS containing Name, Address, and Particulars relating to Civil Engineers, for insertion (without charge) in their new Class Directory.—Wyman and Sons, 74-75, Great Queen-street, London, W.C.

ARCHITECTS and SURVEYORS are solicited to forward, immediately, NAME, ADDRESS, TITLES, &c., for Insertion, free of charge, in the "Architect's, Engineer's, and Building-Trades' Directory." Suitable Forms will be forwarded on application, where they have not been already received.—Wyman and Sons, 74-75, Great Queen street, London, W.C.

ENGINEERS, IRONFOUNDERS, BRASSFOUNDERS, and all Workers in Metal, are requested to immediately forward NAME and ADDRESS for Gratuitous Insertion in the "Architect's, Engineer's, and Building-Trades' Directory." Suitable Forms will be forwarded on application, where they have not been already received.—Wyman and Sons, 74-75, Great Queen-street, London, W.C.

CLERKS of WORKS are invited to send immediately NAME and ADDRESS, with Name and Address of Employer, for Gratuitous Insertion in the "Architect's, Engineer's, and Building-Trades' Directory.—Wyman and Sons, 74-75, Great Queen-street, London, W.C.

ART WORKMEN connected with Architecture or Engineering should Immediately send NAME, ADDRESS, and OCCUPATION, with Name and Address of Employer, for Gratuitous Insertion in the "Architect's, Engineer's, and Building Trades' Directory."—Wyman and Sons, 74-75, Great Queen-street, London.

OUT-DOOR FOREMEN are invited to sent immediately NAME and ADDRESS of EMPLOYER, for Gratuitous insertion in the "Architect's, Engineer's, and Building Trades' Directory."—Wyman and Sons, 74-75, Great Queen-street, London, W.C.

THE Publishers of the "Architect's, Engineer's, and Building Trades' Directory gratefully acknowledge several important suggestions from correspondents and offers of friendly assistance towards rendering their New Class Directory as complete and valuable as possible to those for whose use it is intended. They will gladly supply every facility to those, who taking an interest in this important work are willing to further its compilation and promote its success.—Wyman and Sons, 74-75, Great Queen-street, London, W.C.

WYMAN & SONS, 74-75, GREAT QUEEN STREET, LONDON, W.C.

THE BUILDING NEWS.

LONDON, FRIDAY, FEBRUARY 7, 1868.

CONTINENTAL JOINERS' WORK.

DURING the past year we have heard of the above class of work being imported into this country, but in such a cursory manner that its introduction has been officially denied in evidence before the Royal Commission on Trades'-Unions. From numerous inquiries we have received from various quarters, we have been induced to investigate the subject, and, in doing so, we have no other object than placing our readers in possession of the full facts and bearings of the question. We find that Frederickstadt and Stockholm, in Sweden, are the two ports from which prepared woodwork is exported. In the former case, we have no evidence of anything further than mouldings and prepared flooring being sent, nor have we received any very flattering notice of their quality; but, in the case of Stockholm, we have to notice a superior class of goods, which embrace nearly the whole field occupied by the carpenters and joiners, and it is the productions of this latter town which we shall specially notice.

The continental joiners' work now being introduced into this country is the produce of the firm of P. J. Ekman, of Stockholm. This gentleman is an architect and practical builder of great experience, and has for many years been engaged in manufacturing joiners' work for the Swedish builders. In 1865, he visited France, Italy, and this country, and from the fact of his works, and many local advantages in labour and timber, being superior to anything witnessed in his travels, he conceived the notion of enlarging his works, and supplying the European markets, as well as the Swedish. On his way home he learnt that his premises had been burnt to the ground, and this misfortune opened out a ready method of enlarging his works. They were speedily rebuilt in a fire-proof manner, the premises embraced by the machine and joiners' shops being all in one room, 180ft. square, the building being entirely of iron, stone, and glass. The steam engine is 100-horse power, and the whole of the machinery is of the best and newest description, a portion of it being English, another portion American, and the remainder of Swedish make. To give an idea of the works, we may note that the yard and ground covers from eight to ten acres, which are situate on the quay side, for the convenience of shipping. The fuel for the steam boilers is nothing but sawdust and refuse from the machinery, the furnaces being constructed on a new plan to consume such material. In connection with this machinery, upwards of one hundred men are employed. They comprise joiners, machine men, and labourers of various grades, their hours of labour being the same as that prevailing throughout Sweden, viz., 67½ hours per week. Their hours are from 6 a.m. to 7.30 p.m., 2 hours being allowed for meals: on Saturdays they close work at 5.30. The average rate of wages is for skilled joiners and machine men, 3s. 6d., circular saw men, 2s. 3d., and labourers, 1s. 4d. Trades'-unions are unknown, and piece work is largely pursued, the men preferring to have what they can earn to being restricted to a given rate of wages.

The wood from which the goods are manufactured is of the best quality, being selected by agents at the saw mills up the country, where the sawn deals are made for exportation. They thus obtain a monopoly in the quality of the wood; and before it can get damaged by rain or shipping, as is the case with our English goods, it is received at the works in Stockholm, cut up and seasoned ready for use. This seasoning is conducted by steam pipes in chambers constructed for the purpose, and is not allowed to pass into the hands of the workmen until it is thoroughly dry. The principal goods manufactured for the English markets are mouldings, architraves, skirtings, door frames and casings, framed grounds, doors of every description, and sashes and frames; and these goods we shall only speak of from actual inspection. The mouldings, skirtings, &c., are remarkably clean and good, and, from the fact of the wood being thoroughly dry before being placed in the machine, they require no cleaning up, but come to hand in bundles from the machine. They comprise a full list of those sections in general use in this country, and, with the exception of a little more work in the skirting and the door frames, and an extra thickness in the plinth boards, they are exactly the same as those in daily use. The sizes and qualities of the doors are very numerous, ranging from 1¼in. to 2in. in thickness, and from the common square-framed four-panel doors to the six-panelled raised moulded outer doors. They are divided into two classes, *i.e.*, deal and batten framing, that is, with 9in. and 7in. framing, and 4½in. or 3½in. stiles and top rails. The various qualities of these doors are too numerous to detail, but at a glance they seem to embrace every conceivable size and make. We notice no marked distinction between these doors and those of the ordinary English make, except that the whole of the panels are jointed up in two or three pieces. This, although a more costly process than we indulge in, is a custom of long standing in Sweden. They maintain that panels in one board will not stand to their work, but if jointed up in two or three strange pieces will always maintain their even shape. The English builders are afraid of these joints separating when in work; but such is not the case, as they are prepared with tongued and grooved joints, and secured by the best fish glue—a quality unknown to our carpenters. This jointing of the panels has been severely tested in London. Water has been laid in the panels for eight days, and a panel is shown that has been fastened upon a strong frame and soaked for some hours in the canal, after which it has been suddenly placed over a steam boiler. This failed to separate the joints, but the panel is split down in what was formerly the solid wood. With this proof, we are bound to admit that the Swedish joiners are right in their treatment of door panels. The morticing, jointing, and fitting of the panels in the framing is remarkably good, and they are as level at the joints after being nearly two years in this country as if they had just left the workshop. The sashes are very similar to the English make; the back linings are solid boards grooved into the linings, and the cills are double sunk. They are imported in detached pieces, and put together in this country. This is done in consequence of the space they would occupy in the steamers. The men employed in this department are paid at the London rate of 8d. per hour, or 6s. per day of 9 hours. In addition to the above goods we noticed a stock of wood fencing and lattice work for gardens. The fencing is beautifully made, and is of a pattern largely used in the neighbourhood of Stockholm. The lattice work is a curiosity, as it is packed in a close form and may be opened out to three times its space. This is owing to the quality of the nails used, and it is remarkable with what ease they may be opened out to cover any required space. Mr. P. J. Ekman's warehouse is 33, Wharf-road, City-road, London, where may be seen the largest stock of doors, mouldings, &c., in the kingdom. We inspected piles of doors of various description, whose aggregate number was between four and five thousand.

A notice of this subject would not be complete without some allusion to the prices. We were shown outside front doors 2in. in thickness, with what they call "deal framing." The whole of the panels on the front side were planted with bold bolection moulds; on the other, or inner side of the door, the lower panels were bead and flush, and the upper panels were moulded in the ordinary way. These doors are sold at 16s. 3d. each, if 6ft. 10in. by 2ft. 10in. in size; or, in other words, at 10d. per foot. Inside doors, 1¼in. thick, deal framing, are sold at 6s. 9d. each, if 6ft. 6in. by 2ft. 6in. in size, or at 5d. per foot; for moulding these doors an extra charge of 1s. per side is made. The list price of mouldings, skirtings, casings, &c., is 20 per cent. below those of this country; and the latticework may be purchased at 2d. per superficial foot when opened to its proper space. One and a-half inch sashes and frames vary from 7d. to 9d. per foot. We were shown a sample sash, 1¼in., lamb's tongue mould, with bracketed stiles, oak sunk cill, segment-headed casement, and outside lining, at 9d. per superficial foot. The arrangements made with the works in Stockholm are such that persons requiring a special quality of goods which may not be kept in stock, can have them made to order and delivered in London in six weeks or two months from receipt of drawings. The postal arrangements and the transport of the goods are somewhat interfered with during the depth of winter; but in summer time a letter will reach its destination in four days. The goods are put on rail at Stockholm and sent to Gottenburg, from whence they are despatched by steamers to London and other ports.

Since the introduction of this class of work, some of the leading London builders have made heavy purchases, some of which have been re-shipped for Egypt and Africa. They have been landed in large quantities in London. Whole blocks of property, such as those erected by the Industrial Dwellings' Company, have been wholly supplied from this source, and references are readily given by the architects under which they have been used. From London they have spread far and wide in the neighbourhood. Those landed at Grimsby, which are in the hands of the timber merchants, have made their way to Manchester, Nottingham, Grantham, and other towns; and it may fairly be said to have speedily become an established branch of our trade throughout the main portions of the country.

POLYCHROMATIC DECORATION.

IT is at all times interesting to observe the changes which are taking place in public taste, and in no instance is this change more remarkable than in the use of colour for decoration. We believe it is to Ludwig of Bavaria and his architect, Leo von Klenze, that we are indebted for the practical application of colour to external walls, although the subject had previously been dealt with in a dilettante sort of way. Little appears, however, to have been done until elaborate experiments were made on the remains of the temple of Minerva at Ægina, resulting in the discovery of a very elaborate system of ornament. The colours were found not to be tints merely, but positive colours of the highest hues, reds, blues, yellows, and even greens being unsparingly used in large masses. Until these experiments had proved that the Greeks were masters of the use of colour, as they were of every other known art, it had been boldly asserted by the dilettanti that the traces of polychromatic decoration which certain temples undoubtedly presented were the fruits of churchwardenship and beadledom. The subject was handled in a contemptuous off-hand manner, not, however, without handsome expressions of pity for the poor Greeks. King Ludwig and Leo von Klenze, to say nothing of M. Hittorf, had different notions. The King had money to spend, and M. von Klenze had no objection to help him to do so. The result is to be seen at Munich. It will surprise those who enlarge on the rapid transmission of thought, and eager grasping of new views, to state the simple fact that, whereas the public buildings of Munich have been externally decorated with gilding and colour for a quarter of a century, there are only two

buildings in London which have been so treated, and those within the last half year. Of one of these the less said the better: the other is the house of Novello, Ewer, and Co., Berners-street, a stuccoed front of the fashion of thirty years ago, when Greek art was paramount. Now, it must be known that the house of Novello, Ewer, and Co. is the abode of the muses, and, if gay decoration is suitable to any house, it is certainly applicable to that under notice. The architecture is not very good, and, although the upper storeys set up to be pure Greek, the ground floor has circular-headed doors. With the architecture, fortunately, we have nothing to do. Messrs. Clayton and Bell found the building as it was, and they have applied the resources of their art to its rehabilitation. The house consists of three storeys above the ground floor; the decoration takes the form of pilasters of small projection, surmounted by an attic storey, and, taken altogether, the field offered for the display of polychromatic decoration is at least limited. Messrs. Clayton and Bell have done as much as could have been expected, and have converted a commonplace building into a bright and cheerful landmark, illustrating the advance of art, and indicating a new turn in the current of the taste of the day. The groundwork of the decoration is for the most part cream colour, varied with a little neutral green and buff; the patterns are in Indian red, and consist of honeysuckle ornament and lines. Over the first-floor windows are medallions on a black ground of well-known composers—Purcell, Mendelssohn, Haydn, Handel, Beethoven, Mozart, Palestrina, and Gluck. The corona of the cornice to first-floor windows is gilt. Some amount of blue is introduced into the decoration of the windows, and also in the cornice to the attic storey.

This is not successful. The blue, always difficult of treatment, is not pure in tone, and even the presence of a considerable amount of gilding does not remove a certain disagreeable impression. The pilasters are coloured with Indian red for about one third of their height, the remainder being cream colour with flutings in Indian red, and the capitals are gilt. As a specimen of polychromatic decoration applied externally, this building is interesting. It looks bright and clean, and, though in the London atmosphere it cannot be expected to remain long in that condition, it may be washed without detriment to the colours used, which have been selected with especial view to their permanency. Although this is about the first instance in this country of the application of colour to external decoration, we are certain that it will not be the last. There are many indications of the growing taste in bright colours in dress, and in internal decorations of houses and churches, and we may be assured that the façades of our buildings will not be permanently left without a clothing of cheerful colours.

NEW BUILDINGS IN LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

THE recent commercial depression in Liverpool cannot be said to be apparent at present in the aspect of things architectural, as new erections, chiefly either offices or banks, are in progress, or recently completed, on all sides in the neighbourhood of the Exchange, constituting the "business" part of the town. The north and east wings of the New Exchange-buildings are already appearing above the contractor's temporary fence-walls; and are proceeding, under the able and energetic direction of Mr. Parsons, the clerk of the works, at even a faster rate than did the west wing. The east wing is to be hurried on and completed as soon as possible for occupation; and an alteration is to be made from the original design, in the placing of a small circular tower above the rounded corner at the junction of Chapel-street and Exchange-street East, which will give more skyline and relieve the comparative lowness of the building; while the north wing will have a central compartment, with roof rising above the general roof line, forming a marked object opposite to the end of Old Hall-street. The detail is, of course, of the same character with the part already completed; but the old columns which formerly carried the arcading in the principal entrance from Chapel-street on to the quadrangle have been cleaned up and made use of again in nearly the same situation, but with bases and pedestals added; and a great deal of the old material (a capital hard, close-grained sandstone) is being worked up in the lower part, up to the top of the surbase. The Hollington stone used in the upper part of the new work will not last as well as this old stone has done; it is a pleasing material, but so soft as it comes from the quarry that great care is necessary in working and placing it, and a good deal of it will have to be dressed down again *in situ*. The fireproof floors over basement are being formed of small iron beams about four and a half inches deep and two feet apart, on the flanges of which rest the ends of a series of hollow tiles of triangular section, the angle upwards and the face downwards, and serrated to form a key for plaster or cement, while above the tiles comes a layer, about ten inches deep, of concrete. The arcade, with its rusticated pilasters and polished granite shafts contrasting with them, has a piquant effect enough; and when the work is finished the quadrangle, though from the want of repose and continuity of horizontal line it can never look grand, will no doubt present a very rich and picturesque whole.

On the opposite side of Exchange-street East the talents of Mr. Sumner are displayed in the front of the Exchange Court-buildings, which, though presenting features borrowed from very different styles, giving us reminiscences of Elizabethan as well as of Greek and Italian detail, is most happily and artistically blended into one whole, and presents more of originality combined with grace than can be found in most buildings in Liverpool, having something of that picturesque incongruity which characterizes the Elizabethan buildings, with much more of refinement and effect in the details. The rustication of the alternate quoins in the piers of the ground storey is effected by the carving of foliage on the face of the stone, instead of the ordinary devices of channelling, &c., but the carving would have been better for being less relieved and less naturalistic—it rather seems to adhere to the stone than to form an integral part of it, as in such case it should do. The walls of staircase and passages are lined with white glazed tiles, with a small border and centre ornament in light blue on the white ground, which has a cheerful and pleasing effect. There is a sad descent in style from this building to the one next it, by Mr. Cunningham, which has a great deal of showy but commonplace ornament lavished on it, with little or no artistic taste or judgment, cupids, with wreaths and festoons, disporting themselves over the windows, interspersed with griffin's heads (also with the inevitable festoons depending from them), and vases and scrolls of much elaboration, the whole having rather the effect of the regulation cement front of a gin-palace translated into stone. Mellor's-buildings adjoining, by Messrs. Picton, Bradley, and Chambers, have a good deal of merit, especially in the treatment of the deep set ground-floor windows, with arched heads, carried by shafts of grey polished granite, standing well away from the window frames, and giving a satisfactory effect of depth and shadow, though the roll moulding of the archivolt is decidedly heavy and clumsy-looking. The upper storeys are less satisfactory, the fenestration (especially in the second floor) being somewhat tame and commonplace in style; and the ornament is not happily treated, having no special relation to the general expression of the design, nor very effective in itself; the flat incised pattern in the first-floor string is very weak, and the isolated floral ornaments, repeated at regular intervals along the frieze, like so many small cabbages squeezed flat and stuck on, are simply excrescences.

Turning down Chapel-street, we find that opposite the west wing of the Exchange Mr. Boult has been revelling in a "new style," exhibited in an erection yclept Dod's-buildings. Originality, however, does not mean merely novelty, but novelty combined with beauty and truth of expression, which are scarcely to be found in this case. The lower part of the elevation consists of three large segmental stilted arches, carried on columns of polished red granite, divided into three lengths by bands of stone; the bases resting on granite pedestals, which are so limited in size that the lower member of the circular base would project some three or four inches beyond the face of the pedestal were it not sliced off, like a half-eaten cake, to bring it flush with the pedestal. Whether this be a mason's blunder, or a part of the new style, we know not; either way it looks sufficiently ridiculous. The large arches above-named go up through two storeys, and are filled in between with a conglomeration of wood-framing and glass, one window over another. Above these are the second and third storey windows, the former quasi-Italian, with round arches on light shafts and spandrils filled in with carving; the latter, quasi-Gothic, with pointed arches and coloured voussoirs. Both these storeys are pleasing *per se*, but look as if they were cut out of two different buildings, so diverse in style and expression are they. Altogether, Mr. Boult's new style will scarcely be that of the future, let us hope.

Turning into Rumford-street (along the west front of the Exchange), we find in the long façade entitled Peter's-buildings an illustration of one of the most valuable qualities of architectural design in which the Exchange-building itself is notably deficient, namely, breadth and continuity of line. The whole of the windows on each floor are of one design, and arranged in a long unbroken series; and the whole of the features of the building are in keeping with each other, and in subordination to the total effect. Unfortunately, this great (and very rare) merit is balanced by two serious defects of detail—the exceeding thinness of the piers and wall space, as compared with the openings, and the hard, thin, and wiry character of most of the mouldings and string-courses, which gives a starved appearance to the building that is much to be regretted, as there can be no doubt that, had the details been carried out in a manner more worthy of the general design, the elevation would have been one of the most dignified and pleasing among the new office buildings. But this attempt at effect by arranging an elevation in large and continuous masses should only be made when the construction and details can be carried out with a certain solidity and massiveness of style, otherwise the effect, instead of being imposing, is only tame and flat. The lover of the sublime in architecture, however, will be amply rewarded for previous disappointment if he turn down Water-street and contemplate the erection called Oriel-buildings, which the genius of Mr. Peter Ellis has called into existence. This is a kind of greenhouse architecture run mad; consisting of a series of vertical bays running completely from top to bottom of the building, divided from each other by long thin shafts, rising from the plinth without any bases, said shafts being flanked by a very large coarse "nail-head" ornament. Between these artistically designed piers are a series of bay windows with iron frames, one above the other, projecting beyond the main line of the wall, and suggesting the idea that they are trying to escape from the building. The whole thing is composed of these vertical strips of design (?) placed side by side, each bay crowned with a finial looking like a big, badly cut decanter-stopper. The style, in short, might be described as "lunar Gothic;" and no one who has not seen it would believe, we think, that

such a thing could, in the present day, be erected in cold blood by any person calling himself a member of the architectural profession.

GOSSIP FROM GLASGOW.

(FROM OUR CORRESPONDENT.)

SINCE I last wrote the event of chief interest in our architectural world has been the publication of "Gowodean."* This is a dramatic pastoral in the Scottish language, from the pen of Mr. Salmon, one of our leading architects. Mr. Salmon is—if I except perhaps his late partner, Mr. Black—the father of the profession; he is also an ex-baillie (i.e., alderman), and an elder (churchwarden) of the Free Kirk; moreover, he has his son in partnership with him, and, consequently, he may be expected to be a gentleman of "mellow'd head and judgment ripe," and not likely to venture before the public with rhyme without reason. Our leading literary newspaper, "The Glasgow Citizen," says, in reviewing this drama, "It is a century-and-a-half since Allan Ramsay's great pastoral, 'The Gentle Shepherd,' appeared, and 'Gowodean,' so far as we know, is the first attempt since then to represent the Arcadian simplicity of Scottish rural life in dramatic form, and in the ancient national language. . . . . Mr. Salmon has woven a plot of considerable ingenuity and interest, and adorned it with many gems of poetical imagery. Here and there, too, in the simple texture of his verse, he has interwoven passages so replete with beauty and wisdom as to make the reader involuntarily pause and read again." Of course, any notice of a literary work of this kind would be incongruous in THE BUILDING NEWS, were it not that the author is an architect. By the way, Mr. Salmon is not the only architect who has been also a dramatist: the names of Vanbrugh, Beazley, and Mathews will readily occur to your readers.

At the usual monthly meeting of the Water Commissioners, held on the 6th of January, the Memorial Sub-Committee recommended that a drinking fountain be erected to commemorate the projection and completion of the Loch Katrine Waterworks; that the inscription upon it should be similar to that on the floor of the tunnel at Loch Katrine; that the centre of Saint Enoch-square would be a suitable place for its erection; and that it should be somewhat similar to the fountain erected at Holyrood Palace, Edinburgh. Than the site none could be more suitable—immediately neighbouring where the great thoroughfares of Argyle and Buchanan-streets meet at right angles, and in the most direct line between the principal railway termini and the harbour, but the style of architecture recommended is very open to question. There may be a sort of sentimental sympathy between the barbarous old Scottish Gothic and Holyrood Palace, but there can be no congruency of any kind between it and the circumstances of Saint Enoch square. For some years past Saint Enoch-square has been one of the most progressive parts of the city, and is some (indefinite) day to be the site of the grand central terminus of the Union Railway, so, independently of its present surroundings (which are Classical, of a sort), it is wholly alien in genius to any expression of the Dark Ages.

In the interval since my last communication there have been two meetings of the Glasgow Architectural Society. At the former the expected discussion on the president's opinion of the City Improvement Act and the president himself were alike conspicuous by their absence, and at the latter Mr. Stevenson discoursed "On the recent competition in Liverpool for labourers' dwellings, and the influence of the municipal building regulations as shown in the various plans." Taking a leaf out of Mrs. Glass's Cookery Book—"First catch your hare"—the pet "working-man" to exercise his household suffrage must first have a house; and hence, perhaps, *inter alia*, this extraordinary activity here, there, everywhere, and elsewhere in the matter of "Better houses for the working classes," and "Every man his own landlord." After reviewing the Liverpool competition, Mr. Stevenson concluded—"The result of building acts is uniformity of planning the same proportion of street and house and court, multiplied for miles, over a whole town, producing not only the dreariest monotony of architecture (that is a matter which people now-a-days don't seem to think of much importance), but, what is worse, an absolutely equal temperature over the whole space, no draughts or currents, or movements of the atmosphere. What they should aim at is irregularity—wide streets and squares, and narrow streets opening into them. The wide space becoming heated by the sun's action in warm weather, artificial draughts would be created from the cooler narrow streets on the principle of the trade winds. Such a town would in many respects be pleasant to live in; it would have greater variety, and every street not being given up to cart traffic there would be open spaces for the children, who invariably abound in such localities, to play, without the risk of being run over." In the discussion which followed, Mr. Thomson, on the principle of locking the stable after the steed's stolen, made some observations on the (Glasgow) City Improvement Scheme, expressing an opinion that by a different arrangement of the block of houses, a population as large as that at present existing on the space to be improved could be accommodated on the same ground with perfect sanitary arrangements. Some remarks were likewise made on the extravagance of pulling down whole streets in order to straighten them—"a mistake almost as great in an architectural point of view as it is in a financial." Mr. Thomson is to resume the question at the meeting to be held on the 29th proximo, so the subject, if not the houses, has a prospect of being well ventilated. As Mr. Stevenson is a pupil of one of the most eminent London Gothic architects (and hence probably his argument for "irregularity"—a plea that he has more strongly urged upon former occasions), and Mr. Thomson is by both pencil and pen our chief apologist for Greek, it is likely that "betwixt them both they'll lick the platter clean." It is, however, surely matter for regret that the Glasgow Architectural Society did not oblige the civic powers, the public, and the profession, with its views of a City Improvement Scheme *before*, instead of after, that scheme had become part and parcel of the statute-book.

But the "Battle of the Styles" is about to be fought upon other ground than the "irregularity" or the "dreary monotony" of street architecture. We are to have a competition strictly limited—limited not as to "natural selection," but as to style, "Greek or Gothic" having been discovered by some United Presbyterians to be the only style worthy of such a building as a church These United Presbyterians, in their zeal for Popish Gothic or Pagan Greek, are either ignorant or forgetful of the great ecclesiastical works that have been designed in the flexile and beautiful Italian in both our own country and abroad, or they are else the slaves of some æsthetic prejudice. If I recollect aright, a particular style was defined in the competition for the Houses of Parliament, and we see the result. Architects certainly ought to know much better than church committees the style most suitable for a building, and they might with safety be left to the exercise of their own judgment. As a straw shows how the wind blows, the specification of "Greek" indicates that the great Gothic dynasty is at length upon the wane.

Professor Gairdner, the Officer of Health, has addressed a letter to the Lord-Provost, intimating that, in consequence of a difference of opinion between him and the Sanitary Committee, he will have to resign the direction of the medical staff. Since his appointment, Dr. Gairdner has been exceedingly active and zealous in everything tending to increase the health-rate of the city.

The Seventh Annual Exhibition of Painting, Sculpture, &c., of the Glasgow Institute of the Fine Arts was opened on the evening of Monday, the 3rd inst., by a grand *conversazione*. Judging from a hurried visit to the "private view," this year's exhibition will be superior to almost all its predecessors. The exhibition of the portraits of eminent persons associated with Glasgow is expected to be opened in about a fortnight, and will possess high local interest. David Hamilton, the eminent Glasgow architect—by the way, the taker of the third prize in the competition for the Houses of Parliament—will be represented by an excellent painting taken when he was in his prime, and a most characteristic bust by John Mossman's father, taken in later life. The two exhibitions are in the same building, the property of the Corporation—the Institute's in the original galleries on the street floor, and the portrait in the new galleries up stairs.

* "Gowodean," a Pastoral, by JAMES SALMON. Edinburgh: Edmonstone and Douglas.

TERRA COTTA, AND ITS EMPLOYMENT AS A LONDON BUILDING MATERIAL.*

IN a report on Class 65 of the Paris Exhibition, treating more especially of terra cotta, I find this passage:—"That history repeats itself is shown by the revival of the use of terra cotta. Four thousand years ago baked, cooked, or burnt earth—terra cotta—was common enough in Egypt, and was the building material of that people. It was used by the Greeks, by the Romans, and by various European countries in the Middle Ages, and now, in the Paris Exhibition, proofs are afforded in all parts of it, that modern Europe is largely reviving the use of terra cotta." Mr. Cole might have claimed even greater antiquity than he does for burnt clay, for it was of this material that the earliest building mentioned in history was constructed. "The people," we are told in the twelfth chapter of Genesis, "found a plain in the land of Shinar and dwelt there, and they said one to another, Go to, let us make bricks, and burn them thoroughly, and they had brick for stone, and slime had they for mortar. And they said, Go to, let us build us a city, and a tower whose top may reach unto heaven, and let us make us a name, lest we be scattered abroad upon the face of the whole earth." Sun dried and baked clay was employed by nearly all the great nations of antiquity in their early works. The granaries and storehouses of Egypt, the vast mounds of Nineveh and Babylon, and the aqueducts and other remains of Roman times, testify how widespread was its use. Nor was burnt earth used merely as a material for building. Strange to say, this clay, in itself so friable, when properly treated by man's intelligence becomes the most durable of substances, and has been the means of treasuring up the documentary records of a monarchy of which other direct records have wholly perished—the means of handing down to us the art of a people whose very history is lost, and whose race and era are disputed questions. You will be aware that I speak of the clay cylinders of Nineveh, and the fictile vases of Etruria. You who have examined those cylinders, whereon are marvellously impressed, in characters still sharp and clear as when they were first produced, the names and acts of rulers who flourished 3,000 years ago, will need no further proof of the durability of terra cotta, while our own museums and those of other continental nations are full of wonderful evidences, in their collections of Etruscan vases and tazzæ, not only of the beautiful art, the refined taste, and the poetic imagination of that mysterious race, but, also, of the judgment with which they selected the most durable material in which to hand them down to future ages.

As to the building material of the ancients, this seems remarkable—that before they learnt the use of the native products, the stone and marble that so universally abounded, a sort of natural instinct seems to have led them to temper the clay, to knead and mould it, to bake it in the sun, and burn it in the fire—in fact, to manufacture a material, rather than to use a natural one. In nearly all the instances I have been alluding to the substance is spoken of as brick, and I am now naturally led to investigate the difference, if any, which exists between clay burnt into brick and clay burnt into terra cotta. I find it extremely difficult to define this difference, and still more to give any general rule which should enable the unskilled observer to distinguish at once between brick and terra cotta. The same clay undergoes the same general preparatory processes, and partly from more care and attention in the shaping and firing, and partly from the use only of the purest portions, the resulting material is known in the one case as terra cotta, while, in the other, it is simply brick. The truth is that the finer grained firebricks, and the hardest and best qualities of red bricks, such as those made from the Hampshire clays, are terra cotta; and many of the second rate and softer varieties of terra cotta, more especially those of a light red colour, are unworthy of the name, as it is at present understood, and are even, if anything, inferior to brick. While speaking of the hardness of terra cotta, I may call your attention to a test of this quality which should be

* Read before the Architectural Association, 9, Conduit-street, on Friday, January 31, 1868, by Gilbert R. Redgrave.

made binding on manufacturers, namely, that it should resist the scratching of a pin, and if of a superior quality, that of an iron point.

About the commencement of the present century Messrs. Croggan had an establishment in Lambeth Marsh, for the sale and manufacture of artificial stone ornaments. The composition of this stone was a secret; but I find in the "Somerset House Gazette" for the year 1824, an interesting account of a visit to Messrs. Coade's, late Croggan's, gallery of artificial stone ornaments. The writer speaks of the many articles for which this material may be employed, and enumerated, among the objects exhibited, "ornamental figures, enriched vases, baptismal fonts, garden fountains, and capitals of pillars of the different orders, of all sizes." He tells us that "there was considerable shyness about the composition of this artificial stone, but chiefly as to the proportions of the ingredients. Some articles are first formed roughly to give them the external shape in a mould, they are then polished by the chisel while in a soft state, which they endeavour to preserve by wrapping the block carefully in wet cloths. In some cases particular enrichments prepared in matrices are added, and in others the whole is nearly the work of the hand." He seems to have some notion of the material, for he goes on to say:—"The process seemed very much like what I had observed in Mr. Chantry's workshops, in modelling the designs in clay, for the future marble to embody." He tells us that "after the figure is completed in all its parts, it is cut into several pieces for the conveniency of introducing it into the oven, and is afterwards put together, firmly cemented, and iron rods introduced into the arms or other parts that may require to be strengthened." He concludes his remarks on this part of his subject by stating the durability of the material to be fully equal to the ordinary kinds of stone, and expresses an opinion that, when the power of the composition to resist the influence of the weather is fully ascertained by a longer experience, it will encourage the more general use of it and give employment to a higher class of workmen. This account of Coade's terra cotta naturally led me to endeavour to find out some buildings of this period in London whose enrichments have been executed in this material, and I was fortunate enough to find in Pugin and Britton's "Public Buildings of London," in the description of St. Pancras Church, that "the capitals to the columns and antæ, and all the external ornaments, enriched mouldings, &c., are of terra cotta. Imitations of Greek tiles in terra cotta are ranged along the coping of the side walls, as well as round the circular part of the east end;" and in the part describing the colossal statues of females guarding the entrance to the catacombs, there is the following footnote:—"The above figures are of terra cotta—they were formed in pieces, and cemented together round pillars of cast iron, which, in reality, support the entablatures." We also learn from this work that Messrs C. and H. Rossi were paid £4,300 for terra cotta ornamental work. St. Pancras Church was roofed in in 1820, and finally completed in 1822. Although I have not yet been able to ascertain much on the subject of Messrs. C. and H. Rossi, or of their manufactory, we have in the above facts some most interesting data with regard to terra cotta work in London.

The whole of the exterior of St. Pancras Church is faced with Portland stone ashlar work, and is a splendid monument of the superior durability of terra cotta work as contrasted with one of our best English building stones, as all can compare the sharpness and freshness of the terra cotta with the worn, bleached, and disintegrated stone. The blocks used are some of them of large size, and are remarkably truly and squarely filed. The blocks forming the caryatides do not appear to have contracted very evenly in baking, and have been chiselled considerably in places to conceal the joints. This is always a great mistake, as the outer surface or coat of terra cotta gets slightly vitrified in the kiln, and the face thus formed resists the action of the weather far better than an artificial face formed with the chisel. Indeed terra cotta always exhibits the parts where the exterior has been cut or rubbed away in a very short time after the building is completed, in the shape of ugly weather stains at the joints. A singular method of employing terra cotta may be observed in those portions of St. Pancras Church where blocks larger than could be burnt in one piece were necessary, namely, the enrichedportions in terra cotta which have either been inserted in short lengths into recesses and grooved in, or merely stuck with cement against large blocks of the Portland stone. This may be very clearly seen in the three beautiful west doors, the architraves of which are enriched with terra cotta rosettes stuck against the stone, while the enriched cyma and the bead are let into grooves in the stone in about one foot lengths, the stones themselves being from 3ft. to 4ft. in length. Although one is inclined at once to condemn this treatment of terra cotta, it has many points in its favour. As the exposed mouldings of the Portland stone are the parts most liable to decay, by making them of a very indestructible material the general durability of the building is increased.

Another building in which terra cotta has been employed is All Souls' Church, Langham-place Here, I am told by Mr. Blanchard, the successor of Messrs. Coade, the capitals of the columns were supplied by that firm in the year 1822. The church is ashlared with Bath stone, and an opportunity is thus afforded to us of perceiving how favourably terra cotta compares with this material. All Souls was designed by Mr. Nash.

The quaint basso-relievo inserted in the Haymarket front of the recently destroyed Italian opera was modelled by Mr. Bubb, the sculptor, in a substance called, in Messrs. Pugin and Britton's work, lithargolite, or artificial stone. This grand name, I imagine, is merely a disguise, and may with safety be translated into terra cotta. As the lithargolite, in common with the Roman cement stucco fell a prey to the painter, we cannot glean from it any information with regard to its durability. This front was added to the old opera house by Mr. Nash, in the year 1820, and the lithargolite is dated 1821. There are, beyond a doubt, many buildings in London of this date, the enrichments of which are executed in terra cotta. In my efforts to discover other buildings besides those I have enumerated, I have had the following difficulties to contend with. About 1820, which may be called the period of the revival of the use of terra cotta, there were many patent materials before the public intended to replace stone in the numerous edifices which were springing up and supplanting the brick buildings, which prior to that time were the fashion. It was then that Parker's, now known (Heaven knows why) as Roman, cement stucco was hailed for its power of converting a brick into a sham stone front, and Austin, Mulglave, Ranger, Bagshaw, Seely, and other makers, all called their ware artificial stone: thus when this term occurs in the description of the ornamental work of a building, it is impossible to state, without actual examination, whether terra cotta or only moulded stucco was employed.

In the struggle with the various cements which ensued, terra cotta was, I believe, worsted. This was probably owing to the fact that, as the early manufacturers aimed at assimilating their productions to stone, a much more perfect resemblance could be obtained with stucco than with burnt clay, and, in fact, the quality which we now so much admire in terra cotta—its colour, was that which, in the earlier stages of its London career proved its ruin and hastened its downfall. I believe that it is not entirely superfluous to warn modern manufacturers of the fallacy and danger of attempting to produce terra cotta in direct imitation of stone. Terra cotta work must not pretend to be masonry, and the whiteness and consequent softness of some terra cotta is mainly attributable to a false notion that its resemblance to stone is an advantage.

In the brief account I have just given you of terra cotta, I have collected strong evidences of the power it possesses of resisting the influences of our London atmosphere. Had I seen fit to have brought under your notice examples from all parts of the country, I might have pointed out instances of far more lengthened exposure to our climate than I have been able to find in the metropolis. I cannot forbear, however, from making mention of two or three ancient specimens of interest to the architect. Sutton Place, near Guildford, is a most remarkable example of a Tudor building of the most elaborate kind, the ornamental parts of which are red and white terra cotta. It was built in the year 1530, by Richard Weston, brewer to King Henry VIII., and some blocks and specimens of the material, wonderfully well preserved, have been presented by the present owner to the South Kensington Museum. A still older example, and within easy access of Londoners, is to be found in the roundels and coat of arms inserted into the walls of Hampton Court Palace. This terra cotta, which is very hard, and of a light red colour, has, whether made in this country or not, been fairly exposed to our climate for 350 years, as it is certainly of a date coeval with the building. It has been attributed to Maestro Georgione, who was in this country at that time. The modelling of the heads of the Cæsars is bold and vigorous, and, although this work has been exposed to the wind and rain for ten generations, and though the brick, the stone, and almost every material used in the construction of the Palace, is more or less worn or decayed, this substance was, till within the last twenty-five years, untouched by the restorer. It is now painted, and some parts that were damaged have been added in cement. But I have already said more than enough to prove how eminently terra cotta is worthy of extensive use in London.

Terra cotta, considered with reference to the architect. The quality which causes the architect more trouble, perhaps, than any other, with regard to terra cotta, is its shrinkage. Clay, as you are doubtless aware, shrinks in drying and burning very considerably, varying according to its colour, its composition, and its position in the kiln, in firing from $\frac{1}{4}$in. to $1\frac{1}{2}$in. in the foot. In order to arrive at a fair conclusion as to the scale of shrinkage, and at the same time to obtain a genuine sample of the material, I have found it advisible to prepare a plaster-cast of some simple ornament, and to deliver copies of the same to the manufacturers who are invited to supply the terra cotta, requesting them to make a mould from the cast, and impressing upon them, firstly, the necessity of using an exact sample of the clay which would be used for the whole of the work; secondly, desiring them to do nothing in the way of touching up the clay squeeze more than is absolutely necessary for the process of moulding; and, lastly, requiring them to burn the clay blocks in various parts of the kiln, with the customary heat. These trial pieces, together with the plaster-cast, must then be returned to the architect. I have before me some such samples or trial pieces received from manufacturers, and you will perceive at once, on comparing the original with the reproductions in terra cotta, how necessary it is to induce the workman to refrain from what is called the touching up or finishing process, as much of the spirit and freshness of the design is thereby sacrificed to a little sharpness and smoothness of surface.

Having before him these samples, the architect can make his choice, and select the one of which the colour, hardness, and truth, or squareness of form, is superior. He may then proceed, by a simple rule of three sum, to ascertain the scale of shrinkage. As the average lengths of the terra cotta blocks are to that of the plaster model, so is 1ft. to x, or, as I have worked it out for one set of these trial pieces, so is 1ft. to $13\frac{3}{8}$in. This $1\frac{3}{8}$in. therefore represents the amount the clay from which this sample was burnt loses in drying and firing, and this is the shrinkage which it will be necessary to provide for in every subsequent model and full size drawing for the clay goods of the manufacturers who supplied it, and who happen to be Messrs Gibbs and Canning, of Tamworth. You observed, doubtless, that I said "average length," when speaking of the terra cotta—it is very important to obtain such an average, as some terra cottas vary considerably according to their position in the kiln, &c. In this particular specimen the difference is very slight, and is a sign of its goodness. Having set down on paper, or, better, on a slip of wood, this same $13\frac{3}{8}$in. I should proceed to divide it into twelve parts for inches, and then into quarters and eighths, and I have then the scale for Messrs. Gibbs and Canning's white terra cotta. Messrs. Blanchard's scale would have been 13in. to the foot for white terra cotta, and $12\frac{3}{8}$in. only for red. But these differences are unimportant, so long as the results obtained are uniform for large dimensions, and here I must admit that in very few cases can this ascertained shrinkage scale be relied upon for very accurate results. It is therefore necessary to make provision in façades of great length for closers or filling-in blocks which admit either of being cut to suit the dimension or inserted into each course at a later period of the work.

I will now assume that the detail drawings of the terra cotta work for a large building had to be prepared. On the subject of scale I can only impress upon you the well-known fact that (until we introduce the decimal system into England) there is no scale more intelligible and satisfactory for details than $\frac{1}{8}$in. to 1in, or $1\frac{1}{2}$in. to the foot, and to this scale the small size terra cotta drawings, showing the relative position of the blocks, should be prepared. Here I come to a very important question, namely, the size of the blocks. To arrive at a reliable conclusion with regard to

this point we must consult not only the convenience of the producer and the builder, but also the architectural effect of few or many joints. It is of course impossible to produce terra cotta blocks beyond a certain limit of size, on account of the difficulty of manipulation in the manufacture, and of the danger of imperfection in the firing, and I think that this limit should be placed at a contents of four cubic feet or thereabouts. I have seen blocks beyond this size, but when they exceed these proportions they are apt to remind one of the sheet of paper five miles long, or of the marvellous iron joists and railway metals, which are inevitable features at exhibitions, manufacturers' *chef d'œuvres* of no earthly practical use.*

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

PECULIARITIES OF AMERICAN DOMESTIC ARCHITECTURE.

AT the ordinary general meeting of the above Institute, held on Monday evening last, Mr. Charles Barry in the chair, it was announced that a committee of the Council had been appointed to consider the effect of the New Metropolitan Building Act and its bearing upon the profession and practice of architects generally. Professor David T. Ansted, M.A., was by acclamation elected an honorary member of the Institute; and Mr. Oswald C. Arthur, of Plymouth, was elected as a fellow. The Chairman announced that Mr. H. Austin Layard, M.P., had been recommended by the Council as the recipient of the Royal Gold Medal of the Institute for the present year.

Mr. GERVASE WHEELER read a very interesting communication "On the Peculiarities of Domestic Architecture in America." The writer commenced by remarking that the public buildings of America—those of New York being chiefly commented upon—many of them large and substantial, do not differ from similar structures, such as may be found at home. The churches depart only in plan and internal arrangements from their European types, their architecture having no especial marks of novelty. Trinity Church, in New York, was mentioned as a fair example of a large building of the Perpendicular period. The other costly churches of New York, Boston, and Philadelphia are many of them well designed, admirably built, and especially comfortable in their fittings and appointments, but they have no national difference to stamp them as American; it was, therefore, in the domestic architecture of the country must be sought the germ of a national style, if such a flower was ever to bloom on transatlantic soil. Domestic life in America was described as differing from ours mainly in this, that it is social on a much larger scale, and that it is far more comprehensive in its domestic machinery. The result practically is that the houses are all very much larger, the rooms of great size, and the appliances and arrangements to save labour to servants are most important features in the plan. It was important to remember that very much of the effect of American architecture is due to the wonderful brightness of the atmosphere and the enormous distance to the zenith. The flashing reflections of the bright tin roofs (not so common now as they were fifteen years ago) strike on first sight with peculiar distinctness, and such is the dryness of the atmosphere, even by the seaside, that these roofs are durable in a remarkable degree. Slates, however, are very largely used now, and the French *mansard* roofs are becoming quite numerous. The sudden and enormous falls of snow, and the accumulation of ice, caused one of the most marked features of an American town residence—viz., its very large and far-extending cornice, which, in fact, is only an enriched gutter supported upon brackets, and having the water led therefrom into down pipes of very large size. Thus, the first striking feature of an American house is the cornice; and an immense variety of embellishment may be seen therein. Next to the cornice the entrance doorway is a feature demanding notice. This is invariably high and wide, and elaborately embellished, in all cases consisting of wide outer doors and an inner vestibule of marble or inlaid tile flooring, and approached by a high and wide flight of steps. Beneath all the houses are very spacious and lofty sub-cellars in which is the furnace or hot water or steam apparatus, which warms and ventilates the whole building. Next above this, a little sunk below the level of the pavement, is the basement floor, comprising the usual living room of the family in front; in rear of it very large and well-arranged china closets, pantries, and serving-room; and, behind, the kitchen, continuous with which is the laundry, supplied with fixed washing-troughs of most admirable construction; the whole spacious and well lighted. The size of the houses is invariably regulated by the fixed frontage of a "lot," which means twenty-five feet by not less than one hundred feet in depth. Buildings are, therefore, on one, two, or more lots, as the case may be; and sometimes there are two upon one lot, with a frontage of only twelve and a-half feet each, where land is too costly for a full front. The style chosen for these structures is as whimsical as individual taste can select or contrive. Severe purity of any kind must not be looked for. Overcrowded ornament and incongruous elaborated details are to be seen; yet there is nothing really offensive to the eye in most of the costly residences of New York. At present, the great want is of a real meaning in the embellishments so lavishly thrown upon the buildings, although conscientious efforts are made by a few native architects to bring about the commencement of a national style by the adoption of natural forms in their designs for architectural decoration. The New Academy of Design in New York is notably an example of this; and in many a princely mansion in the upper part of that city may be traced some evidences of thoughtful care to give an American expression to familiar details. The lavish supply of water to all parts of the house was spoken of as a valuable feature in American houses; consequently, the plumbing is a very important item in a contractor's estimate, often forming quite one-fifth of the whole. In a climate so severe in winter precaution has to be taken to guard against frost; so the pipes are laid in such a manner as to let the water run back when the pressure is removed, and by opening a safety cock at the junction and closing the union attached thereto every night, all pipes are emptied. The pipes are never buried in the walls or partitions, but are all displayed in sight, and being handsomely mounted on polished or painted strips, and with furniture almost invariably plated, they are rather ornamental adjuncts to a house than a disfigurement. The supply of hot water to bath-rooms, &c., is almost invariably on the low pressure system, and supplied from boilers of cylindrical form, and of capacity of from thirty to one hundred gallons. The fuel generally employed is anthracite coal, which not only gives a greater degree of heat, but keeps the flues much freer from fouling than the kind in ordinary use here. All the large towns abound with mansions that exhibit every luxury and extravagance that wealth can supply, and which, in point of size and lavish architectural decoration, can compete with the grandest modern residences of London or Paris; but the house of moderate size, such as every dweller in a town needs, is the example which the author had before him in these brief remarks on American domestic architecture.

The building materials in use in America differ in the several States. All are well supplied, and the city of New York is in reality one vast stone quarry, so that in the upper part the excavations for foundations have to be blasted out, and the stone removed is frequently well adapted for building purposes. The immediate neighbourhood abounds with marble, and the opposite State of New Jersey has abundance of beautiful fine-grained freestone of an excellent quality. A stone is also met with very like our own Robin Hood, and is in great favour with the Americans. Timber being, of course, in great abundance, the frame of a building is usually of heavy scantling, and the joiners prefer batting thicknesses together to form girders, breastsummers, and lintels to forming them out of the solid. The bricks used are generally of excellent quality. In Philadelphia and Baltimore a red brick is made of great beauty, pressed by machinery, and remarkably true and well formed. The American bricks are smaller than ours, being but 8in. in length, so that the walls differ in thickness from our own in this proportion.

In the country wooden buildings are still very common. The mode of building is to cover a frame with rough boards externally, and then with clap boards, as they are called, which are boards planed by machinery, one end worked down to a feather edge, and laid so as to allow the thick edge to lap well over the other. Another mode is to use upright planks placed against each other, and a batten over the joints. The frame is usually filled in with soft or place bricks, half a brick thick, or sometimes with coarse plaster, and the whole is lathed and plastered internally in the usual way. Paper as a wall hanging is very seldom employed, and owners of houses used to forbid its application by tenants, even at their own expense. A peculiar mode of plaster finish, called hard finish, is commonly adopted, and consists of rendering the last coat in fine plaster and marble dust carefully floated, which dries with a hard and almost polished surface, and gives a perfectly smooth and clean face.

It would be seen by these remarks (the writer continued) that the American town house is almost *sui generis*; it is not French, nor is it English, although possessing features common to both countries. The rural houses of America, however, show a decidedly English parentage, and the sedulous attention to domestic requirements proves how much the traditional home teachings of the mother country have been respected. Twenty years ago architects were not so numerous in America as they are now, and consequently a large proportion of the country houses were built without their aid, although every effort was made to obtain professional advice. Books were consulted by individuals wanting a house to be built; illustrated designs and plans were carefully conned over and altered according to the taste and wants of the intending home founder, and with these to show what the arrangement of the floors were wished to be, the builder generally supplied the rest. Downing's books, and others of a similar character, were in great demand at the period referred to, and had Professor Kerr's "Gentleman's House" been published at that time it would have found in the United States a circulation that would have delighted its author. The larger houses in America built some years ago more closely followed European types, particularly those erected in the Southern States, and there was nothing particular or noteworthy about them, excepting the size of the rooms and the ample provision of verandahs, colonnades, and other shades affording external features. Society in America is in a transitional state, and, as we all know, it takes more than one generation to mature the finished harmonious family house, like that of the English gentleman of wealth and cultivated taste.

In conclusion, Mr. Wheeler remarked that, in one respect, our American friends have something to learn from us: good as their houses generally are the adjuncts thereto are not as carefully provided. The outbuildings are rarely so compactly arranged or so well contrived as may be seen at home. The roofs of these country buildings are rarely so much broken up as with us. The sudden accumulation of snow in the winter makes builders careful to provide even slopes and unchecked lines of descent; hence valleys and dormer windows, and multiplicity of gables, are as much as possible avoided. Towers and observatories are freely used, and are generally large and serving a useful purpose. In some cases the upper room of the tower was sufficiently large for a billiard table, and used for that purpose. In one residence he remembered, after amply providing every species of accommodation, there was sufficient space left in the cellarage for an American bowling alley, and in another for a museum of natural history and geology. He trusted that this brief sketch of recollections of domestic buildings in town and country might serve to show that Americans have made rapid and commendable progress in all that pertains to internal comfort and the conveniences of practical house life. He had purposely said but little upon the artistic expression of their architecture, because, without numerous illustrations, the subject would be unfairly viewed and still preferably, because Americans have scarcely yet reached a positivism in expression sufficient to give their designs individuality. An interesting problem remains for our transatlantic professional brethren to work out; much progress has undoubtedly been made, and he could not close his remarks on this subject without recording his individual belief that it is in her domestic architecture that America may be expected to develope a national style.

In the discussion which followed the paper, in reply to various inquiries, Mr. Wheeler gave some further details as to the system of sewerage, water supply, warming, and ventilating, &c., pursued in America. The cost of construction of an ordinary town house he estimated at from 9d. to 10d. per cubic foot, and that of a country house at from 6d. to 8d., or a little less than that. All buildings erected were subject to the regulations of the "Fire Act," which stood in the place of our

* To be concluded in our next number.

Building Act. Each city and town was divided into fire districts, to each of which inspectors were appointed to see that the provisions of the act were complied with in the new buildings.

Professor DONALDSON, in proposing a vote of thanks to Mr. Wheeler for his communication, expressed a hope that that gentleman would add to its interest and practical value by furnishing one or two plans of American houses to accompany the publication of the paper.

Professor KERR, in seconding the vote of thanks, referred to the characteristics of American society as illustrating the peculiar domestic arrangements of the houses described in the paper, and which, he said, operated with greater force in the Southern States, during the prevalence of slavery, than in the Northern.

The vote of thanks was unanimously accorded to Mr. Wheeler.

GOTHIC FORMS APPLIED TO FURNITURE, ETC.

WE illustrate, this week, a sheet from Mr. Talbert's book on Furniture—the subject having been reduced to suit the pages of the BUILDING NEWS by Messrs. McClure and Company. The illustration is a very good specimen of the suggestive nature of the sketches. Furniture of this character, though possessing many praiseworthy features, is often very poor in tone, and much akin to carpentry work, instead of what is considered cabinet work. The want of richness in the colour, which a late correspondent considered like "putty," arises, no doubt, from an impression that oak is the only wood for this class of work—that it is dishonest to stain, or vulgar to polish; but it would, perhaps, be better to use these means to enrich it than to employ gold or paint, or waiting half a century for a natural deep mellow tint. Though oak is undoubtedly a noble and native material, the kind usually employed is not of British but foreign growth. There are some woods, such as mahogany, rosewood, walnut, maple, satinwood, &c., better adapted for many purposes, both from the closeness of their fibre and colour, for cabinet work. The ignoring of these more delicately grained woods is unfortunately the rule. Then there seems to be also an antipathy to carving. Most of the works we have seen recently executed have not the least pretension to anything of the kind, and though good Gothic wood carving is difficult to obtain, yet it is one that should be grappled with, for it is the most legitimate mode of wood ornamentation, and putting it entirely aside in favour of inlays and paint is a mistake.

ARCHITECTURAL INSTITUTE OF SCOTLAND.

WE have before us the eighteenth report which was presented at the Annual General Meeting of this Institute recently. The document gives a summary of the work of the Institute for the past year. The more interesting portions of the report refer to the prizes offered by the Institute for the encouragement of young apprentices, who it is satisfactory to know continue to manifest much interest in the different competitions. The subjects for competition during the past year were:—

1. For the best geometrical drawing, being an elevation of any existing example of Gothic architecture. To be competed for by apprentices, of not more than three years' standing, of any Scotch architect.

2. For the best perspective line drawing of any existing example of architecture, projected and raised from the plan.

3. For the best original design—subject, a memorial cross.

4. A prize, not exceeding £5 5s., for the best series of not less than five drawings of an ancient example of Scottish architecture, either of the Domestic or Ecclesiastical style, suitable for publication in the Transactions of the Institute, and not previously fully illustrated therein. No competitor appeared for this prize.

The prize for competition No. 1 was gained by Mr. J. L. Campbell, in the office of James W. Smith, Esq., architect, Edinburgh. For prize No. 2 the successful competitor was Mr. James Darling, apprentice to W. M. Gorrie, Esq., architect, Edinburgh. Prize No. 3 was gained by Mr. John Ord, apprentice to David Macgibbon, Esq., architect, Edinburgh.

Mr. David Cousin, architect, offered a prize of £2 2s. for a series of drawings of Magdalen Chapel, Cowgate, for which only one person competed, Mr. Andrew Dewar, in the office of Mr. Paterson, architect, Edinburgh, who received the prize.

The subjects for competition during the current year are as follows:—

1. The best geometrical drawing, being an elevation of any existing example of Italian architecture. To be competed for by apprentices, of not more than three years' standing, of any Scotch architect.

2. The best original design of a wooden principal rafter for a roof having a span of 50ft., with working drawings (scale—an inch to the foot) and details, with specifications. Open to any apprentice.

3. The best original design—subject, an elevation of a range of street houses, with shops on ground-floor—say 100ft. of front. Open to all competitors.

4. For the best perspective line drawing of any existing example of architecture, projected and raised from the plan. Open to any apprentice of any Scotch architect.

MANCHESTER DISTRICT SCHOOLS.

ONE of our illustrations represents the Manchester Warehousemen and Clerks' Orphan Schools now being erected in the suburbs of Manchester. It is constructed to accommodate about one hundred boys and girls, and is so arranged that it can easily be extended at a trifling cost. The dormitory and school-rooms will be well ventilated and lofty. There will be kitchen, scullery, bakery, play-rooms, and other conveniences on the basement floor. The walls are constructed of bricks made on the spot, and are formed with a 2in. cavity in the centre of the wall, the inner and outer brickwork being well tied together with galvanized iron cramps. Darley Dale stone dressings are freely introduced, and the front entrance is approached by a handsome flight of stone steps. We believe the total cost will be under £10,000. Earl Granville laid the foundation stone a short time since. Mr. Ernest Bates, of London and Manchester, is the architect.

METROPOLITAN BOARD OF WORKS.

AT a meeting of this body last Friday, a report was presented from the Works and General Purposes Committee, stating the steps taken in regard to the laying out of Finsbury and Southwark Parks. It was reported that the contracts had been let for the formation of roads and footpaths, entrance lodges, gateways, &c., and the works were in active progress. Plans for laying and planting Southwark Park had been prepared, and they were submitted for the approval of the Board, and plans for the laying out and planting of Finsbury Park were in the course of preparation, and would be submitted for the approval of the Board at the earliest possible period. The Board also considered a memorial from the Commissioners of Sewers for the City of London, which stated that an opportunity was offered by the works of the London, Chatham, and Dover Railway Company to effect an improvement at the western end of Ludgate-hill, opening out northward to Farringdon-street and southward to New Bridge-street. For many years past great inconvenience has resulted from the amount of cross traffic at this spot, and it is believed that the proposed plan, which is estimated to cost £23,512 independently of personal charges, will be a vast improvement. It may be stated that the ground for Southwark Park has been acquired at a cost of £60,000. Its area is sixty-five acres; but, in order to recoup a portion of the sum expended in its formation, belts of land skirting its wider parts will be appropriated to the erection of about 300 houses, of such a class as to command a rent of £50 a year. About fifteen acres of ground will be set apart for this purpose.

ARCHITECTS' FEES.

A CASE of considerable importance to the members of the profession was tried in the High Court, Bombay, during the past month, before Sir Charles Sargent. The suit was instituted by Messrs. Scott, McClelland, and Co., against Cowasjee Jehangeer Readymoney, the Hon. George Foggo, and Narrayen Dinanathjee, members of the committee of the Native Charitable Dispensary. The following is a copy of the bill filed:—

To preliminary sketches for new Dispensary, and to set plans of sections and elevations complete, and to details to large scale, at 2½ per cent. on intended cost of building (Rs. 80,000)	Rs.	2,000
Detailed estimates of same, with detailed specifications and general conditions; and to lithographed bills of quantities furnished to contractors; and to inviting, receiving, and examining tenders and submitting same to Committee (at 2 per cent. on Rs. 80,000)	,,	1,600
Extra sets of drawings for same, to different designs and to rough estimates for same; to various personal attendances on and correspondence with Dr. Vitters; taking instructions &c., on the subject, and to various personal attendances upon and correspondence with Mr. Trubshawe on the subject.....	,,	500
Total	Rs	4,100
By Cash	,,	2,500
Balance.....	Rs.	1,600

The plea of the defendants for non-payment was that the sum claimed was not due, inasmuch as the charges made were each and all excessive. A decree in favour of the plaintiffs for Rs. 1,000, without costs, was given.

LIGHTHOUSES.

IN his new work on "Wonderful Inventions, from the Mariner's Compass to the Electric Telegraph Cable," Mr. Timbs devotes a chapter to lighthouses, giving an account of the method and materials of constructing and lighting these structures. Cast-iron has been extensively used in constructing lighthouses. A small light tower was first erected on Gravesend pier. Next, a lighthouse of cast-iron was built on Morant Point, Jamaica, designed by A. Gordon, in outline resembling that of the Celtic towers of Ireland. It was cast in England, and set up at Jamaica within six months, and at one-third of the cost of a stone lighthouse of equal dimensions: its height is 105ft., and it was erected on the coral rock, by a derrick and crab from the inside, without any external scaffolding. The base is 27ft. of masonry and concrete. The tower shaft consists of tiers of iron plates, each 10ft. high, flanged together with nut and screw bolts, and caulked with iron cement. Ten radiating plates form the floor of the lightroom, secured to the tower upon brackets and finished by an iron railing. Mr. Gordon has also built, on the same principle, at Gibbs Hill, Bermuda, a lighthouse 130ft. high, and another at Point-de-Galle, Ceylon. Lighthouses of iron, cast or wrought, or partly of gun-metal, are cheap, easily erected, strong to resist vibration in hurricanes, and safe from lightning, earthquakes, and fire; their lining and ventilation providing the desired and uniform temperature. Lighthouses have also been constructed upon iron piles, fixed in the sand by mooring screws, and made compact by cast-iron braces; the Maplin and Chaplin Lights, at the mouth of the Thames, and those at Fleetwood and Belfast, are on this principle. Others have been built upon hollow cast-iron columns, as that on the Bishop's Rock, thirty miles from the Land's End, and more exposed to the force of the Atlantic than the famed Eddystone Lighthouse. The six columns are sunk 5ft. into the rock, and tapering upwards, support, at a height of about 100ft. the dwellings of the three light-keepers, with stores of provisions for four months; the whole is surmounted by the lantern, and the access to the dwellings is by a spiral staircase within a central column.

The next meeting of the British Association will commence at Norwich, on Wednesday, the 19th of August. Dr. Hooker, of Kew, the president of the year, will deliver the inaugural address.

PUGIN *VERSUS* BARRY.

MR. GLADSTONE has ventured an opinion on this controversy. A short time since the great statesman, when visiting his constituency, stayed at Scarisbrick Hall, a building which was designed and partly carried out by Augustus Welby Pugin, about the same time as the Houses of Parliament were designed. We have not seen the Hall, but, from reliable accounts, it is one of the finest specimens of modern Gothic in the country. Mr. Pugin, in his reply to Mr. Fergusson, two or three weeks since, said, that one of the foremost statesmen of the day said, in a conversation with him,—"If I have reason for not believing all that you claim for your father regarding the Houses of Parliament, it lies in the fact that the work at Scarisbrick is so much bolder, more effective, and successful than that at Westminster." Since then Mr. Gladstone has written a letter to Mr. Pugin, in which he says, "Endeavouring to recal my words, I think they must have been to this effect:—'That I thought it impossible not to recognize the relationship of the Scarisbrick Tower and the Clock Tower; and that, much as, in common with all the world, I admire the Clock Tower, the Scarisbrick Tower, which I was then viewing, appeared to me to be a still more beautiful and *living* work.'" We hope to give in a week or two an illustration of this tower, and put it by the side of some Gothic churches erected in London from Sir Charles Barry's designs, about the same period. These illustrations will no doubt throw some light on the Pugin *versus* Barry controversy.

SOCIETY OF FEMALE ARTISTS.

THE exhibition of this Society is now on view at the rooms of the Architectural Association in Conduit-street. While fully appreciating the interesting nature of the institution, the high character of the patronage, and the labours of the contributors, we cannot but remark that, as a whole, the exhibition does not place female art in a very favourable light. In point of fact, many of these pictures, and more especially some in oils, should never have been exhibited. It would be invidious to point to examples that we cannot praise, and our readers will prefer to have attention drawn to the meritorious works rather than the others. Foremost we are inclined to place the works of the indefatigable Madame Bodichon. As usual they are sketches in Africa, and she exhibits no less than thirteen, all of interest and bearing the stamp of nature. Miss Warren contributes eight drawings, amongst which Nos. 168 and 174—views in the neighbourhood of Maple-durham—are the best in the exhibition. Lady Dunbar has several vigorous sketches, one of which—a sunrise at Minorca—is remarkable for its wonderful force of colour. The large drawing, "Ghiffa Pass, Algeria," is not so successful as the rest. Miss Mason's "Horseshoe of the Severn" is very pleasing, and very low in price. This extreme lowness of price is a noticeable feature, and we are far from thinking it a matter for congratulation. There is no reason whatever why a lady should not receive as much for her work as a man, provided the work be as good. Rosa Bonheur, if we mistake not, found her account in charging a good price for her paintings. No. 51, a view in Kent, by Mrs. Oliver, is much in the style of J. D. Harding. Miss Freeman Kempson contributes several scenes in Wales and Lakeland. Miss Adelaide Claxton exhibits a remarkable drawing, a ghost scene, with the title, "It would be spoken to;" a lady standing in front of a fire in a large old-fashioned room is apparently being mutely appealed to by a kneeling figure in ancient dress. The story is well told, and there is a weirdness about every detail. Miss Louise Rayner has produced some beautiful interiors of Knole. Interiors are at all times difficult subjects, but Miss Rayner has been most successful. The polish on the floors seems to be somewhat excessive, but, with this exception, there is nothing that can be found fault with, unless it be the very low price at which this lady rates her works. Seven guineas for No. 233, "Fireplace in the spangled bed-room, Knole," is not a fitting price. The same may be said of Miss Eliza Sharpe's beautiful water-colour copy of Maclise's play scene in "Hamlet." Of the oil paintings it is impossible to speak well. There are a few good works on the walls, and a great many that are worse than indifferent. A fancy portrait, No. 348, by Helen Hoppner Coode, is the best. Miss C. F. Williams has a pretty view on the Thames, near Earley, and an old water-mill in Devon, No. 368. Mrs. Olive Newcomen's picture, "Carting," is a very good imitation of Rosa Bonheur. Miss Bowers has truthfully represented a pony in a blown state in a winter atmosphere; and Miss Jekyll contributes a donkey foal, life size, which is boldly painted. Her other picture, No. 334, "Neptune's horses," is extraordinary rather than pleasing, and not quite correct in drawing. It is in drawing that ladies for the most part fail; they *will* make the gentlemen muffs and the ladies silly. If anyone doubts this broad assertion, a visit to this exhibition will alter his opinion, and for that purpose alone the time would not be unprofitably spent.

In the adjoining room, Gustave Doré's illustrations of the "Idylls of the King" have been exhibited for a few days. They are in juxtaposition with the steel engravings published by Moxon. The test may be too severe, but we cannot think the engravings all that could be desired. Many are of opinion that Doré's peculiar style is best adapted to wood-cuts. There is nothing in these engravings that can compare with the wood-cuts of the "Contes Drolatiques," though some are very much in the same style. Gustave Doré has a gift of filling a scene with atmosphere in a manner that no one can rival. In the steel engravings we do not perceive that this effect is successfully given, nor is the peculiar twilight, of which he is so fond, sufficiently adhered to.

NEWGATE.

WHAT a multitude of hideous associations cluster around this building! Most people would be glad to hear that it was about to be removed from the city of London to some suburban locality. In fact, at one time, we believe it was contemplated to do so. The price of land being so fabulously high in the city, it was considered to be a good arrangement to build the prison some three or four miles away and to substitute in its place warehouses and offices. Instead of doing so reasonable a thing, we learn that it is now intended to enlarge Newgate to nearly double its present size. Those who have an eye to public improvements will look upon the proposal with a considerable degree of disgust. Already a great obstruction to traffic, and an eyesore and public nuisance, Newgate will become more intolerable when the splendid new thoroughfare in Holborn is opened, for its dead walls and grim front will be the most prominent object in view citywards. The sensible thing to do in the matter, and which we suggested when its extension was previously mooted, is to carry off the hideous edifice whither modern experience agrees all such unpleasant institutions should be transported.

ARCHITECTURAL ASSOCIATION.

TERRA COTTA.

THE Architectural Association met on Friday evening last to hear a paper read by Mr. Gilbert R. Redgrave, on "Terra Cotta." Mr. R. Phené Spiers, the president, occupied the chair, and there was an unusually large attendance of members present. The secretary announced that Mr. Keith D. Young, 4, The Grove, Highgate-road, Mr. Frederick Russell, 3, Henrietta-street, Brunswick-square, and Mr. Robert J. Worley, 30, Duncan-terrace, N., had been elected members of the Association. With reference to the prize of five guineas, offered by the Committee for the best title-page design for the "Architectural Sketch-Book," the chairman stated that a number of highly creditable designs had been sent in, and the Committee, finding that they could not arrive at a decision as to which was the best, agreed to refer the matter to an umpire. The selection fell upon Mr. Burges, and that gentleman had declared in favour of the design by Mr. Lonsdale. The prize was accordingly awarded to that gentleman, and the decision seemed to meet with the general approval of the meeting. The various designs, together with a number of Gustave Doré's illustrations to Tennyson, were exhibited on the walls of the rooms. The chairman then introduced Mr. Gilbert R. Redgrave, who read his paper, which will be found on another page. A somewhat desultory discussion followed the reading of the paper.

Mr. ALRIDGE was of opinion that terra cotta was not adapted to construction, but thought that it might be used for the purposes of ornament He had seen it so used in Italy with very good effect, and it might be applied effectually for decoration in London buildings. He considered the subject of terra cotta a very interesting one to architects, and he had great pleasure in seconding the vote of thanks to Mr. Redgrave for his able paper, which had been proposed by Mr. Watson.

Mr. POTTER expressed a similar opinion, remarking that for cornices, string courses, and such like, he believed terra cotta was well adapted, but he doubted if it ought to be used for construction. Even for decoration he advocated extreme caution in its use.

Mr. TRAYNOR PERRY exhibited a specimen of glazed terra cotta intended purely for ornamentation. He remarked that the manufacturer was prepared to supply these ornaments at the price of 5s. a piece. They were 9in. square each, and might be either fixed with screws, or simply bedded in the cement.

Mr. BLASHILL said he would be sorry to advocate the use of terra cotta for ornamentation, if he could not use it constructively. It appeared to him, however, to be more suitable for decoration than stone on a brick building, and he believed it would also be cheaper. It would be an advantage he thought if the material could be obtained with a surface that could be washed. As regarded construction he saw no reason to distrust it, and he would recommend Mr. Redgrave to make some further experiments with it. It would be much better, he conceived, to employ stone for the purpose of strengthening cornices rather than iron, as shown in Mr. Redgrave's drawing. He was sure they were all agreed as to the valuable nature of the paper read, and he hoped it would be published for the information of the members of the Association.

Mr. MATTHEWS objected to terra cotta as a material for construction. One objection to its use would be the difficulty of getting truly horizontal lines, and another, the difficulty of getting the blocks to dry with sufficient accuracy. He was afraid they could not be made so accurate as they ought to be. Very great precaution would be necessary to prevent or to provide for shrinkage. He could not help thinking, with Mr. Redgrave, however, that terra cotta must sooner or later come into extensive use as a decorative material.

A member here asked whether Mr. Redgrave could insure a uniform colour in the terra cotta blocks, as it would present a very bad effect to have different colours in the string-courses of a building. Terra cotta, it was mentioned, had been used at the church in Aberdeen Park, Islington, and the result was not at all satisfactory.

A manufacturer of the material who was present stated that, with regard to the light yellow or white terra cotta, a tolerably uniform colour could be insured, though he thought a little variation in colour would be rather in its favour. It was also remarked that the greater the depth from which the clay was taken, the less it had been found was the shrinkage.

The CHAIRMAN said that the subject was a highly interesting one, but he thought it came to them to a great extent unprepared. They had had very little experience of terra cotta, and were scarcely prepared to understand it fully. He believed that the paper which had just been read would be one of the most valuable of the records of the Association. Terra cotta, he remarked, was as lasting and durable as a rock, being much harder than any stone we had for building purposes, and it possessed this other great advantage, that it was applicable to the highest artistic skill. It was a question whether glazed materials should be used in decoration. A paper had lately appeared in one of the

professional journals in favour of glazed tiles for London buildings. He should be very sorry to see glazed tiles ever introduced, nor could he say he was much in favour of polished granite, as a rule, for ornamentation. It could hardly be said that you got colour from polished granite—it was only reflection.

Mr. REDGRAVE, in acknowledging the vote of thanks, remarked that, as regarded the objections to the use of terra cotta structurally, he thought they had only to look at the buildings for which it had been employed, and to which he had alluded in his paper, to judge of its adaptability as regards both appearance and strength. As far as resisting weight was concerned, he thought it would compare very favourably with other building materials. It was true that terra cotta was, to a certain extent, a treacherous material, and hence the precaution, if not the necessity, of introducing iron, as in the case of the cornice and column which he had described. But the fact was, that the manufacture of this material was at present in a very crude state; he had no doubt the time would come when we should be able to calculate its strength and bearing qualities to a nicety. When it became better known, the architect, as well as the builder, would have no difficulty in dealing with terra cotta.

BREADTH IN ART.

UNDER this heading there is an article in a late number of the "Leader" which says, if we turn from music to architecture (an art which, both in the metaphysical groundwork of its effects, and in its peculiar indefinite yet unlimited power of expression, has strong affinities with music), we shall, perhaps, see exemplified more strikingly than in any other form the "strange disease of modern life," the tendency to elaborate littleness and frittering, the absence of that spirit of self-restraint and concentration in the artist, that expression of calm dignity in the art, which shine with such a lustre through the decaying relics of the Grecian temples. Consider, for a moment, the simplicity of the means whereby the building which more than any other has been the object of universal admiration produces its marvellous unity of effect. The Parthenon has no play of skyline, no picturesque grouping of masses to attract us; only a simple cubical block of building, surrounded by the deep broad shadow of its long colonnade, all the columns of which are precisely similar, and are ornamented just to that degree which enhances the appearance of strength and suitability to their position; and, though of a design which, looking at one column singly, might appear tame and uninteresting, yet striking irresistibly upon us when displayed one after another in long unbroken succession. The same principle of repetition is carried out in the smallest details; the architect, having designed carefully an effective ornament, not disdaining to repeat it all round the building, knowing that he should thus best be securing the consistency of the total effect. The ornament, again, is so placed as not to encumber but rather to emphasise the constructive portions of the building; and even the sculpture is by a certain rigidity and simplicity of line prevented from unduly obtruding itself, and is harmonized with and (to continue the metaphor) brought into the key of the building; which thus exhibits all its parts as subordinate and yet accessory to the total effect, and strikes upon the eye, like a chord of music on the ear, as one complete whole. We would not, for a moment, advocate the revival in modern England of the style of ancient Greece; but it is worth while to contrast the calm repose of such a building with the kind of architecture now most in vogue—the fidgetty, angular, crotchetty designs which are perpetually rising up around us, where the only attempt apparently is to astonish and distract the eye, to cover every part of the building with ill-considered, over-wrought ornament, laid on indiscriminately, without purpose or meaning; while outline is obtained, not as the result of the natural or convenient grouping of the buildings, but is violently produced by twisting the roofs into unmeaning and fantastic forms, and sprouting useless turrets at every angle. Notably, we think, was the disease of art manifested in the late important competition among some of our leading architects for the erection of the New Law-Courts, where all the talent and ingenuity evinced in the drawings and in the treatment of detached portions could not disguise the fact, that not one of the competitors had taken a broad and comprehensive grasp of his subject, all of them covering their defects by a surfeit of applied ornament, and in some instances showing a fantastic babel of towers, domes, and turrets—a studied, and, therefore, repulsive, irregularity and want of symmetry among the different parts—which rendered their designs a sort of Chinese puzzle, in which neither order nor motive could be discovered. And this is but one notable example of the prevailing spirit which is exhibiting itself in nearly all our architecture, which is familiar to all who examine the exhibitions of "competition" drawings, and is filling our streets with grotesque objects on which our descendants—perhaps even ourselves, in a few years—will gaze with mingled feelings of astonishment and dismay.

SLIPPERY PAVEMENTS.

DR. WHITMORE, Medical Officer of Health for Marylebone, calls attention, in his last monthly report, to the condition of the pavements when snow is on the ground. He says the number of accidents taken to the Middlesex Hospital during the past month amounted to 367, of which a very considerable proportion were caused by the slippery condition of the roads and footways. Every one accustomed to daily walking in our public streets, must have felt, during the past fortnight, that he was incurring considerable personal risk; the neglect of many householders in not properly removing snow and frozen mud from the pavement in front of their dwellings cannot be too severely censured, and merits a greater punishment than the law—as it at present exists—has the power to inflict. But even the law, as it stands, is rarely, if ever, properly enforced. After a heavy fall of snow, the policeman knocks at the door, and directs the pavement to be swept; this is probably done, but in so imperfect and slovenly a manner that the risk of falling is materially increased by it; the policeman, however, is not called upon to judge of the efficiency of the operation—his mandate has been obeyed, and he is content. He goes on to say that, "Until the law on this point is rendered more stringent and more compulsory, the evil will continue, an evil, not only fraught with danger to life and limb, but highly discreditable to the municipal regulations of this great metropolis. I have been informed that on the 10th of the present month, 32 accidents (occasioned by the slippery state of the pavements) were taken to the Middlesex Hospital in the short space of two hours."

Dr. Whitmore says nothing about coal plates inserted in the pavements. These are frequently as smooth as glass, and when snow or sleet is falling, the person walking, not seeing the coal plate, slips on it, and frequently slips down. If these plates in all instances were rough, many accidents would be prevented.

BUILDING AND LAND SOCIETIES.

THE progress made by the National Temperance Land and Building Company during the past year looks very encouraging, judging from the report of the directors which was read at the annual meeting on Monday last. During the year the company have advanced upon the mortgage security of freehold and leasehold property the sum of £8,610, making a total of £13,155 advanced since the commencement of the company. A balance of £1,019 on the business account of the year the directors recommended to be appropriated in the following manner:—To the repayment of one-seventh of the preliminary expenses; to carry £110 to a reserve fund; to pay a dividend at the rate of 10 per cent. on the paid-up capital; and a balance of £138 to the current account of the company. The report was unanimously adopted. Messrs. Robinson, Hazelgrove, Malings, and Stringer, were re-elected directors, and Messrs. Crane, Newbury, and Sims, auditors of the company. The meeting took place at the Whittington Club, Mr. H. Robinson, of Lewisham, presiding.

The first ordinary meeting of the shareholders of the Artizans', Labourers', and General Dwellings Company (Limited) was held at 147, Strand, on Monday, Mr. W. H. Bennett in the chair. The report for the year ending Jan. 4, 1868, stated that, although it extended over a period of one year, the practical operations extended over seven months only. The paid-up capital amounted to £502 10s. The loans on deposit have been £817 19s. 5d., of which £312 14s. 11d. had been withdrawn, leaving a balance of £505 4s. 6d. The preliminary and working expenses of the company had amounted to £453 9s. 4½d.; the payment of this amount the board recommended should be extended over a period of five years. The net profit had amounted to £139 18s. 11d. The board had decided upon foregoing their fees for the past year. The company was worked upon the co-operative principle, employing the labour of shareholders in the erection of the dwellings, and the profit realized by the workmen had amounted to at least 40 per cent. over their wages, independent of the company's profits. The chairman moved the adoption of the report, which was seconded by Mr. Lowe and carried unanimously, and a dividend at the rate of 7½ per cent. per annum was declared.

The eighteenth annual report of the National Freehold Land Society, to be presented to the meeting of shareholders to be held to-day, shows that the deposits have exceeded those of the previous year by £176,888, whereas the withdrawals have only exceeded those for the same period by £32,369. The "members' capital" has increased by £210,799. In consequence of the unprecedented influx of money (owing principally to the low rate of interest obtainable elsewhere), the directors felt it necessary, in August, to reduce the rate of interest from 5 to 4 per cent., but this step has not led to any considerable increase in the amount withdrawn. Having regard to the increase in the amount of business, the directors have added £5,000 to the reserve fund, which now amounts to £10,000. A further sum of £27,337 has been added to "convertible securities," increasing that fund to £129,186. Of the net profit brought forward last year (£20,397), the amount added to uncompleted shares was £16,259, leaving a surplus of £4,138. The net profit this year (after deducting the £5,000 carried to the reserve fund) is £21,829, of which the amount added to uncompleted shares will be about £18,800, leaving about £3,029 to carry forward to the next account.

Building Intelligence.

CHURCHES AND CHAPELS.

The foundation stone of a new Scandinavian Church at Leith for the benefit of Danish, Swedish, and Norwegian sailors visiting that port, was laid last week. The plans of the edifice, which is to be in modern Gothic style, have been prepared by Mr. James Simpson, architect, Leith, on the basis of a design drawn by Mr. Johan Schroder, architect, Copenhagen, and presented by him to the committee.

St. John's Church, Leeds, was reopened on Sunday last, after restoration, by the Bishop of Ripon. Mr. George Gilbert Scott, in 1865, when consulted as to the advisability of its restoration, stated that in this church Leeds had a specimen of church architecture to which no other town in England could produce a parallel. In distribution it resembled a common and simple type of a mediæval church, being of two equal spans, covered uniformly from end to end with a somewhat high pitched open roof, the two spans being divided by a range of seven similar arches unbroken by a chancel arch, the absence of which was, however, compensated by a very bold and rich oak screen crossing both spans. The restoration has been very thorough and complete, under the direction of Mr. Norman Shaw, of London. A mosaic reredos executed by Signor Salviati has also been erected. The church as altered will seat about 1,000 persons. The works have been carried out at a cost of about £4,000.

A new church dedicated to St. John is about to be erected in St. George's-in-the-East, at a cost (without the tower) of £3,500. The building will be of a plain and substantial character, and all the sittings will be free.

It has been determined to erect a memorial church in honour of the late Dr. John Lonsdale, Bishop of Lichfield, in the town of Derby, which forms part of the diocese over which he so long presided. The new church will be dedicated to St. Luke, and will be erected between the new Uttoxeter and Burton roads, popularly known by the name of "California." It will be constructed to accommodate 650 persons, all the seats being unappropriated and entirely free.

Nidd Church, Yorkshire, was opened on Tuesday last, by the Bishop of Ripon. The present building is on the site of an old church which had fallen to decay, and the foundation stone was laid in August, 1866. The architects are Messrs. T. H. and F. Healey, of Bradford, and the contractors Messrs. Fawcett, of Harrogate. It is built in the Early Decorated Gothic style, with plain simple nave and chancel. The pulpit, lectern, and chancel fittings, are of a more elaborate character. The floors are laid with Maw's Staffordshire tiles.

It is proposed to build a new parish church at Acol, Kent. The site has been secured and the designs prepared by Mr. W. L. Sear, of Margate. The structure will be in the Perpendicular style, and will be built of brick, faced with Kentish rag. It will accommodate 300 persons.

DUBLIN.—The foundation stone of the new church of St. Bartholomew, Elgin-road, was laid in 1865, and the edifice was consecrated in December last. It contains sittings for 550 persons, and has been erected, from the designs of Mr. Thomas H. Wyatt, architect, of London, by Mr. James Scanlan, builder. The style adopted is Early English, and the arrangements partake of the cathedral type. The plan consists of a nave, with open porches at north and south sides; double transepts, each opening into the nave by double arches at each side. The tower is raised over the choir, beyond which is an apsidal chancel; at each side of choir are aisles, forming vestry and organ room respectively. The width of the nave is 27ft., the transepts are 77ft. across and 32ft. wide, the choir and chancel are 18ft. wide, and the total length internally is 128ft. The walls are faced with Dalkey granite, and the dressings are of Hollington stone. The inner faces of all the walls were coated with Stockholm pitch, previous to being plastered, as damp preventive. The columns of porch-doors are of polished Aberdeen granite; the columns in nave and transepts are of Cork red marble, and the internal dressings of Caen stone. The new church has cost about £7,000.

BUILDINGS.

A railway tunnel, nearly 3,000ft. long, has just been completed at Constantia, in Algeria.

A new school has been erected in connection with All Saints' Church, Little Horton-green, near Bradford, from the designs of Messrs. Healey, of Bradford. The building is in the Gothic style, and comprises boys' and girls' schools, each 67ft. long by 21ft. wide, and an infants' school, 60ft. long by 20ft. wide. The cost has been about £6,000.

The new Wesleyan college at Adelaide, the foundation stone of which was laid by Prince Alfred in November—is estimated to cost from £26,000 to £30,000. The college has been named after his Royal Highness, and is to be devoted primarily to the training of youths connected with the Wesleyan Church. The style adopted is the Elizabethan.

A new brewery at Northampton, belonging to Messrs. P. and R. Phipps, has just been completed. The building was erected by Mr. Dunkley, builder, of Northampton, at a cost of £22,000, from the designs of Messrs. Davison and Scammell, architects and engineers, of London.

The foundation stone of a new Corn-Exchange at Luton has been laid. The style of the new building, which will be erected on the site of the old market place, is Venetian Gothic, and the cost will be about £2,550. The architects are Messrs. Messenger and Grundy, of London, and the builders Messrs. Stuart Bros., of Luton.

The new wing at the rear of the City of Dublin Hospital has recently been opened. The building consists of two storeys, 15ft. high; the front elevation affording a good example of hammer-dressed masonry. The works have been carried out by Mr. W. H. Beardwood, under the direction of the architect, Mr. C. Geoghegan, of Dublin.

The Friends' Meeting-House, Kettering, which has been for some time in course of erection on the site of the old meeting house, has recently been completed. The architect was Mr. R. W. Johnson, of Melton and Leicester.

Among the new buildings projected in Belfast, are a new Townhall, the National Bank, the Central Railway Station, a Masonic Hall, and a Working Men's Institute. It appears that the erection of the Albert Memorial here is at a standstill, in consequence of a monetary dispute with the contractor. We understand that the funds are about £500 short.

The new Mechanics' Institution, in New Bridge-street, Newcastle, was opened on Tuesday last. The old building was in Blackett-street, and it had long been felt to be thoroughly inadequate to the requirements. The foundation stone of the new building was laid by Sir George Grey nearly three years ago. Its erection was much interfered with by the protracted masons' strike. The cost of the new building will be about £4,000.

A site has been secured for the new Infirmary and Dispensary at Burton-on Trent, and the Building Committee have selected the design of Mr. Edward Holmes, of Birmingham, which was submitted in limited competition. The works will be forthwith commenced.

In our account of the Ipswich Townhall, last week, Messrs. Bellamy and Hardy, of Lincoln, were described as contractors, instead of architects. Mr. Edward Gibbons, of Ipswich, was the contractor, and Mr. Edward Catchpole, of the same town, the clerk of the works.

WATER SUPPLY AND SANITARY MATTERS.

The sewer authority for the newly formed district of the Scawby portion of Brigg, Lincolnshire, is actively proceeding with the works of drainage for that district. The main culvert (which is 2ft. in diameter) has been laid with very little interference with the buildings, one house only requiring to be tunnelled under. Mr. W. C. Atkinson, of Brigg, is the engineer and surveyor.

The net cost of scavenging the town of Liverpool last year was £54,017, against £40,247 in the previous year, the increase being ascribed to the extension of the borough, the raising of scavengers' wages, and the greater distance to which the scavenging products have to be removed. Nearly 241,000 tons of refuse have been removed during the year, at a cost of 4s. 6¼d. per ton.

TO CORRESPONDENTS.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

SANDGATE TOWNHALL COMPETITION. A CAUTION.

To the Editor of the BUILDING NEWS.

SIR,—In your paper of the 31st ult. appeared an advertisement inviting architects to submit plans in competition for this undertaking, and, feeling a desire of becoming a competitor, I took a run down to Sandgate, which is a pretty little town on the Kentish coast. Having called at the residence of the chairman, who was absent, I made several inquiries of parties connected with the undertaking, but ultimately was directed to a Mr. Pledge, auctioneer, estate agent, chairman of Board of Health, and recently owner of the townhall site, who, being secretary to the company, would be likely to give me any information I required. It is with a view of giving those members of the profession who intend competing the benefit of my interview with the secretary, that I beg a space in your columns for the insertion of this letter. In answer to my inquiry as to on what terms architects compete, I was informed that, in the event of the directors not being able to come to terms with the successful competitor, a sum of three guineas would be paid him, and his plans thereby become the property of the company, who would employ some practical man to carry out the design. On gaining this information, my mind was at once made up, and I saw that the trouble of my journey had been thrown away; but imagine my surprise when, in answer to some questions as to the accommodation required, this secretary of the company informed me that he could scarcely answer such questions as he had himself resolved to become a competitor, and, should he become the successful one, would make his plans a present to the company. But, in answer to one of my questions, he did not mind (as he said) telling me that the large hall would be better at the back than at the front of the building, which, considering him to be a competitor, was rather a smart stroke of policy on his part, as, of all places, the back would be the last an architect would pick, after having examined the peculiarity of the site. My object in writing this letter has been to give intending competitors these facts that they may be on their guard, and judge for themselves whether they had not better devote their time and money to a better purpose than preparing competition drawings for Sandgate Townhall, and if, by so doing, I shall be the means of saving any from entering this most scandalous of all competitions, I shall feel amply repaid for all my trouble, by having benefited members of my own profession. The facts here mentioned ought surely to be sufficient to show the Institute of British Architects that the time has arrived for their interference, and the only thing left them to do is to draw up a code of instructions regulating competitions, and call upon all architects to subscribe their names thereto, thereby pledging themselves to enter no competition where these instructions have not been adopted.—I am, &c. S. S. S.

Intercommunication.

QUESTIONS.

[732]—ELASTIC MOULDS.—Can anyone inform me how to make and use the composition of which elastic moulds are composed?—DIDUS.

[733]—CEMENT AND GRAVEL.—An article, headed "Cement and Gravel," appeared in the BUILDING NEWS of December 13, 1867, page 863, in which the author informs us of a cheap description of building material, but did not state whether Portland or Roman cement should be used, nor the proportion of the same with the gravel that would bear the weight of a wall, say 20ft. high. If Mr. W. May, or any other of your subscribers, would kindly inform me in your next impression, I shall feel much obliged.—PLEBS.

[734]—BUILDING MATERIALS IN NEW ZEALAND.—Can any of your readers give me information as to the building productions of New Zealand, or where I can get information, useful for an intending emigrant, as to the colony generally. Are there any works published about it?—E. T.

[735]—STREET LAMPS.—Can any of your numerous readers inform me, through your valuable "Intercommunication," why the street lamps along Pall Mall have crimson glass crosses placed on them?—INQUIRER.

[736]—RESERVOIR BOTTOMS.—I have occasion to convert a large pond into an open reservoir, capable of holding water to supply the cisterns at a large establishment. Could you, or any of your numerous readers, inform me what would be the best material to form the bottom with, so as to prevent vegetation, and when emptied occasionally could be easily cleaned? The present bottom is formed of puddled clay.—J. W. H.

[737]—CAEN STONE.—This stone is generally objected to by architects for the reason that it will not resist the dissolving power of water charged with carbonic acid gas. I should be obliged if some of your readers would instance any buildings in the metropolis, or elsewhere, where this stone has been largely used and has proved a failure.—PLYMOUTH.

[738]—MILK OF WAX VARNISH.—Can any of your subscribers give me the formula of the preparation of this, I believe, valuable varnish? It is used for spreading over the surfaces of paintings; and I have heard that, to the unchangeable quality of this, or some similar substance, the ancient paintings found on the walls of Herculaneum and Pompeii owe their freshness at the present day.—H. B.

[739]—LIZARD AND FROG.—I have some sketches of columns of some Roman churches, and on the pedestals appear to be sculptured a lizard and frog, or some similar animals. Can any of your readers give me the meaning of this symbol, if a symbol it be?—PHILO.

REPLIES.

[703]—CRACKED BOILER.—If your boiler has any pressure of steam in it, the injury is irreparable, but, if, as I suppose from the case, there is very little pressure, you may caulk it up with iron cement. The following is commonly used for the purpose:—Take by weight one part of sal ammoniac in powder; two parts of sulphur, and eighty parts of iron borings, or filings. You should not allow a greater pressure than 5lbs. to come upon your boiler so mended. As a rule, cast-iron boilers are bad, and always liable to crack, and so become of no use.—A FITTER.

704.]—COMPOSITION FOR FLOORS.—A floor formed with the best Portland cement concrete, composed of rather fine gravel, would answer perfectly well for his purpose. When once set, it requires nothing less than a pick forcibly driven in to break it up. It is also very clean, and a good non-conductor of heat.—L. S.

[713.]—ASHPITS.—Your correspondent is quite correct about the impression he entertains that the ammonia would destroy wrought iron, which it certainly will do, although we have before us the fact that sewage which contains a large amount of ammonia is conveyed over obstacles in wrought iron tubes upon the metropolitan main drainage system. It has not, however, the same injurious effect upon cast iron, which also, by being comparatively thicker when made for the purpose than the other material, can afford to be slightly corroded with impunity. A cast iron frame ought to answer the requirements of J. M.—FOUNDRY.

[717.]—RED PINE GIRDER.—X. last week gave Tarn's formula for flitch girders, which requires that the thickness of the wood be to that of the iron as 20 to 1, so that the resistance to deflection may be the same in both materials. The difference between the breaking weights is not thereby corrected, and a girder so constructed is far from being perfect. Take one 10in. deep and 10ft. bearing, made up in thickness of two red pine flitches, each 5in. wide, and an ¼in. wrought iron plate. According to Mr. Tarn, the permanent load on the middle will be 91·13cwts. Suppose this load to be applied, it will be supported, 45·56cwts. by the wood and 45·57cwts. by the iron, because, by construction, the resistances to deflection are equal; but the safe permanent load for the wood is $c \frac{b.\ d^2}{l} = 100$cwts., and for the iron is 31·25cwts.; and thus it is seen that the wood is carrying over 54 per cent. less, and the iron nearly 50 per cent more than the limit of safety determines.—PURLIN.

[726.]—ZINC.—A thin oxide rapidly forms on zinc when it is exposed to the air. This, however, prevents further action.—ECCE.

[726.]—The thin, compact film of oxide, or rust, with which the surface of zinc becomes coated when exposed to a moist atmosphere, seems to protect it from further oxidation. Hence the value of zinc as a material for roofing, and also for protecting the surface of iron roofs. We may remark that the many valuable properties of this metal are daily becoming better known. At ordinary temperatures, zinc, according to "Chambers' Encyclopædia," is a comparatively brittle metal; but it was discovered that, if heated to between 200° and 300° Fah., its malleability and ductility were so increased that it could be rolled with facility into thin sheets, or drawn into fine wire. Since this discovery was made, about fifty years ago, the uses of the metal, which was formerly employed along with copper to make brass, have become greatly extended. In sheets, it is now used for roofing, baths, water tanks, sponting, and the like; also for covering ship's bottoms instead of copper. A considerable quantity is consumed for name plates, for engraving upon, and for galvanic batteries. Perforated sheets, with various ornamental patterns, are manufactured for screens, blinds, ventilators, light fences, and similar objects. As a material for casting artistic works, zinc possesses the desirable properties of having a low melting point, and of taking a sharp impression from the mould, so as to require little labour from the chaser; it has also considerable hardness. It has, in consequence, become a favourite material on the Continent for making casts of statues, statuettes, and different kinds of ornaments. Now, of late years, it has been applied with great success to the coating of sheet iron roofing, and also for coating various kinds of iron wire, especially telegraphic wire.—R. K.

[729.]—HYDRAULIC CEMENT.—I beg to reply to a reader's query in last week's Intercommunication as to hydraulic cement. If a hydraulic lime be calcined at too high a temperature, the silicate undergoes partial fusion, and will not set afterwards under water. The heat for burning the limestones should, therefore, be just high enough to expel the water from the clay, and the greater part of the carbonic acid from the carbonate of lime. To answer to the other part of your correspondent's question, it is found that the clays best adapted for the manufacture of artificial puzzolana are such as are greasy to the touch. As a general rule clays containing limes and other metallic oxides, especially alkalis, become energetic at low temperatures, whereas the poorer clays will give good results when calcined at a very high temperature, and they have this other disadvantage of being difficult to reduce to powder.—O. F.

WAGES MOVEMENT.

Through the nail-making districts in the neighbourhood of Sedgley, Hants, in consequence of the depression in the nail trade, Mrs. Tinsley (who is said to employ between 2,000 and 3,000 nailers) has reduced the wages of the makers of all kinds of nails 20 per cent.

The slaters of Glasgow have struck work for a rise of wages. Their present wages are 5½d. per hour, and they ask an increase of ½d., thereby, as they state, making the wages uniform with those paid in Edinburgh, Dundee, and Greenock. The agitation for this rise is said to have continued during the last twelve months.

The operatives connected with the building trade of Sunderland have asked their employers for concessions, the chief of which are that the men shall work nine hours a day, and four and a half hours on Saturdays, ending at twelve o'clock; wages to be paid precisely at that hour; walking time of an hour to every three miles, for country work, to be allowed, starting from the Blue House, the Infirmary, or Wheat Sheaf Inn: that the masters provide sheds for the workmen, or pay them one-half for lost time. The master builders have appointed a sub committee to consider the matter.

STAINED GLASS.

Another stained glass window has been added to those already erected in the Guildhall, at York. It represents the history of the city during the Plantagenet period; the principal events delineated being the confirmation of the Great Charter in Parliament, held at York, in 1298, by Edward I. The window was designed by Mr. J. E. Doyle, author of "The Chronicles of England"; and was executed by Mr. Wailes, of Newcastle.

A stained glass window, by Messrs. Hardman, has just been inserted in the east window of the lady chapel of St. Neot's Church. This window is the one chosen out of a great number to receive the silver medal at Paris, and cost £245.

LEGAL INTELLIGENCE.

ALLEGED NON-PERFORMANCE OF CONTRACT.—TIDEY v. SHARMAN.—Both parties to this suit were builders, the plaintiff carrying on business at Bellsize Park, and the defendant in Liverpool-road, Islington. The action was brought in the Court of Common Pleas, to recover damages for the non-performance of a contract. The plaintiff's case was that the defendant had been employed by Mr. Defries to lay down some flooring at the Agricultural Hall to be used at the great volunteer ball. After it was no longer wanted, the defendant authorized Mr. Mabbett to sell upon commission, and this gentleman contracted to sell to the plaintiff 750 squares of flooring at 10s. a square, and 20,000ft. of quartering at a halfpenny a foot. The defendant, however, would not carry out the contract, and the plaintiff calculated that his consequent loss was £379. The defence was that the defendant never had any idea of selling the flooring, and never authorized Mr. Mabbett to sell. Further, that he could not have agreed to sell 750 squares, inasmuch as there were only 272 squares there. There was also a good deal of contradictory evidence as to some alleged statements of the plaintiff, by which he recognised the contract. The jury found for the defendant.

IMPORTANT TO BUILDERS.—BROMPTON COUNTY COURT.—The plaintiff, Bartlet, sued the defendant, Elliott, for 13s. 4d., which he claimed for twenty hours' work at 8d. per hour, which claim defendant disputed on account of the injury sustained through the incompetence and ignorance of the plaintiff. The defendant, it appeared, had to finish a pawnbroker's shop where a well had to be put in through three floors. The plaintiff was told to take up the flooring boards for defendant to see where the trimmers were placed, so that they might not be cut. Next morning when defendant went to see how the well could be put in, he found one of the main trimmers cut off, which, it was alleged, might easily have been avoided. Plaintiff was discharged without being paid for the time claimed, and he brought the action to recover the amount. Judgment for the defendant, the judge remarking that the plaintiff had not taken sufficient care, nor paid that attention to his work which he ought to have done.

CONTRACT WORK.—The Court of Exchequer has reversed a decision of the Court of Common Pleas in the case of Appleby v. Myers. The plaintiff had contracted with the defendant to supply and put up on the defendant's premises an engine and certain machinery, for which he was to be paid a lump sum on completion. When a portion of the machinery had been put up and fixed, but before the whole was completed, an accidental fire broke out on the defendant's premises which destroyed the buildings, and with them much of the plaintiff's work, and the further performance of the contract was rendered impossible. The Court held that the plaintiff was not entitled to recover the contract price of the work or any portion of it—the premises having been destroyed by inevitable accident, and without fault on either side, excused both from the further performance of the contract, but giving a right of action to neither.

PROFESSIONAL CLAIMS.—RANDAL v. GRAY.—The plaintiff, Mr. J. L. Randal, architect, of Shrewsbury, sued the Rev. Loftus S. Gray, late of Pontesbury, now of Sedgeberrow Rectery, in Worcestershire, for the recovery of £50, for professional services rendered and expenses incurred, in carrying out some alterations in the defendant's residence. The case was tried, at the Shrewsbury County Court, by jury. From the opening speech of Mr. Chandler it appeared the items of the account were as follows:—Drawing out of plans, specifications, &c., and the superintendence of the work to completion, £63 13s. 9d.; drawing of additional plans, preparing a description of the alterations, and making an affidavit for obtaining the Queen Anne's Grant, £10 10s.; journey to Sedgeberrow and measuring up of the extra work, taking an account of the "omissions," and examining the work for the final certificate, £9 9s. 6d.; nine journeys, £31 10s.; total, £115 3s. 3d. On account of this sum £60 had been paid, and the balance was reduced to £50 to bring it within the jurisdiction of the court. Mr. J. L. Randal stated that his charges were regulated by the scale published by the Royal Institute of British Architects, a copy of which was produced in court. Mr. W. H. Spaull, Mr. Thomas Groves, and Mr. Edward Haycock, jun., architects, stated that they considered the items charged perfectly fair and reasonable. For the defence, Mr. Buckton urged that £115 3s. 3d., which was the original amount of Mr. Randal's bill, was indeed a large sum for drawing out a few plans and nine days' superintendence of the works. They had nothing to say against the 5 per cent. commission; but to charge £1 1s. per day extra, as was charged and included in the £31 10s, was unfair—it was, in reality, charging twice over. The charge of £10 10s. for preparing the plans to be sent to London was also exorbitant. They were merely tracings of the original plans, and were not worth anything like the money. He believed the jury would agree with him that the £60 which had been paid was amply sufficient for what Mr. Randal had done. Mr. Buckton then called Mr. Burdett, a clerk of works, who stated that the quality of the work did not in some cases correspond with that laid down in the specification. He stated that he did not know whether Mr. Randal had employed a clerk of works, and that when he himself went from home he expected to be paid his expenses and time. The case was then put before the jury, who returned a verdict of £47 1s. 3d.

TWO DAYS' NOTICE TO DISTRICT SURVEYOR.

TOLLEY v. KELK, WARING BROTHERS, AND LUCAS.—In Westminster Police Court, on Saturday last, Messrs. Kelk, Waring Brothers, and Lucas were summoned by Mr. James Tolley, District Surveyor of St. Margaret, St. John, and St. Peter, Westminster, for not complying with the 38th section of the Metropolitan Building Act, which requires two days' notice in writing before any building, or any work in, to, or upon any building, is commenced, to be given to the District Surveyor, under a penalty of £20, to be recovered before a Justice of the Peace. The District Surveyor conducted his own case; Mr. Joyce, instructed by Messrs. Baxter, Rose, and Norton, appeared for the defendants.

From the opening speech of the District Surveyor, it appeared that the defendants, as contractors for the Metropolitan District Railway, had taken down a house, No. 1, Smith's place, York-street, and reconstructed the greater part of what was originally a party wall between Nos. 1 and 2 as an external wall to No. 2, which work, he submitted, required notice under section 38. He then proved service of notice on January 16, calling defendants' attention to their neglect.

Mr. Joyce claimed exemption for the work under the sixth section of the act, and stated that the wall was erected upon ground belonging to the railway company, and, although they were not actually using the wall at present, they could, and probably might, use it for affixing signals or placarding with notices.

The District Surveyor said, assuming it to be a party wall, half belonging to the railway company, that he was entitled to notice for the other half, and begged to inform the learned counsel that he was in error in stating that the ground belonged to the railway company.

Mr. Arnold:—The railway company cannot have the right to cut a hole through the wall into a gentleman's drawing room, for instance.

John Marr Ingall was called and examined by the District Surveyor:—I reside at No. 50, York-street, Westminster. I am owner of No. 2, Smith's place, and the adjoining houses. The railway company purchased No. 1, and caused it to be pulled down. The wall erected is in lieu of the party wall originally existing between Nos. 1 and 2. The wall is entirely on my ground. I produce the deeds with plan annexed.

Cross-examined:—Taking down the wall left the rooms exposed. It was necessary to rebuild it; the house was dangerous without. I believe it is done properly.

The District Surveyor remarked that making it a case of emergency would not help the other side, as section 44 made it a condition that, before the expiration of twenty four hours after such work has been begun, notice thereof shall be given to the District Surveyor.

Mr. Arnold, in summing up, said—I never had a clearer case, and cannot understand upon what grounds the defence was undertaken, except, as the learned counsel has stated, under mistake; but, as this is the first case against the defendants, and in consideration of your request, I think the object sought will be obtained by the infliction of a nominal penalty of one shilling and costs; but, should another case be proved against the same parties before me, I shall feel it my duty to impose the full penalty, viz., £20.

MEETINGS FOR THE WEEK.

MON.—Society of Arts, Cantor Lectures, "Adulteration of Food." Conclusion.

TUES.—Institute of Civil Engineers. Renewed Discussion upon first, "Fresh Water Floods of Rivers;" second, "Floods in the Nerbudda Valley;" and, should time permit, the following paper will be read, "On the Supporting Power of Piles, and on the Pneumatic Process of Driving Iron Columns," by J. M'Alpine, M. Inst. C.E., at 8.

WED.—Society of Arts, on "The Supply of Animal Food to Britain, and the means proposed for increasing it," by W. L. Scott, Esq., F.C.S.

FRI.—Architectural Association, "Symmetry, from a Gothic Point of View," by E. J. Tarver, Esq., A.R.I.B.A.

SAT.—Associated Arts Institute, "On the Practical Value of Theory," by A. H. Wall.

Our Office Table.

The Italian government has granted three privileges for boring wells on the territories of Farnuove, Taro, and Medesanio. Two of them have been given to American capitalists.

Mr. Lyster, the engineer to the Mersey Dock Board, has reported to that body that the amount required to complete the dock works in progress and in contemplation is £700,694.

The Masonic Brotherhood of Philadelphia are about to build a granite structure, 250ft. long by 150ft. wide, with a tower 300ft. in height. It will cost nearly 1,000,000 dols.

A new litany-desk, which the "Ecclesiologist" describes as of unusual beauty, has been presented to the church of St. Andrew, Wells-street, by an anonymous donor. It is from the design of Mr. Burges. On one side, in the upright support, is a well-carved figure of "Zacharias, the son of Barachias," offering incense; on the opposite side is a figure of the prophet Joel. In front there are two open richly-carved arched panels, between which is a figure of St. Andrew. In the spandrels of the two arches are very felicitously designed groups of St. Michael and St. George, each slaying his dragon. The uprights on each side end at the top in particularly graceful figures of angels swinging censers. The idea embodied is, of course, that the litany-desk in a Christian church represents in a manner the "Altar of Incense" in the Temple. In front is the legend, "Libera nos Domine," and the date of the year, inlaid in maple-wood on the walnut; and the surface of the desk itself is admirably inlaid with the emblems of the Passion. We have seldom seen better figure sculpture. It was all carved, we believe, from careful clay models. The work was executed by Mr. Robinson, of High Holborn.

The method employed by M. Chevreul, of Paris, for renovating ancient stained-glass is as follows—the glass is removed from its setting and immersed for several days in a solution of carbonate of soda of a specific gravity of 1·068. It is then washed, and dipped for a few hours in a solution of hydrochloric acid of the specific gravity of 1·08.

A grand International Exhibition of Fine Arts s announced to take place in Berlin in the months of September and October next. Particulars are promised shortly.

Mr. William J. Richardson and Mr. George Leslie have been elected associate painters, and Mr. Thomas Landseer, associate engraver, of the Royal Academy. No architects' or sculptors' names were balloted for at the meeting which took place on Friday.

The local examinations in drawing of the second grade of the Science and Art Department are announced to take place on the 10th, 11th, and 12th of March next. The examinations will be held at South Kensington, and also at the various Schools of Art and night classes established under local committees throughout the country.

As a lasting memorial of the genius of John Philip, R.A., it is proposed, we hear, to endow a prize medal to be named after him, open to triennial competition by the students of the Royal Academy, for the best picture of English domestic life. Funds are now being raised for this purpose, as also for the purpose of enabling his friends and admirers to place a granite slab over the grave of the painter in Kensal green.

The members of the Royal Institute of Architects of Ireland have given a dinner to their president, Sir Charles Lanyon, M.P., who has just had the honour of knighthood conferred upon him. The banquet took place in Dublin yesterday.

At the annual meeting of the Kilkenny and South-East of Ireland Archæological Society, which took place on the 22nd ult., it was unanimously decided to change the name of the Society to that of the Archæological and Historical Society of Ireland. The following gentlemen were elected members: Rev. John Jebb, D.D., Rector of Peterstow, Prebendary and Precentor of Hereford Cathedral; John E. Hassell, Esq., Gowran Castle; Edward Hunt, Esq., Belmore, Thomastown; Very Rev. James Byrne, ex-F.T C.D., Dean of Clonfert and Rector of Cappagh; Dr. Chas. Lyster, William-street, Kilkenny; Dr. J. B. Fitzsimons, High-street, Kilkenny; Rev. J. Henderson, A.B., Silver-hill, Enniskillen; Rev. R. Archer Ffennell, Glebe House, Ballyboy; and James Kiernan, Esq., M.D. Enniskillen.

A medical writer wonders that travellers do not carry with them a little bottle of permanganate of potass, a few drops of which would speedily purify any water. A gentleman who has just returned from India states that he has derived the greatest benefit from its employment. In cases where the water was turbid, and tasting and smelling of decaying organic matter, the addition of a few drops of the solution of the permanganate made it, in a few minutes, as clear and as sweet as spring water.

We have seen a few of the wonders performed by the Genius of circumlocution. We have seen, for instance, a sheet of foolscap which had to be filled with signatures, before it became a sufficient authority to compel an official to pay an account of 6s. We have heard of the existence of a report of 26 pages on the alarming fact of a tenpenny nail having been found without a head in a government dockyard. These, however, are as nothing compared with the latest achievement recorded, and for the truth of which a Sunderland paper is responsible. A lock was wanted on the door of some premises in Sunderland, under the control of the Admiralty. The resident official thereupon applied to their Lordships, at Somerset House, for the requisite order to buy the lock, which was to cost 2s. Four or five sheets of folio inquiries were forwarded to him, which he had to fill up and return. Next came a gentleman from Tynemouth, to "survey" the hole in the door where the lock was to be put. Of course, he came and went first-class, and his fare and expenses doubtless amounted to a good round sum. His report was then forwarded to London, and at last down came the requisite order to Sunderland, authorizing the lock to be bought, and placed on the door.

The first meeting of the year of the Leicestershire Architectural and Archæological Society was held in the Guildhall, Leicester, last week, the Rev. J. H. Hill presiding. Proposed plans and elevations for the restoration of the church of Welham, by Messrs. Goddard and Son, architects, Leicester, were produced and approved. It was resolved that the annual summer meeting of the Society should be held at Kibworth on the last Monday of March next. The Rev. J. H. Hill exhibited two coins found near the Roman camp, at Hallaton, and the same gentleman read the Notes on the Prebendaries of St. Margaret's, Leicester.

"A Competitor" writes us to say that Mr. Smith's plans for St. Andrew's Church, Hertford, were never submitted to the committee; and that it was without their sanction that they were publicly exhibited, or that the engravings were distributed. He says that "Mr. Smith's plans were more expensive than they could afford, and its style was disapproved of by a majority of those present."

We learn that the plans of Mr. Wilson W. Phipson, C.E., have been selected for the ventilation and warming of the Royal Albert Hall of Arts and Sciences, South Kensington. To give an idea of the magnitude of this building, the heating apparatus for the hall alone will be composed of more than 27,000 feet of 4in. hot water pipe, arranged in coils under the arena, galleries, and lower corridor, the fresh air from the outside being distributed amongst them by means of two pans 6ft. in diameter.

The annual soiree given by Mr. William Higgs, builder, of South Lambeth, to his workmen came off on Friday last. About 500 workmen, with their wives and children, assembled in the Crown Works at Lawn-lane, under the presidency of their generous employer. After being regaled with tea and cake, Mr. Higgs, Mr. Spurgeon, and other gentlemen, delivered short addresses to the company on the benefits of such reunions, and their importance as a means of promoting that good feeling and right understanding which are at all times desirable and indeed necessary between employer and employed.

The efforts which were made a few years ago to re-organize the Kidderminster School of Art are now being rewarded by satisfactory results. The annual meeting was held on Friday last. The report read was very satisfactory in every respect, and a long list of prizes was distributed. Votes of thanks were passed to the vicar and mayor for presiding, to Mr. Harvey, the secretary, and to Mr. Kennedy, the able art master. An exhibition of the students' work was open in an adjoining room, and attracted considerable attention after the close of the meeting.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

1548 G. HOWARD. IMPROVEMENTS IN THE CONSTRUCTION OF PARQUET FLOORING. Dated May 24, 1867.

This invention consists in forming the foundation, or backing the parquet or ornamental surface of the floor, of any convenient or suitable number of layers of wood, arranged and combined as described. Patent completed.

1560 H. B. BARLOW. IMPROVEMENTS IN APPARATUS FOR COUPLING PIPES. (A communication.) Dated May 27, 1867.

This improved apparatus is applicable in coupling steam, gas, water, and other pipes, having a socket at one end into which the end of another pipe fits. This apparatus consists of four, or other convenient number, of segments, connected together by a hoop; one end of the segments is recessed to fit on the socket of the pipes to be coupled, and to the inside of each segment is screwed a thin steel blade, and these blades are surrounded by a ring or hoop of india-rubber or other packing. The apparatus having been placed on the socket of the pipe, the end of the pipe to be coupled is forced within the blades of steel, thereby expanding them and the packing ring inside the socket; the hoop is then knocked off the segments, and the segments with the blades of steel are drawn out of the socket, leaving the packing ring in its place. By this apparatus pipes can be coupled very expeditiously, and the packing ring is sure to be left in its proper place within the socket.—Patent completed.

1569 H. PETHER. PRODUCING BY A NEW METHOD ORNAMENTAL BRICKS FOR BUILDING PURPOSES. Dated May 28, 1867.

This invention refers to a means of imparting to the faces of bricks a diaper or ornamental pattern, by the following means:—Upon a metallic table is affixed a vertical frame, the inner edges of which are prepared to receive and guide an ascending and descending horizontal frame, which, acting on wedges attached to the sides of a metallic box hinged and secured at the bottom, causes the same to collapse when this horizontal frame ascends, and resume their open or spread position on its descent. Into this box is placed in a firm state the clay intended to form the brick.—Patent completed.

1613 E. J. DEMANET. AN APPARATUS FOR THE PURPOSE OF GIVING SUFFICIENT DRAUGHT TO ANY KIND OF CHIMNEY. Dated May 31, 1867.

This apparatus consists of a square or other shaped chimney or body made of metal or other material, and surmounted by a cap formed of two vertical sides joined by an arched top, the cap being open at the ends. The said two sides are longer than the diameter of the chimney, and thus project beyond its exterior surface. One of the said vertical sides is curved concentric with the chimney, while the other vertical side is half straight and half curved eccentric to the chimney. The cap may have an opening in the top covered by an inclined plate to keep out the rain.—Patent abandoned.

1598 A. V. NEWTON. AN IMPROVED METHOD OF PRODUCING MOSAIC VENEERS. (A communication.) Dated May 29, 1867.

This invention relates to the production of mosaic veneers or surfaces in an economical and expeditious manner, and consists, first, in forming prismatoidal rods of suitable form and colour for producing, when put together side by side, a surface with the required design, by forcing through apertures of the form of the cross section of the intended rods a plastic material, which, after the rods have been formed, will become, or which may be rendered, of sufficient hardness to be used as a veneer. And, second, in uniting such strips so formed into blocks, the cross section of which will be of the form of the surface to be veneered, or of a section thereof. Patent completed.

1639 S. HARWOOD. IMPROVEMENTS IN THE CONSTRUCTION OF WALLS, BUILDINGS, AND OTHER SIMILAR STRUCTURES. Dated June 3, 1867.

This invention relates to certain improvements in the construction of walls, buildings, and other such structures composed of layers of blocks or slabs of material in the nature of cement compositions, whereby complete ventilation is effected, and great strength afforded to the structure, with a less weight and quantity of material than has hitherto been the case. The inventor proposes to form the blocks or slabs by means of moulds, the materials consisting of concrete, pure Portland cement, Roman cement, or any other cement or lime, or lime and cement, or other known compounds suitable for the manufacture of hard and durable blocks of artificial stone, and to build the wall or other structure of a hollow or cellular form by placing or laying the blocks or slabs in courses side by side with a space or interval between the rows, which may be two, three, or other number, and by binding the courses with similar blocks or slabs, either touching each other or with a space between each—Patent abandoned.

1642 M. CAVANAGH. IMPROVEMENTS IN ADJUSTABLE LOCK SPINDLES. Dated June 4, 1867.

This invention has for its object improvements in lock spindles with a view of rendering the several parts thereof more complete and suitable for being applied and accurately adjusted to any thickness of door, and consist in employing with the ordinary tapped square spindle a regulating swivel screw nut, and sliding boss or nozzle, in combination with fixing studs and coupling socket turning upon the mount of the moveable knob or handle, by the arrangement of which, on the said spindle being adjusted to the required thickness of door, through the medium of the swivel nut, the said studs on the boss are caused to take into a notched concentric inner groove in the said coupling socket, whereby the knob or handle is firmly held or retained upon the spindle, in like manner to the bayonet fastening.—Patent completed.

1648 J. M'OWEN. IMPROVEMENTS IN FIRE-GRATES. Dated June 6, 1867.

In house fire-grates of the usual construction there is a grate on which the fire rests, and through which the ashes drop. Now, the nature of this invention consists in the application and use of two grates, the top one of which is a fire-grate for the fire to rest upon, and the bottom one is a coarse grate, and between or under the grates the patentee places a sliding valve which can be opened or closed at pleasure. By these means more or less air can be supplied to the fire by opening or closing this valve.—Patent completed.

1701 R. LOGAN. IMPROVEMENTS IN SECURING AND ADJUSTING WINDOWS, BLINDS AND SHADES, DOORS AND SHUTTERS, AND IN THE APPARATUS EMPLOYED THEREFOR. Dated June 13, 1867.

This invention relates to the regulation of the opening of blinds, and consists in employing one or more racks having ratchet teeth on them, which racks are attached to some convenient part of the framing. The moveable part of the window blind, shade, shutter, or door has one or more ratchet palls fixed to it, and which is or are acted upon by a spring, and by it forced into the recesses of the teeth.—Patent completed.

1732 J. HOLMES. AN IMPROVED COMBINATION OF MATERIALS TO BE USED IN THE MANUFACTURE OF DRAIN-BOTTOMS, FLUE SLABS, BRICKS, AND OTHER LIKE PURPOSES. Dated June 13, 1867.

This invention consists in the admixture of the scale or shale found in clay beds underneath the clay with the clay itself, or the admixture of the scale or shale with the "seat" found underneath coal in its bed as well as with the clay, by preference in the proportion of five-sixths of the former to one-sixth of the latter, the scale or shale having previously been pulverized and mixed with water to render it of a pasty consistency, and then blended or mixed with the clay, moulded to the required shape, and burnt in the customary manner.—Patent completed.

Trade News.

TENDERS.

ERRATUM.—In last week's tender for alteration of houses in Strand and Adam-street, for "quantities supplied by Mr. T. Begg," read "Mr. W. G. E. Baggs."

BRIERLEY.—The tender of Mr. Ridal, of Sheffield, for a new church at Brierley, near Cudworth, has been accepted. Mr. J. S Foljambe, of Osberton, has presented the site, together with £1,000 towards the building, besides providing for the endowment.

FALLOWFIELD.—For the erection of new schools at Fallowfield, near Manchester. Mr. Ernest Bates, of London, and Manchester, architect. Quantities supplied.

Robinson and Son	£1,130
Ward and Co.	1,120
Porteous	1,100
Quillish	1,060
Thornton	1,055
Grimshaw and Co.	1,040
Meadows	1,027
Brown	1,005
Barber and Gibson (accepted)	1,000

HORNCASTLE.—For Mr. Johnson's new buildings in the Market Place:—

Hobson and Co.	£3,380
Close and Co.	3,360
Otter and Co.	3,201
Walter	3,150
Sherwin	2,995
Huddleston	2,850
Bellamy and Jay	2,740
Thompson (accepted)	2,599

KETTERING.—For residence at Kettering, Mr. R. W Johnson, architect, Melton Mowbray, and Leicester:—

Hawthorn	£1,289
Henson	1,277
Barlow and Bullin	1,202
Wilson	1,197

MAY FAIR.—For alterations and reinstatements at No. 5, Shepherds Market, May Fair. Mr. Charles Innes, architect.

M'Lachlan	£464 0 0
Wilcox	429 0 0
Preedy and Son	416 0 0
Thomas and Son	405 0 0
Snowden	398 0 0
Fish	394 0 0
Henderson and Cairns	393 0 0
Sapnell	388 19 0
Nightingale	382 0 0
Perkins	377 0 0

LONDON.—For schools at Vauxhall, by the Rev. George Herbert, Mr. J. T. Knowles, architect. Quantities by Mr. H. F. Oritton:—

Longmire and Burge	£2,897
Holland and Hannan	2,781
Mansfield and Price	2,700
Trollope and Sons	2,634
Colls and Son	2,630

PECKHAM.—For a factory and stables in Peckham Grove, Camberwell, for Mr. Jones. Mr. Coe, architect. Quantities supplied.

Larke	£785
King and Sons	760
Batchelor	739
Johnson	719
Shapley and Webster	673
Smith	658
Mortar	654

TWYWELL.—For house at Twywell, Northants. Mr. R. Johnson, architect, Melton and Leicester.

Wilson	£436 10 0
Barlow	434 12 0
J. Henson	433 0 0
W. Henson	427 10 0
Gunn	420 0 0
Coutts and Fletcher	419 17 10

PROPERTY SALES.

JAN. 30.

AT THE MART.—By Messrs. Chinnock, Galsworthy, and Chinnock.—Leasehold residence, No. 23, Kensington-crescent West, let at £51 per annum, term 99 years from Lady-day, 1822, at £10 10s. per annum—sold for £420.

Leasehold, two houses and shops, Nos. 113 and 114, Great Dover-street, Southwark, and premises in the rear, being Nos. 10 and 11, Eltham-place, and let on lease at £60 per annum, also a ground rent of £5 per annum arising from No. 9, Eltham-place aforesaid, term 70 years from 1821, at £16 per annum—sold for £520.

Leasehold house, No. 13, West Smithfield, let on lease at £140 per annum, also leasehold premises in the rear, known as the Greyhound Inn-yard, consisting of warehouses, stabling, and other premises, let on lease at £140 per annum, term 51 years from Lady-Day, 1832, at £170 12s. per annum—sold for £800.

By Mr. John Dean.—Leasehold 18 houses, Nos. 8 to 25, Three Mill-lane, Bromley, producing £257 8s. per annum, term 99 years from 1858, at £45 per annum—sold for £1,600

By Mr. Thos. Dracott.—Leasehold two residences, Nos. 7 and 3, Rosemount, Wallington, Surrey, estimated value £105 per annum, term 99 years from 1863, at £10 10s. per annum—sold for £510.

AT THE GUILDHALL COFFEE-HOUSE.—By Messrs. Farber and Price.—Freehold five houses, two with shops, Nos. 2 to 6, King street, Soho, producing £164 per annum—sold for £3,000.

Freehold house and shop, No 3, Moore-lane, Soho, let on lease at £50 per annum—sold for £1,140.

Freehold ground rent of £27 per annum, arising from the New Thirteen Cantons public-house, No. 9, King street. Soho, and a house, No. 8, King-street—sold for £670.

Leasehold house and shop, No. 98, Great Tichfield-street, Marylebone, let at £60 per annum, term will expire on October 11, 1887, at £8 per annum—sold for £520.

Leasehold residence, No. 7, Warwick-gardens, Kensington, let at £65 per annum, term 70½ years unexpired, at £8 per annum—sold for £740.

Leasehold residence, No 9, Warwick-gardens, let at £60 per annum, term and ground rent similar to above—sold for £970.

Leasehold residence, No, 12, Lowther-cottages, Holloway, let at £47 per annum, term 66½ years unexpired at £6 per annum—sold for £450.

Leasehold two residences, Nos. 77 and 79, Bridge road, Hammersmith, producing £65 per annum, term 61¼ years unexpired, at £10 per annum—sold for £850.

Freehold ground rent of £13 per annum, arising from Nos. 1 to 4, Chapel-street, Hammersmith—sold for £280.

Freehold house, No. 2, Bentinck-street, Soho, let at £55 per annum—sold for £850.

Freehold residence, No. 21, Savile-row, Regent-street, let at £85 per annum—sold for £1,620.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

James Buck, East Dulwich, carpenter, February 12, at 12—Francis Davy, St. Paul's Street, New North Road, builder, February 13, at 12—Samuel Reeve, Greenwich, plumber, February 12, at 11—William Sherwin, Hounslow, stonemason, February 17, at 2—William Henry Soar, Vauxhall Bridge Road, plumber, February 13, at 3—Charles Barry, Christchurch, Hants, plumber, February 17, at 12—Robert Deeks, Joshua Street, Bromley, Middlesex, builder, February 19, at 2—Woodward Dudley, Naylor Road, Peckham, painter, and glazier, February 20, at 2—John Ingafill, Knockholt, Kent, builder, February 25, at 12—John Wilston, Great College Street, Camden Town, contractor, February 17, at 11.

TO SURRENDER IN THE COUNTRY.

Edward Cowin, Hulme, joiner, February 19, at 11—John Parry Edwards, Holyhead, contractor, February 14, at 12—John Morgan, Defynnock, carpenter, February 18, at 2—Charles Rolfe, Llanberis, civil engineer, February 17, at 12—Henry Sargeant, Portsmouth, plumber, February 15, at 12—John Thomson, Monkwearmouth Shore, builder, February 19, at 12—William Aston, Brighton le Sands, Lancashire, builder, February 14, at 11—Thomas Barrowclough, Sheffield, joiner, February 12, at 1—Thomas Crage, Weston super Mare, carpenter, February 14, at 11—William Kerslake, Exeter, painter, February 11, at 11—Frederick Lloyd, Bristol, carpenter, February 21, at 12—John Oldham, junr., and Adam Grange Bell, Lancashire, builders, February 13, at 10.

THE BUILDING NEWS.

LONDON, FRIDAY, FEBRUARY 14, 1868.

ART IN THE THEATRES.

IT is just possible that some one may dispute the existence of art in the theatres, and, if the objector should appeal to facts in support of this counter-proposition, it is more than probable that we should be very hard pressed to sustain our hypothesis. Art, in its true and highest sense, is scarcely to be found on any stage in this country, and perhaps in no other. There is plenty of artifice and a great deal of cleverness, but not much, if anything, that is worthy of the name of art. Mr. Charles Mathews is irresistibly droll, Mr. Sothern dry and comic, Mr. Buckstone funny, and Mr. J. Toole humorous, but it is almost an act of courtesy to call these men artists; while Mr. Phelps, Mr. Fechter, Mr. Boucicault, and others of the more serious school of performers, are even less entitled to rank as artists than the comedy men. Actresses are little or no better. Miss E. Farren, at the Olympic, is the only possessor of a genuine vein of humour, and, notwithstanding the fact that several ladies draw full houses and receive favourable notices from the so-called critics, there is not one who we can unreservedly rank as a true artiste. This is a sweeping assertion, but it is the result of long and careful inquiry; an opinion expressed in a few hurried sentences, but formed gradually and cautiously, in the course of many long and tedious hours spent wearily waiting for a vision of art in the theatres of London and the provinces.

So much for the acting. Unhappily the spectacular portion of our stage performances is not one whit better. Actors and actresses pose themselves with immense purpose. Mr. Fechter is great in facial expression, and bestows wondrous attention on his eyes and mouth; Mr. Phelps, sen., trembles terribly, clutches his hands, and heaves his chest with great ardour whenever an opportunity offers, and not unfrequently when it does not; and Mr. Phelps, jun., disposes the limbs of his Adonis-like figure with infinite grace, baffled only by his hands. The managers of the various theatres parade their utility people and supers with commendable zeal, and, despite the most manifest failures, strive to group them with picturesque effect. Costumiers lavish cloth and colour with a profuse hand, and scene-painters cover gigantic surfaces with the semblances of earth, air, fire, and everything, while stage-carpenters and machinists perform miracles of marvellous intricacy. Nevertheless our stage spectacles are, with here and there a solitary exception, simply atrocious. The result of this state of things is that artists and lovers of art have almost deserted the theatres, and when they do visit one of these establishments generally find their sense of the beautiful and the true grievously offended and strangely scandalized.

Close and accurate criticism of the drama would be a novelty in the metropolis, and might, in the end, work some good and lasting improvement. One share of the work, at least, falls within our province. The setting of pieces—that is, the manner in which they are put on the stage—is a topic which we may treat with some confidence, and we are certainly not indisposed to lend a helping hand. However, our present purpose is limited to a proof of the necessity which exists for a better censorship. Not long since, at Drury Lane, in the "Great City," the world was favoured with a realistic view of Waterloo-bridge, so good, so true, and so thoroughly artistic, that the live horse in the real Hansom, which was to bear away the heroine and her would-be seducer, had to wait patiently on the Strand side of the river, rubbing his nose against the houses on the other side of the water, and the people who paid their halfpennies and passed the toll-gates had to turn off and disappear mysteriously over or under the parapet, because the scene-painter had set his bridge end on, instead of obliquely, before the audience, and so spoilt the whole effect. Nevertheless the scene was considered such a paragon of beauty and truth that it was placarded and paraded all over London as though it were of unparalleled excellence. This is only one out of a multitude of similar examples of wrong doing, by which the cause of art progress suffers loss, and the taste of the people is corrupted. At the Adelphi it has long been the practice to use the oldest and most hideous scenes which an audience can be induced to tolerate. At the Olympic matters are little if at all better arranged. At the Princess's they go in for superior scenery, but seldom evince any great taste or art knowledge. The Holborn has produced some of the most ludicrous and puerile scenery and mechanism which has appeared in the metropolis; while even at the New Queen's, where it might have been hoped that some small attention would be paid to art principles, the horrible and effete system of working by flats is being reproduced, even at considerable inconvenience. In short, it must be evident to every intelligent observer that the manner in which pieces are set on the stage is simply discreditable. Hence the necessity for discriminating and honest criticism.

The setting of a drama, as far as scenery and spectacles are concerned, is of the first importance. Many people fail to see this. They do not recognize the purpose of a scenic representation, and missing this point attach little weight to its truth or harmony. It is curious to note the mistakes which even intelligent and thoughtful people make in the matter of stage spectacles. In the "Echoes of the Clubs," a periodical which professes to meet the requirements of high-class and cultivated readers, a series of papers has been this week commenced on the subject of stage costume. The topic of the first lucubration is "Blunders of the Past." Would it be believed the author entirely ignores the fundamental question whether or not a play should be performed by actors and actresses attired in the costume of the supposititious dramatic epoch or in that of the day, and, leaving this point undetermined, proceeds to abuse the managers who, some fifty years ago, dressed their characters in the garments worn by their contemporaries. It is needless to point out that the astute critic is blundering even more seriously than his victims could possibly have done. The choice of a period by the costumier is one thing; the fidelity with which he reproduces the costume of the period chosen is another. It was to this last topic that the critic should have directed his attention. What he calls the blunders of the past are not blunders. It was always open to the manager of a theatre to choose his period; and, if he elected to dress his people in the costume commonly worn by the men and women around him, he virtually turned the whole performance into an undressed charade, and he was fully entitled to do so without being convicted of a blunder. But this by the way, and only to show how false are premises on which able men reason in their criticisms. There can be no doubt but that it is open to a manager to produce a drama without scenic accessories; but, if he sets it on the stage with the aid of scenery and spectacles, these must be beautiful and no less true. Art principles should govern the whole process of production, and be allowed to determine every detail. Then, and then only, will the setting of a piece be correct chronologically, pictorially, and as a work of real and harmonious art. When the manager's business is transacted on this principle there will be art in the theatres, and not before. Meantime, Mr. Benjamin Webster and Mr. Sefton Parry may chuckle over the amiable gullibility of the play-going public; and Miss Marie Wilton take full credit for the fact that the Prince of Wales's Theatre is almost, if not quite, the only house in London where things are done decently and in something like order.

AID TO ART TEACHING.

IT is satisfactory to be able to note that the great question of technical education is at length beginning to assume a definite form, and to take a practical turn as regards State aid. A new minute setting forth certain provisions which Government are now prepared to make for the aid and encouragement of art schools has been sanctioned. The Government announce that they will give a payment of £3 a-year to the Committee of the Science and Art Department for every artizan who shall submit satisfactory examples of his work, and be recommended by the local committee for a free studentship. This studentship will admit the student to the art school, without payment of any fee for twelve months, and the scholarship may be renewed if the student continue to attend regularly the instruction given in the art school. It provides, in fact, for the free art education of artizans who are willing to work. An additional payment of £5 is also to be made for an art pupil teacher in schools where twenty artizans are receiving art instruction, and in schools where there are fifty artizans and upwards, two pupil teachers will be allowed, so that the payments in future will be either £15 or £30. A proportional payment will be made on the works of artizans which do not come up to the requirements necessary for the full payments of 15s. or 20s. To the head masters of schools of art, where the results and general working are satisfactory, a bonus of £50 will be paid to one master, a sum of £40 each to three masters, £30 each to five masters, £20 each to ten masters, and £10 each to twenty masters. Thus, thirty-nine masters will receive direct payment, provided the schools are in a condition to justify the expenditure. In future, also, the committees of art schools, night classes, and elementary schools will be able to provide themselves with approved examples at a reduction of 75 per cent., and in special cases, where buildings or rooms are permanently devoted to instruction in art, this aid will be extended to provide the necessary apparatus and fittings. This provision is made in order to remove the complaint that the department has not hitherto given sufficient aid towards the purchase of examples. These are the leading features of the new minute. The terms offered are fairly liberal, and local effort and co-operation must determine to what extent they are appreciated.

NEW BUILDINGS IN LIVERPOOL.*

MR. G. E. GRAYSON, who some little time since built a very dignified and palatial-looking block of offices in the Italian style in James-street, has, with true modern eclecticism, faced about, and is going in "heavily," in more senses than one, for Gothic. In Redcross-buildings, now in progress from his designs, there is exhibited a good deal of originality, but accompanied by a good deal of that exaggerated heaviness which characterizes so much of the current Gothic style, especially in the wide spread of the capitals and the disproportion between the small circular shafts and the heavy cubical blocks of masonry which they appear to carry, which in this case amounts to caricature. There is a great deal of clever and effective carving, of the Early French type, about the building; but the placing of dragons and griffins as dripstone terminations is really an absurdity in a modern building for business purposes. The mullions dividing the second

* Continued from page 91.

floor windows have little more than the thickness, and very much of the form and treatment, which would most naturally be given to an iron standard; and, though evidently very carefully built (of brick with stone head and base), *look* far too weak to be satisfactory to the eye. Old Castle-buildings, by the same hand, is another grim and heavy structure, with trefoil-headed windows and a good deal of rather commonplace ornament in the shape of incised circles and lozenges and notching. A very disagreeable effect is produced by some of the pointed windows being so extravagantly stilted, the spring of the arch being about two feet above the cap of the shaft which carries it. We may notice this building, however, as one of the few instances (we think the only one in this part of the town) of anything like picturesqueness of masonry, which in this case is in irregular coursed work scutched, which, we cannot help thinking, if more used, would give greater life to the masses of wall flanking the streets than the rubbed or tooled ashlar with which the new buildings are mostly constructed, and at less expense.

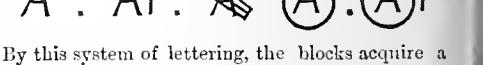
The Alliance Bank, erecting at the corner of Castle-street from the designs of Messrs. Lucy and Littler, scarcely bears out the local reputation which the architects have justly gained from some of their works on the Birkenhead side of the Mersey. It may not be fair to judge of a half-finished building; but the projections and sinkings of the panels and other ornament and mouldings seem singularly flat and ineffective, the ground floor windows (we suppose of the bank) are very tall and narrow, and, though the principal entrance, which is evidently to be the leading feature of the building, shows some bold treatment in the large corbels carrying the balcony over, it is in some degree marred by the ragged-looking naturalistic foliage with which the panels over the door are filled in. A better building, on the whole, is Messrs. Picton and Co.'s North-Western Bank, in spite of the odd "wheel" ornament which forms the finial to it. The bank storey, in rusticated granite, is well emphasized, and there is some very satisfactory and elegant detail in the upper portions. On turning down Lord-street, our attention is attracted by a large block of shops nearly completed from the designs of Mr. H. H. Vale, and in a style that may be called Gothicised Italian. The whole front is of stone very solidly built, and with good deep reveals to the windows; rusticated granite piers being left between each shop window, not so wide or massive as could be wished, but praiseworthy as a protest against the almost universal practice in Liverpool of building shops so as to have the appearance of standing entirely on glass. All the carved ornament is of a quasi-Gothic character, and is for the most part bold and effective, except that the abacus of each capital is too thin and weak; and there is a certain lack of refinement in the details and of unity in the whole design; but, altogether, the building is no doubt a step forward in shop architecture. Of course *the* new shop is Compton House in Church-street, built under the direction of Messrs. Haigh and Co., the contractors (who "keep an architect"). The general aspect of the Church-street front, with its tower, crowned by a high roof at each end, is really very imposing, and the effect of the simply designed first floor windows with their very deep reveals is admirable. But, unhappily, in this large and important building, the old mistake has been made of sacrificing everything in the ground storey to plate-glass, and the whole of the massive stone superstructure is carried on iron columns as carefully concealed as possible in the rear of the window frames. Nor will the details bear close examination—the carving wants sharpness and shadow; the surface decoration upon the alternate quoins of the rusticated pilasters looks like confectionery or "pie-crust" ornament; and the carving under the corbels which support the little oriels at the angles is excessively weak, and has not the slightest appearance of strengthening or supporting the work above it—it is a mere excrescence in fact, while the overhanging of the angle of the main building above the oriels is most unsatisfactory in effect, and when viewed obliquely is positively painful to the eye. It is a pity that such a fine opportunity should not have been made use of to produce a building which might have been pleasing from its refinement of detail and breadth of style, instead of being effective merely from its size and richness of ornament, some of which latter is decidedly "shoppy."

The new public offices in Dale-street are now partially occupied; and the tower, under the auspices of the borough architect, Mr. Robson, has got into the spire stage. That this building has been much improved by getting into Mr. Robson's hands before it was half-way up we have little doubt, especially with regard to the ornamental detail, most of which is very effective and clever, and characterized by great depth of shadow; and the capitals of the columns which form part of the face of the building present some very good and original treatment, the regulation classic outline of the capitals being formed by leaves and details more in the Gothic manner, introducing conventional representations of the fern and other leaves, and each one differing in design, though this diversity is rather overdone, and should, we think, only be carried so far as to be apparent on a close inspection, leaving the general effect, when viewed from a little distance, the same, otherwise a patchy effect is introduced into the building. We presume it is not the fault of the present architect that the stale device of semi-detached columns running up the walls between each window encumbers the building, but he is responsible for the unsatisfactory manner in which the main cornice (over which is a large attic) breaks round each column, so as to leave a broad expanse on the top of the cornice, at the back of which stands a statue occupying far less area than the column below, a great part of which is thus supporting nothing. For the tower also the present architect is responsible, and we confess it pleases us not, so far. We like to see a large tower with a broad and comprehensive design binding together the whole of it as one great feature; but here we have a congeries of small parts—pilasters, panels, and projecting balconies—with no one motive predominating over the rest; and the balustrade surrounding the smaller portion which forms the clock chamber (and from which springs the spire—square on plan) is finished at each angle with a most ugly stumpy pinnacle with large coarse crockets upon it; while from the four corners of the clock chamber project lean, long, and hideous gargoyles of the most mediæval description. There is elegance in parts of the tower, but an entire absence of power in it, taken as a whole. The interior of the building calls for little remark, save that the staircases and passages have that look of cold bareness and gloom which seems proper in official buildings of this class. And here we close our notes for the present.

TERRA COTTA, AND ITS EMPLOYMENT AS A LONDON BUILDING MATERIAL.*

As fitness should be of primary importance in the employment of architectural materials, we may look at the size of our blocks in this light. We want a size which shall admit of easy handling in the manufacture, of thorough firing or admission of the heat of the kiln to all parts of the material, and which, when the blocks have been placed in position, shall distinguish the work at once from stone and brick. Nothing is more hateful than to imitate or counterfeit one material in another, therefore I repeat we must select proportions for terra cotta which avoid the massiveness of stone and the pettyness of brickwork. This size, then, should be in cubes of from one foot to eighteen inches. I am convinced that the dimensions just given are the utmost which can be favourably advocated for terra cotta which has to be much fired. Beyond this limit the blocks twist and sag in drying, and the long lines of mouldings are, when put together, uneven and defective, and the labour of production to the manufacturer is also, as I shall point out later, materially increased.

I shall, then, assume the average size of my blocks for the contemplated building to be one foot cube, and should proceed to space them out as shown in this diagram, endeavouring, as far as possible, to avoid multiplicity of pattern, and to preserve a symmetrical disposition of the blocks. I may here mention the great importance of accuracy in the drawings for terra cotta work, on which depends one of the distinguishing points of this material as compared with stone—namely, that any error in the dimension of stonework may be rectified in a day or two, whereas a falsely calculated or constructed terra cotta block not only renders it useless for the building for which it was designed, but imposes also a delay of from eight to ten weeks, which must elapse before it can be replaced. The seriousness of such an occurrence as this justifies me in impressing upon you the necessity of more than ordinary care in the preparation of the terra cotta drawings. In order to fit the blocks properly in their relative positions and to distinguish the courses from one another, I have found it advisable to mark all the blocks of one course with the same letter, peculiarizing the different patterns of blocks in that course by means of numerals, the external mitre with a cross, and the internal ones with a circle round the letter, thus—



By this system of lettering, the blocks acquire a sort of individuality, and a ready means of communication with the manufacturers and contractors, and of reference to the drawings and models, is secured. The one-eighth full size drawings being ready, and the shrinkage scale having been prepared, the next step is to make full size drawings for the plasterer or the manufacturer from which to construct his models. These drawings must, of course, give the plan, elevation, and section of each block; and I have been accustomed (on account of their size and numbers) to make them on thick lining paper, and to trace them on thin common lining paper, which I was fortunate enough to discover is sufficiently transparent for this purpose. I need not say much with reference to the plaster blocks or models. I have found it convenient to run the simple enriched mouldings, dentils, beads, &c., the full projection in the plaster, and to carve out the enrichments subsequently. For the more complicated enrichments spaces must be left in the plaster for the insertion of modelling clay. Before quitting the subject of the models, it will be as well to state that it is usual for the architect to send the large detail drawings to the manufacturers, who prepare the plaster model. The enrichments are then carved upon it or added in clay, under the superintendence of the architect, and the model is returned to the manufacturer to make his moulds and to carry out the work. This is, at the best, a roundabout process, and for large works I have found it desirable to employ a plasterer on the spot, and have the blocks made on the works, and sent when completed to the manufacturer, the cost of the plasterer's time and material being deducted from the terra cotta account, as the price named in the tender of course includes (unless otherwise specified) the formation of the first models in plaster.

With regard to designing ornament for terra cotta work, I need only say that the material in which the design is wrought is so perfectly adapted to the skill of the modeller, that we may expect the highest efforts of the sculptor's art—in cases where only a few copies of the work are needed they may be actually modelled in the clay which is to be burnt, and we have the artist's own handiwork. When many copies are wanted, with good moulds, and workmen who know how to let the clay alone after it leaves these moulds, we may expect a very near approach to the sculptor's own work, much more so than in stone-carving, where a weak resemblance to the model is obtained in a material whose qualities and methods of working are so essentially different from the sculptor's clay, that a sort of education in the art of interpreting modelling into stone-

* Read before the Architectural Association, 9, Conduit-street, on Friday, January 31, 1868, by Gilbert R. Redgrave, and continued from page 93

work is all important to the stone carver. The motto for the terra cotta modeller should be—"Work in low relief and avoid undercutting."

MANUFACTURING TERRA COTTA BLOCKS.

The clay from which the best white terra cotta is prepared is that which is found alternating with shale in the coal measures, and we have here at once a key as to where and how to procure cheap and good terra cotta—viz., where the coal to fire it is found in connection with the clay from which it is made. Manufacturers who have to procure their clay from one place and their coal from another, cannot now, and I fear never will, be able to compete with those who have coal and clay on their own premises, or in their own immediate neighbourhood.

The clay, as it comes up from the coal fire, is generally very stiff and solid, from the great pressure to which it has been subjected. To prepare it for manufacture it requires to be broken up and ground, and for good work those portions are selected which are most free from shale and extraneous matter. The clay is forced into the moulds by hand, and thoroughly squeezed into all the crevices. The mould, I should tell you, is formed in pieces, and is made of coarse plaster—as it is from 1½in. to 3in. in thickness, it becomes for large blocks a very bulky and unmanageable concern. The mould is open, of course, on one side, and from it is scooped out the substance or interior of the future block. This open side should be at the back, or part opposite to the face, as, if the terra cotta is hollowed on the bed or the upper surface, the openings are liable to interfere with the placing or fixing of the blocks under or above it. Cell walls are left in the interior to support the clay in drying, and to augment the strength of the block, the thickness of the clay being reduced as nearly as possible to an uniform standard throughout to secure the equality of the drying and firing of all parts of the material. Some manufacturers complete the block by filling in the hollow side, and providing merely a number of holes for the evaporation of the moisture, and for the sake of grouting; but I am convinced that this is a disadvantage, and that the open blocks are more certain to be well burnt, and can be better built in and bonded with the brickwork than the solid ones. The average thickness of the terra cotta may vary from 1in. to 1¼in., according to the size of the block. The clay remains in the mould about twenty-four hours, by which time it has shrunk away from the plaster, and, after the cords confining the sides or facets of the mould have been loosed, it is removed from the clay. The workman then finishes up the clay block, adding those parts which are incomplete and damaged, and smoothing the general surface of the materials.

It may be as well here to protest against the so-called finishing as is generally practised by manufacturers, who either spoil the whole surface of the clay and obliterate the finer touches of the modelling, by going over it with a sponge, or who introduce no end of fancy touches and original markings to conceal slovenliness in the moulding. There are, too, those who, at this stage of the manufacture, daub over the work with a wash of some horrid colouring material to make the finished block burn of a pretty pink or other approved tint. Blocks thus finished invariably lose their gay colours after a year's exposure to the weather, and the artificial surface formed by this painting operation lets in the frost in winter, and splits up into innumerable hair cracks. If terra cotta must have the creamy look which is aimed at by this process, it would be far better to give it a coat of distemper before leaving the manufactory (similar to the priming of joiner's work), the first shower would then get rid of the colouring matter without in any way damaging the terra cotta. The burning of the blocks is hardly a question of any moment to the architect. The clay stands from ten days to a fortnight (according to the season) to dry. It is then placed in the kiln and burnt with a steadily increasing heat for five or six days, after which the kiln is slowly cooled, and the finished blocks are taken out ready for use. The final colour of the terra cotta depends to a very great extent upon the intensity of the firing and the moisture or dryness of the clay before it is placed in the kiln.

I can give no certain data to determine from the colour the quality of the terra cotta, but I have frequently found that a pale bilious grey or very light yellow colour denotes insufficient firing, while a rich brimstone yellow or pink is a sign that the material has been burned to the utmost it will stand without vitrifying.

I have no time to tell you of the many dodges and mixtures which some manufacturers inflict upon their clay. Powdered terra cotta, called grog, is very commonly made use of in considerable quantities, for the sake partly of economy and partly to prevent excessive shrinkage when drying; but the use of it is attended with many evils, which I cannot dwell upon now. There can be no doubt that the purer the clay is the better will be the terra cotta.

We have now had a hasty glance at the clay in all the principal stages of preparation, and we will suppose the terra cotta to have been delivered upon the works. The blocks should be carefully fitted together on a floor or even surface to check their aggregate lengths, to try them as to squareness, and to ascertain how they fit to one another. Small inaccuracies may be remedied by rubbing down the edges on a stone (no easy matter by-the-bye with good terra cotta), and for important errors the blocks have to be clipped down with the chisel—this is a dangerous and difficult proceeding, and should be resorted to only as a last alternative. Insufficiency of length may be overcome by widening the joints. It is at this stage of the work that the advantage of keeping the blocks small in size is most manifest. Large blocks twist so much in many cases that it is absolutely necessary to cut and rub away the surface, and this is attended with the unsightly result I spoke of in the early part of my paper. Blocks up to 15in. in length are, as a general rule, very true, and it is only in the greater lengths where cutting becomes necessary. In fixing the terra cotta, care must be taken to fill in the hollows of those blocks which have to carry heavy weights, and the cement grouting with which this filling in is done must be mixed very poor, as I have known the expansion of the cement in setting to burst the terra cotta all to pieces. Eight parts of sand to one of good cement is strong enough for this purpose. The blocks themselves may be carefully bonded in with the brickwork in cement, in the proportion of three of sand to one of cement, the face joints being raked out, and pointed with a mixture of one part of powdered terra cotta to one part of lime.

I have prepared diagrams of some few cases of terra cotta construction, from which you will see that the use of iron is almost a matter of necessity. This I consider to be the only drawback to the extensive use of terra cotta in small blocks. I admit that it is quite possible in the cornice to carry the weight by means of York landings and large slabs of stone tied down by bolts in the usual way, but I incline to think that the construction with iron joists is the more preferable method of the two. In the case of columns, however, there is no choice but to use iron, unless we trust to the terra cotta by itself. Here it will be of interest to bring under your notice the only experiment I know of as to the resistance of terra cotta to compression.

STRENGTH OF TERRA COTTA.

The plan of the 1862 Exhibition was so arranged that the existing south arcade of the Royal Horticultural Society's Gardens might serve as the refreshment rooms, and form the ground floor of a lofty building, and it therefore became necessary to ascertain the amount or weight that the terra cotta columns of the arcade would sustain. In order to arrive at a fair conclusion, Captain Fowke resolved to have one of these columns tested, and the experiment was accordingly undertaken by the late Mr. Wakeford, the clerk of the works for the gardens. Unfortunately the ultimate results were not at all conclusive. Still they are, till others are obtained, of the utmost value. The column, which is in six pieces, including the Bath stone abacus, was put together in cement with plugs in the usual way, on a wooden support or base. It was then enclosed in a frame, the head of which consisted of two deals resting on the abacus and bolted edgeways to the uprights. The column was then crushed by lifting the wooden support on which it stood by means of the piston of a hydraulic ram. The fault of this arrangement was that the abacus, instead of bearing against one rigid body, was forced against the edges of two deals, and the weight was thus unfairly thrown on the cap, which splintered away gradually, and finally caused the fracture of the upper section of the column, with a load, at the moment of failure, of about eighteen tons. The weight of twenty and a half tons had, however, previously been sustained by it, and there can be no doubt that, but for the defect in the apparatus, it would have carried much more. The result I have just given, which is I believe much beneath the actual strength of terra cotta, is nevertheless quite sufficient to prove that this material may be entrusted with all ordinary loads. Indeed, I think that the column I have drawn in my diagram, which is 15ft. high, and 1ft. 6in. in diameter, would carry a weight of twenty-five tons with greater and more permanent safety than the cast-iron column or core, 8in. diameter and 1in. thick, which has been inverted to carry this load.

In all my remarks, where I have used the word terra cotta, I must be understood to refer to the yellow or grey variety. The qualities and properties of red terra cotta are so inferior and so different to the white, that I have not devoted much consideration to it. The clay from which it is made must, in order to produce a fine colour, be a mixture, or it can be but little fired. When pure clay is used, it must be burned with a far less heat than fire-clay, and the resulting terra cotta is consequently soft and wanting in durability. The Fareham brick earth would, I am convinced, be a splendid material for the production of red terra cotta, and I commend it to the notice of manufacturers. The ordinary red clay is a tertiary formation, and becomes, when hard burnt, the disagreeable colour we associate with flower-pots and drain-pipes; but it is possible, by mixing it, to produce terra cotta of a deep crimson hue. As you have already heard my objections to mixed clays, you will understand my reasons for mistrusting red terra cotta.

ADVANTAGES OF TERRA COTTA.

I must now say a few words with respect to the special advantages of the use of terra cotta in London. Mr. Matthews, in his able essay on the "Materials for London Exteriors," speaks in very favourable terms of the application of glazes, in various colours, to the surface of bricks, and looks forward to the time when such glazed bricks will be procurable at a cheap rate. Now, in terra cotta, we have a substance eminently adapted to receive a glaze, and enamelled terra cotta, the Della Robbia ware of the old Italian times, is, I hope, the material destined to beautify and decorate the London of the future. As Paris has become beautiful by its splendid stone, so smoky London will, by its durable (imperishable, I may almost say) and decorative majolica ware. In glazed terra cotta we have, I maintain, the panacea for all the evils which cause the failure or the ill success of our modern London architecture. Victorian architecture relies, to a very great extent, upon colour for its enrichment and for its effect. Up to the present time, the costly city banks, public buildings, and warehouses have, after a few short months of splendour, fallen a prey to soot. It is very humiliating to be obliged to confess this, but I am afraid that we must all admit that, with the solitary exception perhaps of polished granite, every material yet employed in London architecture succumbs, after a brief struggle, to fogs, smoke, and the London atmosphere. Now, I hold that in good terra cotta we have a material which defies our destructive climate, and which, while it answers all the requirements of the architect for building purposes, has also the merit of possessing in itself good rich colour, and of admitting of the application of a glaze of any desired tint. With such qualities as these it has a most brilliant future; and when, by a more extended demand, manufacturers have learnt to produce an article of uniform excellence, and at a cheap rate, there is no knowing how vast may be its employment in London. In that part of his essay which refers to terra cotta, Mr. Matthews adduces most of the arguments in favour of its use which I have already brought under your notice. He also mentions some buildings recently executed in London where terra cotta has been employed. One of his examples, the portico in Great Cumberland-street, is worthy of notice, on account of the small size of the blocks of which the entablature is composed. I cannot but think this to be a defect, and I may add that not only is the cost of the production of the terra cotta thereby increased, and the labour of construction augmented, but the architectural effect is also marred by the resemblance of the upper part to brickwork, which gives it an appearance of weakness and suggests the necessity of some visible arch-form or support. The green hue of some terra cotta, which Mr. Matthews points out as unpleasant, is due to its absorbing and retaining moisture, and is a sure sign of a bad material, as it proves it to have been it sufficiently burnt.

PRICES OF TERRA COTTA.

I shall conclude my paper with a glance at the present prices of terra cotta. Any architect who may happen to have made use of this material, and who has obtained tenders from various manu-

facturers, cannot fail to have been startled at the discrepancy which exists between the prices of the same article from producers in different parts of the country, a variation of 200 per cent. between the highest and lowest tenders being by no means uncommon; and this, alone, is a most convincing proof of the ignorance and uncertainty which prevails with reference to the subject under consideration. I may state, very roughly, that the average price of terra cotta in the neighbourhood of London is from 4s. to 8s. per foot cube, and in the coal districts of Staffordshire and the north it varies from 2s. 6d. to 5s. per foot cube. I feel certain that in a very few years terra cotta of excellent quality, made where coal and clay abound, will be sold in London at from 1s. 6d. to 2s. 6d. per foot, when a considerable number of the blocks of each pattern are required. This last proviso, however, is a very important one as regulating the price of terra cotta, for one of the principal expenses of the manufacture consists in the preparation of the model and the mould, and when only a small number of blocks is required from any given pattern the preliminary expenditure forms, when divided, a heavy item in the ultimate cost of each block. Terra cotta ornamental work contrasts very favourably with stone carving in point of price, the modelling being set down as the same in each case. We have, for stone, to allow a large sum for the labour of carving, while, for the terra cotta, the only labour consists in forcing the clay into the mould and placing it in the kiln. In the South Kensington Museum is an ornamental mullion carved in stone, and the same work executed in terra cotta; the relative prices were put down very accurately, and were as follows:—£5 8s. for the work in Portland stone, and £2 3s. for the same in terra cotta. I have now only to assure you, in conclusion, that I have endeavoured, as far as possible, to explain briefly the modes of procedure with reference to terra cotta in an architect's office; and as so little is definitely known on this point, and as terra cotta is, as far as London office work is concerned, almost a new material, I must claim your indulgence for any errors and misstatements which may have, unintentionally, crept into my paper.

EXMOUTH.*

It is a characteristic of very local historians, and writers of guide books, as a class, that all their geese are swans. Like the late Lord Jeffrey, they are nothing without their adjectives. They seem to see everything through a magnifying glass of exceeding power. The great object of every local Holinshed is to crack up his own particular locality. There are certain favourite parts to be sure, about which everybody is agreed. They are celebrated by universal consent. There are, for instance, few spots in England possessing greater claims on this score than South Devon. It is remarkable alike for beauty of landscape, its delightful climate, and the variety and interest of its historical associations. The roll of Devonshire worthies too is among the proudest in the kingdom. The county has always been regarded as one of the most favoured nooks of England. South Devon deserves all the praise given to it in the work before us. Though the author confines himself more particularly to a description of Exmouth and its neighbourhood, his work is a really valuable history of the county. Its merits, as well as its limits, place it beyond the category of ordinary watering-place guide books. The greater portion of the work is devoted to biographical accounts of the Rolles, the Raleighs, the Courtenays, and other Devonshire families, whose fortunes are so closely linked with the neighbourhood. The biography of Sir Walter Raleigh specially shows great labour and painstaking in the compilation, and is a valuable sketch of the extraordinary career of that celebrated man. Of Exmouth itself we have many interesting particulars. This town is the oldest of Devonshire watering places. It has, however, lost much of the importance it possessed in bygone times. It was in the estuary of the Exe that the small beginnings of a British navy were made nearly a thousand years ago, in the attempt to cope with the Danish invaders. In the reign of King John, Exmouth was one of the chief ports on the coast. In 1348, it contributed 10 ships and nearly 200 seamen to the fleet sent by Edward III. to attack Calais. Subsequently, Exmouth fell into decay until it became a mere "fisher townlet," as Leland describes it. Fortunately for the place, a lord-chief-justice visited it in a very bad state of health, and went away greatly benefited. Exmouth began to be a fashionable resort about 150 years ago, and, though it has not progressed very rapidly, the population of the town has increased considerably during the last fifty years. At the beginning of the century the number of inhabitants was less than 2,000, in 1861 it had reached 5,288. In spite of fog and a moist atmosphere to which Exmouth is to some extent subject, it is, in the opinion of Sir James Clarke, decidedly healthy—agues are almost entirely unknown, and less rain is said to fall here than generally along the coast. It is recommended rather as a summer than a winter residence. The rate of mortality to each 1,000 of the population does not exceed 19, or 6 less than the average of London. The time-honoured but highly inconvenient system of leasing land for periods terminable on lives, it is stated, has been one of the chief causes which have hitherto hindered the growth and development of Exmouth. However the Rolle Estate Act of 1865 gives power to the trustees of that estate to grant leases for an absolute term of years not exceeding 99 years, and every facility is now given, we believe, for building houses of the best character, and for making the capabilities of the situation, and its excellent sanitary arrangements, in the highest degree available. "Building ground," says the writer, "is now amply attainable on sites which add to all the charms of wide and varied prospect, both by sea and land, every needful condition and requirement of a sanitary sort, heretofore far too little regarded in such few and casual extensions of the town as of late years, and prior to recent changes in the management and improvement of the Rolle estates, it had been found possible to make. The improvements now in progress have two main objects—the one, the provision of sites for villas and family houses, with every attractive requisite, quite apart from the commercial quarters of the town, and yet within easy reach of it; the other, the substitution, in that quarter itself, of nineteenth century streets and shops in the place of seventeenth century ones; and the provision besides of all those improved subsidiary appliances and advantages of a watering place, which are necessary to modern comfort and to modern habits of life." It is recorded that Francis Danby, the painter, was attracted to Exmouth, not so much by its charms of climate as by its proverbial local advantages for the study of those gorgeous phenomena of sunrise and sunset which he knew so well how to render.

* Exmouth and its Neighbourhood, Ancient and Modern; Historical, Biographical, and Descriptive. Exmouth: W. M. Bounsall.

CHURCH TOWERS IN SOUTH DEVON.

At a recent meeting of the Exeter Diocesan Architectural Society, the Rev. William Grey read a paper on this subject. He said a paper on this subject was read before this Society in 1842, but it has been thought necessary to revert to it, partly because that paper was somewhat crude and incorrect in its details, partly because the subject is very perplexing, and has constantly proved a stumbling-block to archæologists. The case stands thus: there are a number of church towers in South Devon of a very rude and early appearance. The tower arches have square soffits, they spring from chamfered abaci, and are often nearly semicircular. Rickman conjectured that many of them were Saxon, so rude were they in their character. The windows, especially those of the bell-chambers, look like Norman or Early English work—generally of two lights, with plain uncusped heads, and no tracery. Mouldings they have none, except a chamfer. These towers are often without buttresses, and the walls batter. People call these towers Norman, or Early English, the relic of an earlier building; or they say that these plain features are built in again. To all this there are two answers:—(1) It is not denied that there may be certain examples where these plain tower arches, and perhaps some of the windows, may belong to an earlier church; but (2) such are exceptional cases, and the origin of this plain work must be sought in a certain local fashion which prevailed in the district from about A.D. 1300 to 1550. Thus the belfry windows of Denbury, of the date of 1318, are exactly the counterpart of those at Woodland, which tower was built in 1536. And the reason of this conservatism is, that good freestone was difficult to get, the quarries at Bere being distant; and such substitutes as granite, limestone, and red conglomerate, were of a rough, rugged description, and unsuitable for good mouldings or tracery. Such work as is found at Launceston Church is scarce, and must have been a severe tax on the purse and patience of church builders; and whereas it has been suggested that the perpendicular west windows of these churches have been insertions in older walls, such can scarcely have been the case with the majority of towers under consideration, for the freestone used in these windows was not of a sort to need renewal, as is the case in districts where soft oolite is the common freestone; and besides, later insertions generally leave some mark behind them, which is not seen in these towers. Besides this, plain work is occasionally found in porches, *i.e.*, in those parts of the building where such plainness and rudeness cannot mar the general effect of the interior. Hence the west window, which plays a considerable part in the interior, is not plain, but has the ordinary characteristics of tracery, cusps, &c., which all the other windows of the church possess. An inquiry into the dates of these plain towers shows that, while several of them—as Bovey Tracey, Denbury, Dartington, and Staverton—are of the early part of the fourteenth century, the greater number of them were erected in the fifteenth, and Woodland as late as 1536. If, from a consideration of the dates of the towers, we proceed to classify them, we shall find that, generally, the same outlines by no means indicate similar dates. The towers in question may, for convenience, be arranged thus:—(a) Towers with one stage, walls battering—Stoke Gabriel, Tormohun, about 1400. (b) Towers with two (or in one instance three) stages, walls battering, no buttresses or turret—Ashcombe, Belstone, Bovey Tracey, circ. 1402; Broadhempstone, 1402; Denbury, 1318; Coffinswell, circ. 1440; Dartington, circ. 1320; Hennock, circ. 1470; Lustleigh, Newton Abbot, circ. 1516; Staverton, circ. 1330; West Ogwell, circ. 1320; Wolborough, 1516; Gidleigh, Holne. (c) Towers with two stages, walls battering, no buttresses, an octagonal turret against the north or south face—Bickington, Buckland-in-the-Moor, Dean Prior, Ilsington, circ. 1420; three stages, Kingskerswell, Manaton, Marldon, circ. 1520; St. Marychurch, Woodland, 1536. (d) Towers of two or three stages, angle buttresses, generally with staircase turrets—Abbotskerswell, Antony, circ. 1410; Cockington, circ. 1485; Drewsteignton, Eggesford, Highwick, 1428; Holcombe Burnell, Ken, Moretonhampstead, Newton Bushel, 1443; Powderham, St. Thomas, 1412; Shillingford, circ. 1490; Townstall. (e) Lofty towers with face buttresses set back from the angles—Ashburton, Berry Pomeroy, circ. 1400; Chagford, Christow, Ipplepen, circ. 1440; Kingsteignton, circ. 1480; Littlehemston, 1439; Torbryan, circ. 1440. The result of all this classification is, that it is most evident that there was a great deal of conservatism in the tower building of South Devon; and that we must not argue that, because one tower has the same sort of outline as another, therefore both are of the same date. They may be, or they may not be. From the classification of the towers we go on to note some particular details in them. The plinth in most is a bold chamfer, sometimes, but not often, a hollow. West doorways are mostly exceedingly plain, but a peculiar type occurs at Dean Prior, Cockington, Newton Bushel, Abbotskerswell, Bickington, Torbryan, and Kingskerswell. Mouldings very like decorated are found in several perpendicular towers. This is only the conservatism of the district. West windows are generally of the ordinary perpendicular type, but in several examples (as Bickington, Chagford, &c.) a window with decorated ramified tracery is found—probably the east window of the older church of the fourteenth century. Tower arches are so plain that they are often called Transition Norman, or Early English; but one of this sort is found at Woodland, which cannot possibly be of any earlier date than 1536. Doorways out of the newel of the staircase are found with square lintels, and might be taken for Saxon work, but such work would not be found over work of the fifteenth century. Battlements show the same conservatism which other details do, being found in the early part of the fourteenth century, and in the middle of the sixteenth. The finish of these towers was sometimes a blunt spire, as at St. Petrock's, Dartmouth, and Hennock; sometimes a gabled roof, as at Denbury, Ilsington, Newton Bushel, &c. Probably several towers now covered with lead originally had short spires. There is one great foe which seriously hinders such inquiries as the foregoing—the limestone of the district, in the shape of whitewash inside, and rough-cast outside. One consequence of this is that the beauties of our churches (both inside and out) being obscured, if not altogether hidden,

people will not believe that they have any beauties at all, and cry out for what they call "restoration," which generally means deformation or utter destruction. May not we, as members of a Society whose motto is—*Veteres revocavit artes*, plead for a careful removal of the obnoxious whitewash and rough-cast first of all, before our ancient churches are condemned to undergo the calamity of a so-called "restoration?" Surely it is a little unfair to the memories of our forefathers to do our best to spoil and hide their works of art, and then turn upon them and say that they were utter strangers to art.

Mr. HAYWARD thought they were indebted to Mr. Grey for his paper, and the great research he had made. He thought, however, in some cases he gave later dates to the structures than he really ought. For instance, at Dartington there were traces of an old cruciform church, and in his practice he found the old parts of a church to consist of tower and perhaps a chancel. In the perpendicular period churches required to be enlarged or raised, and then they were built upon either or both sides; and the perpendicular windows were inserted not only in the chancel, but he believed also in the towers; and perhaps, owing to the towers being made to have an increased elevation, they were given the late character they now possessed. But in most cases where they found that the material used was small rubble, and the form a simple battered outline, he thought those towers were of a rather earlier date than Mr. Grey was inclined to give them. It was a question, however, open to consideration, and he had only made these remarks hearing what Mr. Grey had said in his paper. He did not think the evidence of coats of arms was worth much, because they were introduced into the churches at a much later period than they were built.

The CHAIRMAN said it had often struck him that the basements of some old churches were much older than the superstructure. A question he should like to see dealt with was, "What was it that led to the reconstruction of so many churches about the year 1450?" He remarked that there were many churches of that character around Exeter, and there seemed to be an extraordinary spirit afloat at that time.

THE LAWS OF DRAINAGE.

ON January 28th a paper was read before the Institution of Civil Engineers, "On the Relation of the Fresh-water Floods of Rivers and Streams to the areas and physical features of their basins; and on a Method of Classifying Rivers and Streams, with reference to the magnitude of their Floods—proposed as a means of facilitating the investigation of the Laws of Drainage," by Lieut.-Col. P. P. L. O'Connell, R.E.

After referring to what might be termed the first stage of natural surface drainage, subsequently carried on and completed by rills, streams, and rivers, the author observed that streams draining large areas were not subject to sudden floods caused by short smart showers, and that a lake, like the extension of the area of a drainage basin, was a moderator of the flood discharge, resulting from a given rate of rainfall. There were other natural moderators which were more or less effective, as, for instance, a porous, absorbent soil, and the foliage of dense forests, but the latter had apparently the property, in some situations, of increasing the actual amount of rainfall, which counterbalanced its effect as a moderator of river floods. Snow might, according as it thawed slowly or rapidly, be a moderator or the reverse. Again, when a tributary in flood flowed into a large main river, the channel of the latter also acted as a moderator. If a series of natural basins could be found, increasing regularly in area, having physical features as to slope, soil, &c., all tending in the same degree to discharge the rain falling on them, and if the distribution of the rain were the same in all these basins, then, doubtless, the rate of discharge in floods might be described graphically by some regular curve, the abscissæ of which would denote the area drained, and the ordinates the flood discharge per second. This curve would be concave to its base, and the tangent at its origin would have a value representing exactly the maximum rate of rainfall. Such, however, were the diversities of physical features in river basins, and in the distribution of rainfall in the world, that the search after the desired series of natural basins possessing exactly similar characteristics would probably be a vain one. This was to be regretted, for rivers small and great might alike be referred to some such curve, and classified as flood dischargers, according as they took up positions near to or distant from the curve.

To supply the place, as a classifier, of this unknown curve, the author suggested the use of the common parabola, as follows:—Let x, the abscissa of a point in the curve, represent the area in square miles drained by a river, and y, the ordinate of the same point, represent the number of cubic yards discharged per second by that river. Then, in the common parabola, $y = M\sqrt{x}$, where M might be termed the modulus of the river, or of its drainage basin, as a flood producer. When M was large, it would indicate that the physical features were such as to slope, soil, total amount and distribution of rainfall, as to give the river and its drainage basin a high place in the classification. When M was small, it would, on the contrary, show either that but little rain fell on the basin, or that it possessed some of those physical features which tended to moderate floods.

The author had prepared a table exhibiting a few of the physical features of some of the principal rivers of North America, Europe, and India. This table gave the area of the drainage basin of each river in English square miles, the flood discharge of the river in cubic yards per second, with the name of the authority for this statement, the flood discharge of the river in cubic yards per second per square mile drained, and the values of M in each case. The facts so collected were also exhibited in diagrams. After commenting upon the range in the values of M thus recorded, it was observed, that whereas, in the case of large rivers, the parabola expressive of the relation between the area drained and the discharge per second might, without sensible error, be supposed to have its apex situated at the origin of the co-ordinates, in the case of small districts this supposition would lead to error. In the latter instance it became necessary to ascertain, at least approximately, what was the maximum rate at which rain fell in the district, and to place the origin of the co-ordinates at a point in the curve where the inclination of the tangent to the axis of x should correctly represent that maximum rate.

For the sake of illustration, it was assumed that a district existed in which the maximum rate of rainfall was 5in. an hour, and the maximum value of the modulus M was 20. This required that the origin of the co-ordinates should be situated at a point in the parabola where its geometrical tangent was inclined to the axis of x, at an angle whose trigonometrical tangent was 120. If x' and y' were the rectangular co-ordinates of the curve, measured from this point, its equation was $y' = 20\sqrt{x' - \frac{y'}{120}}$, the areas being measured in square miles, and the discharges in cubic yards per second. But as, for small districts, it would be more convenient to measure the areas in acres, and the discharge in cubic feet per second; the formula became, when adapted to these new measurements $y' = 21.4\sqrt{x' - \frac{y'}{5}}$ very nearly, or after the solution of this quadratic equation, $y' = -45{\cdot}726 + \sqrt{2097{\cdot}28 + 457{\cdot}96\,x'}$.

A table, computed by this formula, was then given, showing the discharge in cubic feet per second from districts increasing in size from 10 acres to 5 square miles; and it was stated, while the discharge from an area of 10 acres represented a rainfall of 3·56 inches an hour, that from a district having an area of 5 square miles represented a rainfall of only ·36 of an inch. It was stated, that in rivers whose basins were by no means small, very extraordinary floods might occur in years not remarkable for large totals of rainfall; and, in conclusion, a few statements and quotations were given, as affording examples of flood moderators.

PLASTERERS' WORK IN PARIS.

MR. C. BARTLETT, one of the artizans who reported on the Paris Exhibition, makes the following observations on plasterers' work in Paris. He says in Paris the position of the provincial plasterer is changed very much indeed, as compared with London. He may be a tolerably good hand at his trade in some of the provinces; but he comes to Paris, and he loses, so to speak, some of his trade. Instead of miles of brickwerk fronts covered with cornice, jamb, architrave, scrolls, and other work in Portland, mastic, or Roman cements, miles of buildings, six or seven storeys in height, meet his gaze, built with a cream-coloured stone—stone, too, be it remarked, of good quality, not throwing off scales, blisters, or crumbling to a speedy decay—stone worked into every form of architectural embellishment, the work of to-day standing beside that which has stood for ages, and bidding fair to be objects of admiration for ages yet to come; but we look in vain for those plastered places we see in and around London; in fact, plastering does not exist in Paris, either as to quality or quantity, as with us. If we turn to the outlying districts, we shall seek in vain for the speculating building, in six, eight, and ten-roomed houses, made to sell, and which are such a rough nursery for many of our plasterers, but which are, in many cases, the starting-point of some of our best workmen. The fine buildings of Paris, like our own, are not favourable for acquiring that speed and dash which all must get who work in "field work," where the endeavour is made to give up all, or as much as possible, to the plasterer, as soon as the building is sufficiently forward to take the first coat of lime and hair, or the unknown conglomerate that is made to pass as such.

The French architects use plasterers' work sparingly in their first-rate buildings, and in situations where the presence of plastering would not be suspected. For instance, in the new Imperial Library, the coffers, &c., of the arch springing from the gigantic piers in the reading-room or hall are plasterers' work of first-rate quality; but, from its great height, and the absence of plasterers' work in other parts of the hall, plasterers' work would not be suspected. Again, in that very beautiful erection, the Church of the Holy Trinity, nearly facing Rue de la Victoire, and close to Rue Clichy, the richly-decorated interior of which is of stone, with the exception of some massive pillars separating the galleries from the body of the church—these alone are of plasterers' work, and among the best plasterers' work in Paris; and those columns or pillars harmonize completely with the colour of the stone work, so that even when close to them you would not take them for other than stone work. First-rate plastering is not the rule in Paris, but the exception; more so than with us. In secular buildings, viz., dwelling-houses, hotels, &c., the plasterer has less to do than with us. The ceilings are not enriched so commonly with mouldings as with us—the painter and artistic decorator superseding all others in making blank spaces agreeable to the eye.

The French artizan has less choice of materials than the English. While the latter has many different cements to work with, the Frenchman has very few indeed, mainly working in that plentiful material plaster (gypsum, or sulphate of lime), the coarse being used for rough floating, and for finishing the plaster is sent through a fine sieve. The plaster setting quickly is a great advantage, as it enables them to finish a room off at once, so that one preparation is enough for, say, one room. With us it is very different, as we have to wait for the drying of the different coats, causing delay, besides keeping more in hand at one time, and finishing nothing right off. The style of work seems rather wasteful to an Englishman. The French plasterer, for good work, makes use of rules, or strips of wood cut thin. These he beds, or "sticks" against the ceiling, walls, or partitions, to serve as guides for the floating-rule with which he floats the walls, &c., straight. This adds to the price of the work the time of the carpenter and the cost of the timber. With us the system is to form our lines or "screeds" with the materials with which we may be working in cornices, whether for internal or external work. Our system and theirs are, with very slight modifications, the same.

External work is more often done in plaster than other materials. It would not last, perhaps, more than twelve or fourteen years; but in their more genial climate may possibly last thirty or forty. The work is jointed, veined, coloured, or tinted, sometimes painted to imitate stone; in either case the imitation is generally successful. A casual observer would pass by and think it a stone front that he was passing, the idea being helped by the smooth finish of the work, which is not finished by a wooden float, as with us, but is trowled or worked smooth. In cornices, whether inside or out, the Frenchman uses more tools than we do. We use straight-edges, or joint rules of cast steel, with a few small tools; this is all that is required for our intersections or "mitres;" but there (*i.e.*, Paris) the workman uses wooden moulds, made to the shape of the various members of the cornice he is forming, those said moulds being akin to those used by our masons.

This takes considerably more time than we are in the habit of spending on such work. In plain work they use fewer tools than we do. The principal tool is a rather broad, thick, triangular trowel. With this he lays or spreads on his material, afterwards using one edge as a drag to scrape down all those parts that may be uneven; the work is then finished with a fine coat worked smooth. They are not so particular as ourselves regarding the colour of their plaster. We look with distrust upon high-coloured plaster, well knowing it sets too quickly to be worked properly, with the grave defect of "giving" or softening after it has been laid on for a few hours. Hawk-boys are unknown in Paris. The men are attended by labourers, who frequently become plasterers themselves. The work executed in Portland and Roman cement calls for no special comment.

LEICESTER SQUARE.

"WHEN things come to the worst they mend," they say. Leicester-square is about to furnish an illustration of the saying. Most persons will agree that a more happy illustration would be difficult to find. That long familiar and much ridiculed neighbourhood was thought to be almost past improvement. The announcement, therefore, that an attempt is about to be made—and has indeed been begun—to improve Leicester-square, morally as well as materially, is all the more welcome. It is noteworthy that the initiative in this matter has been taken by a French gentleman, M. Paul Vargnes, the proprietor of the Hotel de Paris and Albion. His praiseworthy efforts, it is said, are being seconded by a number of his countrymen, who are anxious, we hear, to see the wretched square converted into a sort of Palais Royal on a small scale. The first step in the right direction has been taken by M. Vargues, who, out of a miserable place of entertainment at the corner of Leicester-place, has fitted up a handsome hotel at a cost, we believe, of about £10,000. It is well known that powers to deal with Leicester-square have been conferred by a recent Act of Parliament, and the programme of improvements in contemplation embraces, it is understood, the erection of a theatre on the site of Savile House, while the enclosure itself will be occupied by shops and well-conducted restaurants, which would take the place of the questionable establishments which now abound in the neighbourhood. Connected with "Leicester's busy square" are many interesting reminiscences and associations. It was originally named Leicester-fields, from the mansion at its north-east corner, built for Robert Sydney, Earl of Leicester, who died in 1677. Pennant, with happy alliteration, termed this house "the pouting place of princes," because George II., when Prince of Wales, having quarrelled with his father, retired to Leicester House; and his son, Frederick, did the same thing for the very same reason. The Prince died here in 1751; his eldest son occasionally residing here until his accession to the throne as George III., when in front of the mansion he was hailed king. Elizabeth, Queen of Bohemia, daughter of James I., mother of Prince Rupert, grandmother of George I., died in Leicester House, whose last royal tenant was the Duke of Gloucester, grandson of George II. It was here that Evelyn visited Lady Sunderland, who, for his amusement, sent for a famous fire-conjuror, who placed a red hot coal on his tongue, and retained it there while a live oyster laid on it was cooked. In the adjoining house Peter the Great was entertained by the Earl of Carmarthen in 1698. This house afterwards became the property of the Savile family, and was destroyed three years ago by fire. Eastward to the ruin of Savile House in Leicester-place is where Charles Dibdin built in 1796 his *Sans Souci* theatre for his musical entertainments. The premises No. 2, now a hotel, occupy the site of "The Feathers" public-house, frequented by "Athenian Stuart," Scott, the marine painter; Luke Sullivan, the miniature painter, who engraved Hogarth's "March to Finchley;" Captain Grose and Mr. Hearne, the antiquaries, &c. Sir Isaac Newton resided near the square in a house still standing in St. Martin's-street. Hogarth lived in the house afterwards converted into the Sablonnière Hotel, and Sir Joshua Reynolds at No. 47, on the opposite side of the square. In Lisle-street lived Henry Boue, R.A., the enamel painter, who received for an enamel, 18in. by 16in., the enormous sum of 2,200 guineas; in Orange-court, Opie, the painter, resided; and No. 11, Green-street was the residence of W. Woollett, the landscape and historical engraver, who, whenever he had finished one of his masterly plates of Wilson's pictures, used to fire a cannon on the roof of his house. Altogether, Leicester-square and its neighbourhood is one of the most historically interesting spots in the metropolis.

COTTAGE AT HOLLY VILLAGE, HIGHGATE.

WE this week illustrate one of a group of eight detached cottages, which have recently been built at Highgate, for Miss Burdett-Coutts. The cottage consists of a principal and upper floor, and is designed to be occupied by one family and by a lodger, who requires good and at the same time retired apartments, and whose wants can be attended to by the family who let the rooms, without interfering with the privacy of either. The entrance is through an open porch in the west front; a door opposite opens to the lobby of the house proper, and another at the right hand on the lobby of the lodger's apartments. These rooms, which enter from their own lobby, consist of a parlour and bed-room, with water-closet, a coal cellar under the stair, and a pantry. The family house contains, on the ground floor, a parlour, kitchen, wash-house or scullery, and a pantry, with a water-closet entered from the lobby, which is 7ft. wide, and contains the staircase to the chamber floor. This floor contains three good bed-rooms. The style adopted, it will be seen, is domestic English Gothic, carried out with considerable fulness of detail and ornamentation. The internal finishings are executed in the same taste as those of the exterior. The walls are constructed of good stock bricks, the external face work being executed with paviors—a superior kind of stock bricks, which are harder and have a richer and more uniform colour than the common bricks. The plinths, string-courses, door and window jambs, and the ornamental facework, such as lozenges, diamonds, &c., are executed with white Huntingdon bricks. All the corners of the walls, and of door and window jambs, are splayed with a quirked bead. Portland stone is employed for the window cills, detached shafts, moulded parts of chimney heads, and in other situations where brick is not desirable. To prevent damp rising in the walls, the following mixture was laid on them at a level of 6in. above the ground line, viz.—5 pails of dry washed sand, 2½ pails of lime, 4½ pails of gas tar, 4lb. of pitch, and 1¼lb. of tallow, boiled together for four hours and laid on hot. The external woodwork is of Moulmein teak, well varnished, the internal woodwork being of the best Baltic timber. The roofs are first covered with Croggon's patent asphalted felt, which is laid upon rough boarding, and then slated with Cumberland slates of a delicate green colour. The bands and figures are executed in darker shades of slate, Staffordshire blue tile being used for the ornamental ridges. Our illustration gives north, west, south, and east elevations, with plans of the ground and chamber floors, and roof; also, sections and details of the principal features of the building. The cottage is from designs by Mr. H. A. Darbishire, architect.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

AN evening meeting of this society was held at its rooms, 22, Hart-street, Bloomsbury, on Monday last, at eight o'clock, Mr. Henry Campkin, F.S.A., in the chair. Mr. Thomas MILBOURN (architect), Hon. Secretary, read an interesting paper "On the Church of St. Mary Somerset, Upper Thames-street." He observed that this edifice (about to be pulled down) is situate in the Ward of Queenhithe, on the north side of Upper Thames-street, and at the corner of Old Fish-street-hill. It is dedicated to the Blessed Virgin, with the additional epithet of Somerset, from its proximity to a port or haven in olden time called Summers Het or Hithe, resembling that of Queenhithe. It is of early foundation. In 1335-6 the patronage of the living was vested in Sir John de Peyton. After the destruction of the ancient edifice in the Great Fire, the parish of St. Mary Mounthaw was united to the parish of St. Mary Somerset. Mr. Milbourn remarked that of the building prior to the Great Fire but faint record remains, the earliest mention being in the will of one "Thomas Wylforde," citizen and fishmonger, of London, dated 8th November, 1405, by which it appears that some additions to the church was in contemplation; and the few other records go to prove that the ancient building possessed the necessary requisites of an ecclesiastical edifice, and was of no mean size or character. After the Great Fire, the church was rebuilt and finished in 1695, from the designs of Sir Christopher Wren. The plan of the church is a parallelogram, with a square tower, which stands at the north-west corner. The length of the church is 83ft. by a width of 36ft., and 30ft in height. The height of the tower to the summit of the pinnacles is 120ft. After describing the church, Mr. Milbourn proceeded to describe the monuments and inscriptions in the church, observing that those of the present building are but few, but of those in the earlier edifice there has fortunately been preserved some interesting record in the MS. Heraldic Notes taken in 1597 and again in 1611. The list of the earlier monumental inscriptions and arms was a long and particularly interesting one, containing many curious memorials of the old citizens. Of those in the present building he specially mentioned that to the memory of Gilbert Ironside, Bishop of Hereford, who, dying in 1701 at his London residence in the parish of St. Mary Somerset, was buried in this church; but, in consequence of the proposed demolition of the church, the remains of this prelate have been recently removed to Hereford, and interred in the Lady Chapel of the Cathedral. Mr. Milbourn next gave a list of the rectors and patrons of the church, from the earliest to the present time, and concluded his valuable paper by reference to the various charities and benefactors to the parish.

Mr. W. H. HART, F.S.A., exhibited and described four MS. books of "Hours of the Blessed Virgin." The books are in good preservation, and probably as old as the fifteenth or sixteenth century, and the illuminations, illustrating various scenes in the life of Our Lord, and other scriptural subjects, are of beautiful character, the colours and gold employed being almost as bright as when first used. Mr. T. Gunston exhibited Roman antiquities from Tokenhouse-yard, and Mr. John Expeice (director of the evening meetings) exhibited examples of ancient pottery from Old Ford, and fragments of Samian ware, lately discovered in Fenchurch-street, were contributed by Mr. Watts. An interesting discussion ensued on the various subjects before the meeting, in which the chairman, Mr. A. White, F.S.A., Major Heales, F.S.A., and other gentlemen took part, and thanks having been duly accorded to Mr. Milbourn, Mr. Hart, and the Chairman, the proceedings terminated.

THE OXFORD MUSIC HALL.

THE Oxford Music Hall, the largest, we believe, in London, the Alhambra excepted, was destroyed by fire on Tuesday morning. The fire was discovered by the watchman, at about 3 a.m., who found the seats in the right-hand corner of the gallery facing the stage in a blaze. The flames soon spread to the roof and the body of the hall, and in less than an hour the whole of the roof fell in. The destruction fortunately is not so great as in recent fires at similar buildings, and it is stated that there is not a single hole in the flooring caused either by the fire or the fall of the roof. In the cellars beneath the building, an immense quantity of wines and spirits are stored, and had the flames reached these the result can hardly be imagined. The gallery, on which so much material fell, has sustained no essential injury. This is owing to its peculiar construction, which was illustrated some years ago in the BUILDING NEWS. The gallery is constructed on a principle of leverage, the resisting power being the whole weight of the wall, or superstructure over the end pinned into the wall, while a heavy beam acted as fulcrum—so that only a comparatively small portion was overhanging, and it is all but impossible to have been broken down by the falling materials. We understand the plans and particulars are still in the hands of the architects, Messrs. Finch, Hill, and Paraire, and that there need be no delay in restoring the premises—on the other hand, it is stated the directors contemplate doing the work themselves. Whether such a course will prove an advantage to the shareholders has to be demonstrated.

It is not decided that Her Majesty's Theatre should be re-erected. In fact, there is considerable doubt whether it will be, as Lord Dudley and Mr. Mapleson are averse to taking the initiative in the matter.

NEW PHOTOGRAPHIC PROCESS.

WE have recently witnessed, at Hayward and Leggatt's, 79, Cornhill, an assortment of photographs which have been produced by a new process. It is called the "Patent Carbon Process;" and by its aid not only are the photographs rendered permanent, but every drawing, whether it be in crayon, by pen and ink, or by the brush, has every characteristic of the artist reproduced. This is done by carbon being fixed by the action of light passing through a negative, and impinging upon a surface composed of gelatine. There is no doubt of the complete success of the process. The several hundred specimens exhibited at Messrs. Hayward and Leggatt's abundantly demonstrate that a new agent has been subordinated to the promotion of the fine arts. In looking at these specimens one has almost a difficulty in realizing the fact that they are copies. They are, in fact, *fac-similes*, and exhibit all the individuality of touch, and the peculiarity of colour and execution, which characterize the originals. The photographs are taken from drawings or sketches of the old masters, from various Italian, German, French, and other continental galleries. The photographs exactly resemble the originals in size, colour, and artistic minutiæ, and what renders them still more valuable is, they are absolutely permanent. Being cheap, we fully expect that these copies from the old masters will be extensively appreciated and sought after.

NEW TOWNHALL, MANCHESTER.

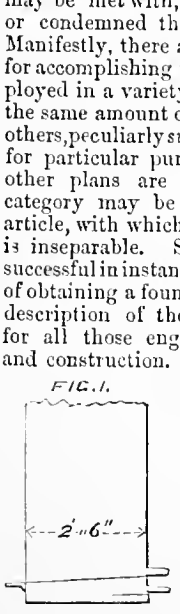
OUR Manchester correspondent says:—"The designs for the final competition are to be sent in to-day (Friday). It will be remembered that, in the first competition, the Council selected eight architects out of the 123 who submitted designs, and awarded £300 premiums to each, on the condition that he prepared a complete set of plans for the final competition. We hear that the drawings are most elaborately got up, and highly finished, and many of them are of great size. They will probably be exhibited shortly, when we may have an opportunity of judging whether or not the selection of the Council in the first contest was the result of influence or of merit. Of course, in any comparison between the selected and the rejected designs, the perspective views ought to be left entirely to themselves, and the geometrical views only placed side by side. Leaving merit, however, out of the question, and weighing the chances of the several competitors in the scale of influence, the race appears to be really between—Messrs. Speakman and Charlesworth; Mr. Solomons; Mr. Waterhouse; Mr. Worthington—who will, if the general opinion in Manchester prove correct, be "placed" in the above order. When the subject comes again before the Town Council it is expected that the supporters of Mr. King's scheme will once more endeavour to carry their amendment, which is a proposal to substitute a square site for the present awkward triangular one. Should they succeed the selected plan will have to be considerably altered, and possibly undergo an entire re-arrangement. It is to be regretted that the question was not finally settled in favour of a rectangular building before the competition took place."

ELEMENTS OF ENGINEERING.

SCREW PILES.

IN the erection of any structure in a locality where the violence of a rapid tideway, or intermittent flood, is combined with the treacherous character of a loose and alluvial substratum, there are two principal difficulties to be succesfully surmounted. The one is to avoid presenting more than the minimum resistance to the fury of the current; the other to obtain so firm a hold in the ground, as to defy all future attempts at scouring or uprooting. Solidity was the distinguishing characteristic of the engineering and architectural works of our ancestors, and it was, doubtless, by a rigid adherence to this guiding principle, that they constructed bridges with spans of dimensions so limited, and with piers of dimensions so enormous, that their total area considerably exceeded the waterway left for the stream. However unscientific the design, it must be yet admitted that the execution was good; and there is not the slightest doubt, but that the architect of old London-bridge would have succeeded in bridging the Jumna, the Ganges, or the Saone upon the same system that he accomplished the spanning of the Thames, although he might have been half a century about it. Fortunately, modern engineers have been spared the task of endeavouring to apply to incongruous examples, the methods of their predecessors. The progress of invention has supplied means for vanquishing each peculiar difficulty as it may be met with, and precedent has confirmed or condemned the utility of their adoption. Manifestly, there are certain general methods for accomplishing results, which may be employed in a variety of instances with nearly the same amount of success, and there are also others, peculiarly *sui generis*, admirably adapted for particular purposes alone, and for which other plans are not suitable. Under this category may be included the subject of our article, with which the name of Mr. Mitchell is inseparable. Screw piles have proved so successful in instances where the usual methods of obtaining a foundation have failed, that a description of them possesses much interest for all those engaged in the art of designing and construction.

FIG. 1.



The ordinary screw pile is represented in elevation in fig. 1, which shows the end portion cast upon Mitchell's principle, to which the upper lengths are bolted. A very usual dimension for the size of the pile is 2ft. 6in. in diameter, but any size may be adopted, provided it is borne in mind that the difficulty in getting it down, varies directly as the area of the flanch. Besides, if a certain dimension be exceeded, the pile virtually ceases to bear that character, and becomes transformed into a cylinder, which constitutes in itself a different system of foundation. The upper lengths of the pile are formed slightly different from that carrying the screw, and are represented in elevation in fig. 2, and in plan in

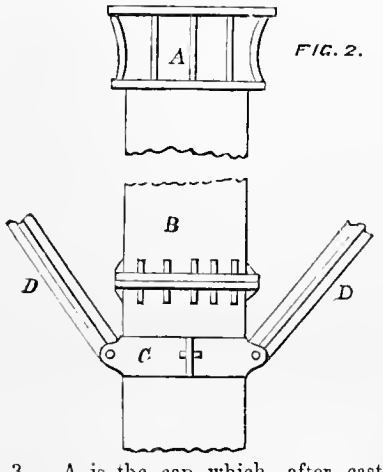


FIG. 2.

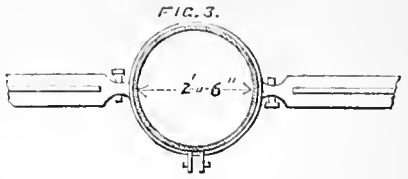
fig. 3. A is the cap which, after casting, is turned in a lathe to ensure a true bed for the girder to rest upon, and also to give a finish to the appearance of the pile. The average length of each separate casting is about nine feet, some shorter lengths being always cast in addition, to bring the pile up to the proper level, as it might in some situations be nearly impossible to get it down for another length of nine feet, supposing the preceding length was below the proper level. Owing to the great length of the piles in comparison with their lateral dimensions, they require to be strongly braced together by

FIG. 3.



diagonal ties and struts, so that they should form a complete framework of rigidity and lateral stiffness. This is accomplished by the braces D, which are of the section shown in fig. 4. They are connected to the piles by

FIG. 4.

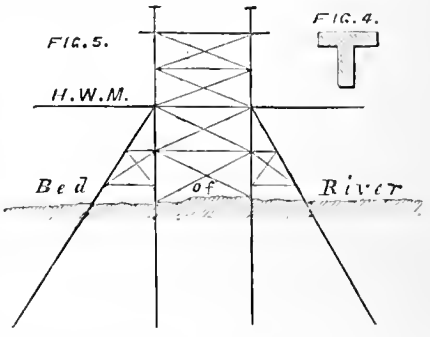


FIG. 5.

means of the wrought iron rings C, which are fixed round their circumference, and are either rivetted or bolted to the extremities of the braces. This arrangement is shown in plan in fig. 3. Flanges are cast upon the ends of the separate nine feet lengths, and they are thus bolted together, as at B in fig. 2. Of all the applications made of the principle of screw piling, the most extensive is that carried out upon the Bombay, Baroda, and Central India Railway. Upwards of six miles of bridges, in the aggregate, have been erected by their aid throughout the line, and it is very questionable whether any other means could have been substituted with the same amount of success and advantage, in an economical point of view. It may be mentioned that the velocity of the floods in rivers similar to the Jumna and Nerbudda reached a maximum of ten miles per hour, with an average depth of fully forty feet. The portion of the pile shown in fig. 2 is that which stands above the level of low water. That below that level, and also the part penetrating the bed of the river, has the flanges, by which the several lengths are bolted together, cast upon the interior instead of the exterior of the circumference, so as to present no impediment to the free descent of the pile through the ground. We have already mentioned that the diameter of the pile should not exceed certain limits, and it is equally apparent that it should also possess a dimension sufficiently large to allow of a man getting inside and bolting the different lengths together. Wherever the current acts in contrary directions, the piles must be strengthened by the addition of others, fixed in an oblique direction, and tied to them at intervals by diagonal bracing. The general arrangement of this description of strutting is shown in the skeleton elevation in fig. 5, and it must be borne in mind that, in consequence of the variable nature of the strains, all the braces must be made of a section suitable for resisting both tension and compression. This is an important point to be attended to, for a diagonal bar that would solely resist a considerable strain of tension, would be of little or no use if that strain were changed to one of the opposite character.

Screw piles are well adapted for obtaining a foundation in situations similar to that of a sandbank, and where the usual means would be unavailable. They have also been much used in the erection of lighthouses, a description of construction probably demanding their aid more than any other, and, by their agency, these safeguards to the vessels and subjects of every nation may be now established in lo-

calities where the difficulties in the way of securing a firm basis for the superstructure were recently regarded as insurmountable. From their light and elegant appearance they would be very suitable for supporting the girders of piers, jetties, and other designs intended more for light traffic than for loads similar to that of a locomotive. There is this drawback connected with their employment in salt water, viz., that cast iron rots rapidly when exposed to the influence of the sea, either in the open, or when the salt water reaches it after mingling with a river. It becomes in some situations so soft that it may be cut with a knife. As an instance of the rapidity with which screw piles may be screwed down, it may be quoted that Mr. Brunel, by the aid of capstan bars, worked by strong hand winches, screwed a cast iron cylinder, 8ft. in diameter, down to a depth of 60ft. in forty-eight hours, the strata passed through being stiff clay, sand, and marl. A distinction must be drawn between screw piles, which we have just described, and what are known as disc piles. The latter are not actually screwed into the ground, but the earth is loosened below them, and an alternating motion being imparted to them, they gradually sink down. They are particularly adapted for getting good foundations in sand, which is loosened by forcing water or other fluid under a strong pressure into it, until it permits of the pile descending to a hard bottom. The disc pile has been very successfully applied in several sandy localities by Mr. Brunlees, who was the first to introduce this peculiar method of sinking them. We must reserve for another occasion the subject of cylinders and caissons, which possess many features of interest in connection with Engineering.

LONDON PERMANENT BUILDING SOCIETY.

THE London and General Permanent Building Society held its second annual meeting on Monday. Mr. Thomas Hughes, M.P., presided. The report stated that the progress of the Society had been such as to warrant the directors in believing it to be unprecedented in the history of building societies. During the past year the sum of £14,000 had been advanced to members for the purchase of houses. The securities taken by the trustees amounted in the aggregate to £18,740. The receipts in the first year from subscriptions and deposits alone amounted to £1,027; in the past year they had been £14,332. To the 31st of December, 1866, 1,141 shares had been issued to 329 members; on the 31st of December last the shares numbered 1,936, held by 517 members. The directors recommended the payment of 5 per cent. interest to all members up to the 31st December, 1866, and for the past year a profit to all at the rate of 7½ per cent. Three retiring directors, Messrs. Hughes, Dunn, and Allan, were re-elected, and a sum of money was voted to the directors for their energy in promoting the business of the Society.

THE LATE GALE.

DURING the late gale which raged over the whole kingdom, a stack of chimneys was blown down at Scarborough. It fell through five storeys, landing on the basement floor, killing one man and injuring four others. At the coroner's inquest the borough surveyor, who attended, stated that not only were the buildings badly constructed, but that very serious discrepancies existed between the work done and the plans deposited before the Local Board. The chimneys should have been erected in double stacks, and would then, in his opinion, have been safe. The walls of the houses were in such a condition that, if the props were taken away, they would speedily fall. The staircase walls, instead of being 9in. thick as stated in the plans were only 4½in. thick, and he believed such a wall, a half brick in width, 48ft. high, was not sufficient to insure the safety of the building. We should think not, and trust that the Local Board will have something more to say on the matter.

A considerable portion of the ancient ruin known as Macduff's Castle, at Wemyss, Scotland, fell to the ground last week, having been weakened, it is supposed, by the late severe storms. The castle is believed to be at least one thousand years old, and some parts of the masonry have been honeycombed to the depth of 5in. by centuries of exposure to the weather.

On Tuesday morning, the inquest was resumed, at the London Hospital, on the body of Mrs. Eliza Thompson, one of three women who were killed on the 1st inst. by the fall of a chimney shaft at a factory at Bow. Mr. James Edmeston, architect and surveyor, of Old Broad-street, who had examined the remains of the chimney, gave it as his opinion that the occurrence was due to the bad state of the mortar, which had deteriorated by age. The action of the heat from the fires, combined with the rains from the west, would disintegrate mortar very quickly. The chimney fell from west to east. Mr. Wilson, the district surveyor, concurred with the evidence of Mr. Edmeston. The jury returned a verdict of "accidental death," and recommended that such shafts should be regularly examined, so that any deterioration in the quality of the mortar might be discovered in time.

DEATH OF SIR DAVID BREWSTER.

SIR DAVID BREWSTER, Principal of the University of Edinburgh, and one of the greatest natural philosophers of his age, died at his seat, Allerley House, near Melrose, on Monday night, in the eighty-seventh year of his age. He was born at Jedburgh on the 11th December, 1781. Fascinated with experimental science, he abandoned the idea of entering the ministry, for which he studied. His first experiments on light were made in 1799, and from that time he studied the phenomena of optics and the properties of light with unwearied industry, obtaining results which, when given to the world, procured for him the highest distinctions. It was in 1811 that he was led (from a proposal of Buffon) to suggest the construction of a lens out of zones of glass, each of which might be built up of several circular segments, and to propose its application to an apparatus consisting of lenses and mirrors, by which the whole light of the sun could be collected into a burning focus, or condensed into a parallel beam of light. This beautiful invention is now in use in every lighthouse in Great Britain and the colonies. Four years later Dr. Brewster's discoveries of the law of the polarisation of light by reflection, and his analysis of solar light, brought him additional fame. In 1816 he invented the kaleidoscope, the patent right of which was evaded, so that the inventor gained little beyond fame, though the large sale of the instrument must have produced considerable profit. To Brewster also belongs the credit of the suggestion which led to the formation of the British Association for the Advancement of Science. His various scientific works are well known and popular. In 1832 Brewster was knighted by William IV., and it may be said of him that he died literally loaded with honours and decorations.

ART WORKMANSHIP.

THE criticisms we freely offered on the specimens of art workmanship exhibited this year at the Society of Arts have been supplemented by a report from the joint action of Mr. Redgrave and Mr. Digby Wyatt. The works of the successful competitors which had obtained prizes were handed round the room, and were much admired. They were ninety-four in all, and comprised specimens of carving in stone, marble, and oak, *repoussée* work in metal, hammered work in brass and iron, chasing and engraving on metals, painting on porcelain, decorative painting, engraving on glass, wall mosaics, bookbinding, and many miscellaneous subjects.

The report says that No. 68, a female head, "Summer," by Mr. Mark Rogers, is a small work of very great merit, carved by the practised artist whose works have already received the utmost recognition and commendation at our hands. Upon the whole the most satisfactory works to which we have awarded prizes in this division have been contributed by Mr. Brangan and Mr. Dugardin—the former, in a good average style of wood-carving, manifests the possession of considerable taste as well as dexterity, the latter, both in wood and plaster, shows specimens of flower carving of peculiar tenderness and delicacy of handling. Mr. Leach's frieze (No. 89), and "A Midsummer Night's Dream," is very clever; and there is a very agreeable *naivete* in Mr. Goddard's "Girl's Head," carved in pear tree (No. 70). Of the works sent in in accordance with the prescribed designs, the most uniform excellence is shown in the various processes of metal working. Mr. Dufour's *repoussée* work is excellent, as is Mr. Hatfield's (senior) chasing of the "Virgin and Child." In the last-mentioned specimen we recognized an element not often to be met with in these competitions—the handicraft was kept in due subordination, and not suffered to divert the spectator's attention from the general scope and artistic purpose of the model. Too often in such objects the chasing of an angel's wing is made more telling than the angel's head; or the flowers trodden on by an amorino's foot may have had infinitely more pains bestowed upon them than has been given to the definition of the foot itself. So the major is often, through the art-workman's egotism, made to hide its head before the minor; but of this solecism Mr. Hatfield, sen., had steered clear with most commendable taste. Mr. Fisher's marble-carving is very satisfactory, since it shows that the sculptor can not only execute but design. His re-arrangement of the subject given, so as to adapt it to fill a lunette instead of a frieze, has been skilfully managed, and in all the slight changes and additions involved through the re-arrangements he has well maintained the spirit as well as the letter of his pattern. The stone and wood carving is of good average quality, but calls for no special remark. In the pierced work in metal, "ornament after a missal cover," Mr. A. E. Milward in silver, and Mr. J. H. Hatfield, jun., in bronze, have attained rare excellence. Mr. E. Milward has made a good wrought brass knocker, while Mr. W. Sendall's, in iron, is first-rate. We were glad to recognize the perfect success with which, in glass-blowing, Mr. Joseph Leicester had reproduced the tazza from South Kensington. Mr. Oppitz's glass engraving and Mr. Genth's binding (especially the specimen in morocco) were excellent. In the application of painting to industry, the specimens of figure-painting on porcelain by Mr. E. Saunders and Mr. W. J. Nunn, and of ornament painting by Mr. Fisher and Mr. Slater, were better than usual. In the class of decorative painting, however, with the exception of the *grisaille* reproduction, after a picture-frame in the South Kensington Museum, the arabesques contributed furnish a very inadequate idea of even the common run of good trade work in decorative painting, the colouring in all cases being inharmonious, and the style of handling laboured and mechanical. In the same way the competition for the prizes for illumination was not what, in these days, when almost every weekly publication is overflowing with clever illustrations, we have a right to expect. There was a total absence of life and spirit in the specimens sent, the best rising only to about the level of neatness. The die-sinking and wall mosaics were not "up to the mark," but the engraving on ivory, by "G. B.," was very good, and shows something better than much we have seen upon pretentious specimens of furniture, which failed only to attain great excellence through the feebleness and occasional scratchiness of the engraving of the ivories with which they had been inlaid. In conclusion, we beg to offer the following suggestions, if not for adoption, at least for discussion:—Firstly, we think the time has arrived when animation might be given to future competitions by a considerable change of programme. Especial prominence might be given to evidence of ability in processes not commonly practised in this country—such as several of those involved in the manufacture of Venetian glass; in the execution of enamelling, both upon earthenware and metal bases; in the application of painting and lacquering, as in Japanese and Cashmerian work; in damascening, both after the Milanese and Oriental systems, &c. From such efforts new branches of national industry might possibly arise; and, at any rate, working men would be induced to exercise their ingenuity, and to acquire that pliability of general aptitude in which, as compared with the French art-workman, the English artificer is now somewhat deficient. Secondly, the apportionment of the money prizes requires revision, so as to bring the rewards offered into better proportion to the labour or outlay risked in the different sections by the workmen entering upon the competition, regard being, of course, had to the special branches of art industry in which temporary stimulants might seem most needed. Thirdly, prizes might be offered for evidences of proficiency in two or three branches of industry not yet included in the society's programme, as

stained glass, jewellery, brass-rule cutting, the application of turning to artistic wood or metal work, &c. Some such changes, and the withdrawal of all hackneyed models, would probably tend to relieve the apparent monotony of the society's competitions; and, after a year or two's interval, the leading features of the present programme might be reverted to with a fresh and lively interest on the part both of the art-workmen and of the public.

SHEFFIELD ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

THE first or inaugural meeting of the Sheffield Architectural and Archæological Society was held in the School of Art last week. The Hon. F. S. Wortley presided, and the opening address was delivered by Dr. Aveling. In the course of a lengthy and interesting address, Dr. Aveling remarked that they had assembled to inaugurate a new society in Sheffield—one of noblest aims and widest scope. In naming it, they had chosen two words, "Architectural" and "Archæological"—words of the most absorbing interest to mankind. Proceeding to consider the objects of the society in relation to each of these, Dr. Aveling said—It must be the object of our society to cultivate good architectural taste, and it will be our duty to keep a sharp, jealous, critical eye upon all buildings in process of building or restoration. This is an important period in the architectural history of Sheffield. New churches, chapels, and public edifices are rising on every side, and centuries hence we shall be judged by the feeling expressed in them. If future generations find them strong, simple, honest, and beautiful, they will apply those attributes to us; if they find them feeble, flimsy, paltry, and pretentious, we shall as certainly suffer in proportion, and our memories, together with the buildings we have raised, will fall in speedy ruin and lie forgotten in the dust. The architect has in his hands tremendous power for good or evil. To him we look for the production of habitations which shall enable us to have light, heat, and pure air, three things essential to our health and happiness. He must see also that our drains are so constructed that neither our air should be contaminated nor our wells poisoned. Carelessness on either of these points is certain to produce disease. Let the architect's first aim be health, then comfort, and, lastly, beauty—sanitary arrangements, sound construction, and pleasing ornamentation. If he keep these constantly in view he will win credit to himself, and never have to suffer remorse as having been the cause of suffering and death among his fellow-creatures. But ours is an archæological as well as an architectural society. Let us therefore endeavour to define what we mean by the word "archæology," and mark out the boundaries within which we intend to roam. Paleontology might be called a branch of archæology, but we do not contemplate cultivating the science of ancient beings, of fossils, and organic remains. We do not wish to go into the subject of the relative ages upon the earth's surface, nor of the luminous bodies in the sky. The word archæology, as we use it, must be confined to the works of man. The materials of history created by our forefathers are what we have to collect, decipher, and preserve. Out of these we must wring the knowledge of how our ancestors lived and died, what were their hopes and fears, their joys and griefs. We must not be content to have merely found an ancient piece of work, and hug ourselves with the happy thought of possessing it. We must look upon it as a monument, and diligently learn to read its inscription. The meanest object of antiquity is a word in the history of man.

THE HISTORIC PERIODS OF ENGLISH ARCHITECTURE AND ARCHÆOLOGY.

THE fifth ordinary meeting of the present session of the Historic Society of Lancashire and Cheshire was held, recently, in the Royal Institution, Liverpool, Mr. Matheson presiding. Mr. H. H. Vale, F.R.I.B.A., read a paper on "The Historic Periods of English Architecture and Archæology." Confining himself to the first period, the "Romano-British," Mr. Vale gave a most interesting account of a visit to Wroxeter, the ancient Uriconium. We make the following extracts from the concluding portion of his paper:—On approaching Wroxeter, no towers, no columns, no temple walls give you the indication of the remains of a vast city, some three miles in diameter, for the greater part of the area of Uriconium is under the soil, and bears the rich waving harvests, the grassy meadows, the hawthorn hedges, and clumps of woodland, even as the other portions of the Severn valley do, with this exception, that the "black soil" of Uriconium, when only about six in depth, is richer than that of the deeper soil of the surrounding country. No indication of art, excepting in its ruder type, could we discover; simply rows of small square stones, resembling mosaic work, with here and there a bright red line of Roman brick bonding the whole mass together. A little further along the road, which, in fact, proved to be the Watling-street of the Roman itineraries, we alighted, and, entering by a small wicket-gate the enclosure, found ourselves in the presence of the guide to the ruins of Wroxeter. We followed him into a hut or temporary museum, and were shown some jars and ornaments which had only just been unearthed by the excavating party. After inspecting the broken Samian ware, the deer-horns used to make ornaments, pins, &c., the urns, vases, tear or unguent bottles, and coins of the ancient Roman citizens, who, without doubt, had lived and died upon the very area which we now surveyed, our guide leading, we followed him through the silent streets and courts of Wroxeter, and, as he told the wondrous tales of life and death which these exhumations have revealed, we felt a strange, indescribable sense of melancholy stealing over our minds. Here were the baths in which they had bathed, and the courts which their feet had trod; and the shops wherein they had traded, and the houses wherein they had loved and hated, and been merry and gay, were again opened up to the light of day, after lying in the silence of the grave for some thirteen centuries and more. Such scenes could not fail to awaken a train of sad reflections, nor were the other surrounding objects of a character calculated to fill the mind with more cheerful thoughts. No graceful colonnades, no curving arcades, no sculptured friezes, were here displayed to view—no rich ivy-growth, or lichen-dappled wall, to cheer the eye and refresh the heart; but rows of brick piers set in serried lines, and pieces of Roman masonry, without any of the poetry and spirit of mediæval work, and bits of crude mosaic, without the colour and expression of Gothic encaustic, and that great piece of towering, level, horizontal wall with a square breach through its base; neither arch, nor turret, nor soaring gable, to give variety of outline, nor jutting corbel to toy with a sunbeam, nor ivy branch to dally with a breeze; a dead, heavy, severe monotone reigning over these rude Cyclopean fragments of the past. There are, doubtless, many who, with antiquarian zeal, come hither and find much pleasure in exploring these ruins as a matter of scientific information, and who examine with care every coin and tile and scrap of masonry here found; but after lingering in the precincts of some of our Middle Age abbeys and castles, after sketching the delicate traceries, and measuring the shafted piers, and restoring in imagination the perspective of long arcade and shadowy chancel, one here experiences a strange dearth of romantic interest, rendered more apparent by the anticipations that one carries to the place from reading the descriptions of various writers upon the ruins of Wroxeter; yet, despite all these drawbacks, a strange fascination seems to linger about the place, a kind of realistic mystery, a ghostly entity, like a hard-cut shadow on the wall, which moves not, flickers not, changes not, but ever rests there with its dark personation of gloom and awful presentiment of sorrow. Yet, as we said before, this is no region of romance, but a real scene of matter-of-fact Roman life in Britain; perhaps hard, careful, frugal life too—a colony of farmers, doubtless, to whom a coined denarium alone expressed the moulded type of imperial grandeur—practical numismatics, in fact, being the chief fragment of the great realm of Roman fine art with which it was their lot to become acquainted. Certainly some rude flatly carved capitals have been found, but few of them would fit the roughly hewn shafts that lay beside them; their bases bore the type of a low uncultured taste, and inscriptions the lettering of an unlearned race of colonists. The brooches of bronze and pins of the horn of the deer that have been found appear to us to be rude and rough, and their weapons coarse and heavy; the craniums that have been exhumed are flat and small and undeveloped, as though intelligence had been there dethroned and driven from her temple by the hard matter-of-fact exigencies of colonial existence. These strange little tear-bottles (to which name we prefer, in spite of the dicta of the learned, to cling) are the most pathetic things they have found, and a touch of deepest poetry clings to them. Here is one of tiny proportions. Alas! some loved corpse had but one solitary mourner, perchance, to weep over its inornamated ashes; while here again is one of goodly proportions, that would hold the tears of a sorrowing neighbourhood for some great benefactor, whose good life lives even yet in this empty tear-bottle, the evaporated contents of which have long ago ascended up to heaven, with a sweeter perfume than the incense from a hundred Pagan altars.

Building Intelligence.

CHURCHES AND CHAPELS.

The church of St. Peter, Dunboyne, Ireland, has been consecrated by the Bishop of Meath. The style is Early English, and the edifice is from the design of Mr. S. Rawlinson, architect, Chesterfield.

Two hundred years ago the church of St. Catherine, Gloucester, was so battered in the siege as to be rendered unsafe for use, and a year or two after it was pulled down and the materials were converted into a market. For two centuries the parish has had a clergyman, but no church. About six months ago it was determined to build a new church; subscriptions were promised, and the Bishop laid the corner-stone. The church is now nearly completed, and it is to be opened on Easter Monday. It is of brick; and every seat in it will be free. Messrs. Medland, Maberly, and Medland, of Gloucester, are the architects.

Spafields Chapel, Clerkenwell, one of the ugliest buildings in London, has just been partially reconstructed, and a new front added, somewhat after the style of the Tottenham Court-road Chapel. An obelisk of Aberdeen granite, to the memory of the Countess of Huntingdon, has been erected in front of the chapel.

HULL.—An immediate effort is to be made to restore the Church of Holy Trinity, Kingston-upon-Hull. Mr. Gilbert Scott estimates the cost of restoration at £17,000, which, with architect's commission, and clerk's salary, will necessitate an outlay of about £20,000. Of this sum £11,200 has been subscribed. The historical associations and architectural beauty of the edifice render its preservation from ruin a matter of local, as well as of general, interest and importance.

BUILDINGS.

The Morgan Hospital, Dundee, for the maintenance of 100 poor boys, was formally opened on Thursday last. The building is in the French Gothic style, and was designed by Messrs. Peddie and Kinnear, architects, Edinburgh. It has occupied about five years in erection, and has cost about £17,000. After providing for the building, a sum of upwards of £65,000 is left by the will of the late Mr. John Morgan, the founder, for the maintenance of the hospital in all time coming.

A number of improved labourers' dwellings have just been completed at Croydon, from the designs of Messrs. Beck and Lee, architects, Finsbury-circus. There are ninety-two rooms, divided into tenements of from one to three rooms. Each living room is provided with an oven and large cupboard, and every room has a fireplace. Provision is made for all tenants to place flowers in the windows by means of balconets. Every landing has a large sink and water tap; also they are provided with a dust-shaft. The whole of the stone staircases and landings are lighted with gas. A wash-house, with six boilers and large drying-ground, is provided. Messrs. Colls and Son, builders, Moorgate-street, were the contractors.

The rooms formerly known as the "Town Rooms," in Reading, have recently been materially altered, and are now called "The Assembly Rooms." They have been tastefully decorated by Messrs. Green and King, of Baker-street. The walls of the various rooms are panelled with borders and ornaments. The colours chiefly used are Etruscan buff and red, turquoise blue, salmon colour, and light sage green.

The newly built T[illegible] and [illegible] to the Crystal Palace having been completed will be thrown open to the public to-morrow. The erection was undertaken by Mr. Hamilton, Windsor Iron Works Company, Liverpool, under the direction of Mr. E[illegible].

TO CORRESPONDENTS.

To OUR READERS.—We [illegible] obliged to any of our readers [illegible] of works contemplated [illegible].

Letters relating to [illegible] and the ordinary business of the [illegible] addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for [illegible] week must reach the office before [illegible].

NOTICE.—THE BUILDING NEWS inserts Advertisements for [illegible] WANTED, &c., at ONE SHILLING for [illegible] Words.

RECEIVED.—[illegible]—A. W.—[illegible]—E. B.—[illegible]—W.—[illegible]—H. H.—[illegible] W.—[illegible]—W. B.—E.—D.—[illegible] W. M.—[illegible] W.—[illegible]—J. F. W. G. W. P. E. F. CONTINENTAL JOINERY.

To the Editor of the BUILDING NEWS.

SIR,—I have read with deep interest your remarks, or rather statements, concerning Swedish joinery, and, but for the very forcible manner in which you make them, I should have considered you the victim of a joke. If half be true, we have very much to learn from the Scandinavians' style. They astonished the Romans of old, but their accomplishments in the present day sound like magic to the British. Such a race of fire-eaters must be altogether unearthly, and if they can thus walk over the English joiner, who has hitherto been second to none, what will they do with the mason, bricklayer, and labourer? To be on a par with the joiner, this last must have wings to fly upon the scaffold with, and a back that will bear a thousand of bricks at a time. The English joiner is generally a steady, reasonable man, a ratepayer, and the father of a family, and if his death is premature—and, as a rule, it is—it is from exhausted nature. He is invariably lantern-jawed and lean, his hands are horned, and his back humped by work. What, I ask, must these Swedish joiners be like? They must certainly feed upon sawdust, and clothe themselves with shavings; yet their labours equal that of Hercules. According to your statements, Mr. Ekman will sell a superior made window of selected wood of the average size of such in England for seven shillings, or, in other words, 12 superficial feet of sashes and frame at sevenpence per foot. Let us see what the poor joiner will get out of this, and see whether or not our consciences will let us sleep after purchasing one of Mr. Ekman's "seven shilling windows."

"It [illegible] wear [illegible] out,
But [illegible] lives."

		s.	d.	
1.	The selected wood	2	[illegible]	(in Sweden)
2.	[illegible]	[illegible]	9	
3.	Rent, supervision, &c.	[illegible]	3	(little enough.)
4.	Carriage to the port	0	[illegible]	
5.	Sweden to England	0	[illegible]	
6.	From the port to the wharf here	0	[illegible]	
7.	Rent, salesman and booking	0	6	
8.	Profit, [illegible] per cent	0	[illegible]	
	Total	6	0	

	s.	d.
Selling price at the City road	7	0
Cost, without labour	6	0
Balance for labour	1	0

Now, 3½ hours at 3½d. per hour is 1s. 0¼d., and this must be done to earn 3s. 6d. per day of 11½ hours. It is well known that not one in twenty joiners can do this in four times 3½ hours, and I know of no instance in which it has been done for a wager in twice 3½ hours. One hour at the very least is required to sharpen the tools, and when it has been done in 8 hours the man has looked like one of the Oxford eight after they have won the race, or the winner of the Derby at the "post."

I do not think it necessary to analyze any of your other statements, but I can assure you that the prices quoted are only the average prime cost of labour in London. It follows that these Swedes will cut the ground from under our feet if these prices will pay them, and we shall have to go back to the calling of our mediæval forefathers—the soil, for it would be madness not to let the Swedes do all the joinery.—I am, &c.,

A JOINER.

["A Joiner" appears to forget the important fact, that the joinery specified by us last week is produced by elaborate machinery, moved by a 100-horse power steam engine.]

Intercommunication.

QUESTIONS.

[7[illegible].]—KAMPTULICON.—I have a lobby which is flagged, and oilcloth rots upon it, so I propose to put down kamptulicon cloth; but I am told that it is impossible to keep kamptulicon clean, as it will not bear soap and water, but can only be brushed over. Will some of your readers please confirm or refute this, and tell me if kamptulicon is really more difficult to clean than oilcloth or tiles?—H.

[741.]—GOTHIC WINDOWS.—Will some of your correspondents kindly inform me what is the present practice of London quantity surveyors with regard to the tracery of Gothic windows? Do they take the cube of stone, and the circular, and other labour separately, or do they merely give the superficial area, and state thickness, giving a sketch? JUVENIS.

[742.]—CRAYON DRAWINGS.—Can any of your readers give a recipe for fixing crayon drawings, so that they can be safely bound or put in a scrap book?—T.

[743.]—VENTILATING TIMBER.—Could any of your readers inform me of a cheap and effectual mode of ventilating chamber floor timber?—R. S.

[744.]—HOLLOW BRICKS.—The following is copied from a daily paper:—"It has been found by actual experiment that cottages, damp-proof, can be built at 25 per cent. less than the present cost by using hollow machine made bricks, each brick being the size of twelve ordinary bricks." I shall feel obliged if any of your correspondents will inform me where the bricks can be purchased, or who is the maker of the machine.—H. R. C.

[745.]—CEMENT FOR AQUARIUMS.—I have tried several different cements for my aquarium, but none of them has answered so well as I could wish. If some of your readers know of a good cement, and will send the recipe to your Intercommunication, I should be obliged.—S. L. G.

[746.]—TO POLISH AND CLEAN MARBLE.—Perhaps some of your readers would favour me with a few hints on the subject of polishing and also cleaning marbles. Such books as I have been able to consult, say nothing on these points.—P. S.

[747.]—REMOVING MATERIAL.—I should be obliged by some one giving me a definite answer to the following question: Can a contractor after delivering material upon the site where he has contracted to erect a building, remove such material, or authorise its removal, without the consent of the proprietor or his architect? By removal of course I mean taking it away from the premises. Your kind attention will oblige—C. W.

REPLIES.

[714.]—ROOF CONSTRUCTION.—Without a plan it would be difficult to comprehend the exact drift of the first part of Inquirer's question. With respect to the second, for a 6ft. bearing, the scantling of the purlins should not be less than 6ft. by 4in.—J. M.

[716.]—TRANSVERSE STRAIN.—There is no rule for the distance to be adopted between bearings in experimenting upon the transverse strain of beams, girders, and bars. Each experimenter selects his own span according to circumstances. Thus, Mr. Hodgkinson selected 4ft. 6in. for some cast iron bars he tested to the breakage point; while 7ft., 9ft., and greater lengths, have been chosen in experiments upon timber. In an experiment made upon a long rod for the purpose of ascertaining the effect of continuity in beams, the span was nearly 20ft. About 5ft. would be a good distance for a bar of iron, as it would be long enough to allow deflection to come into play without permitting it to exert too great an influence, owing to the lateral dimensions of the bar being comparatively small.—GIRDER.

[725.]—ZINC.—"R. K." and "Ecce" are both correct in their replies so far as regards the insoluble and hard protecting oxide which forms upon sheet zinc; but it should be made clear that the sheets must, above all, be thick enough to enable this oxide to form without going through; and that, therefore, thin sheets—and, above all, the thin plating upon sheet iron—reap no benefit from this protecting coat, as they are destroyed in its formation.—E.

[727.]—QUANTITY SURVEYORS' LIABILITIES.—The question of "B. B." appears to me superfluous. Unfortunately, it is but too common a practice in the present time for the architect or designer of the work to pay the surveyor but a portion of his proper per centage, although the latter is equally to blame for the arrangement. There is no question, however, that such an arrangement would never stand legally, and the person who endorses the bills of quantities would be held responsible for them by any jury in any court.—A CLERK OF WORKS.

[733.]—CEMENT AND GRAVEL.—In reply to "Plebs," respecting my system of cement concrete block construction, he need not fear of the blocks bulging or crushing, for they will set as hard as a rock in a very short time. He may thicken his walls to go any height; but he can carry up his 20ft. wall, without the least fear whatever, as I stated in the BUILDING NEWS of December 13th. If "Plebs" wil send me his name and address I will put him in the way to carry out his job in every practical way.—W. MAY, jun., Northfleet.

[734.]—BUILDING MATERIALS IN NEW ZEALAND.—I have recently come from the South Island, and from fourteen years' colonial experience feel myself qualified to give practical information. I have seen the various timbers, stones, clays, &c., of the islands, and can safely say I know of no field in the southern hemisphere to vie with the islands of New Zealand. I hope to return and spend my remaining days there. My time is fully occupied from nine till five daily, but I should be pleased, after that hour, to meet the advertiser anywhere he may appoint, in the City or in Greenwich, should I not have a previous engagement.—R. H. DREW, 16, Park Road-terrace, Forest-hill.

[737.]—CAEN STONE.—The new façade of Buckingham Palace, erected in 1846, in the opinion of Mr. Gwilt, is the most remarkable failure of Caen stone. It is not advisable to employ this stone in situations where water is likely to lodge, or even to be taken up by capillary action, unless the projecting parts be protected by metal. The projections of Mr. H. T. Hope's house in Piccadilly, built in 1850, were protected by lead or slates, and this house is considered one of the best specimens of the employment of Caen stone in London, as it has stood well. In upright walling above the plinths and in the sheltered portions of the cornices, this stone may be employed when judiciously selected, and in internal work with safety and economy. In Caen itself, the basements of houses are executed in granite or Crenilly stone, which is particularly non-absorbent. Sea air is particularly destructive to Caen stone.—M. M.

[738.]—MILK OF WAX VARNISH may be thus prepared:—Melt in a porcelain capsule a certain quantity of white wax, and add to it while in fusion an equal quantity of spirits of wine of sp. gr. 0·830; stir well and pour it on a large porphyry slab. The granular mass is to be converted into a paste by the muller, with the addition from time to time of a little alcohol. As soon as it is sufficiently smooth and homogeneous, water is to be introduced in small successive quantities to the amount of four times the weight of the wax. The substance is to be then passed through canvass to separate any particles imperfectly incorporated. The varnish thus prepared should be spread over the surface of a painting, allowed to dry, and then fused by passing a hot iron over the surface. When cold, rub with a linen cloth to bring out the lustre.—X. X. X.

[739.]—LIZARD AND FROG.—Batrachus and Saurus were two architects of Laconia. The name of the first signifies a frog, and that of the second a lizard. They perpetuated their names on many of their works by the allegorical representation of these animals sculptured upon them. The churches of St. Eusebius and St. Lorenzo fuori le Muri, at Rome, still contain some columns whose pedestals are sculptured with a lizard and a frog, and they are probably the subjects of Philo's sketches.—POLLIO.

WAGES MOVEMENT.

The operative masons of Halifax have sent a six months' notice to the masters that they will require an increase of 2s. per week.

The master builders of North Staffordshire have given notice of a slight increase in the working time of their men, thus deviating from a mutual arrangement entered into by arbitration in May last. The men have determined to retain the present code of rules by every legitimate means in their power. By a subsequent resolution they have empowered delegates to settle the dispute to the best of their judgment.

The labourers, two hundred in number, employed in excavating the ground for the construction of the new graving dock at Limerick, for which the Treasury has granted £20,000, have struck for an advance of wages, from 9s. to 12s. per week.

At Chester, the journeymen painters having given notice to their employers for an increase of wages, to commence in three months, the officers of the Local Association of Builders are arranging to take the matter into consideration.

The Association of Operative Plasterers at Bath have given notice to the masters, demanding an advance of wages to 28s. per week, to commence from the 2nd of May. Two of the masters have sent answers to the Association, refusing compliance with the request.

STATUES, MEMORIALS, ETC.

Two monuments are to be erected on the battle-fields of Alsen and Duppel to commemorate the Prussian victories in the late Danish war. The style of both will be Gothic, somewhat after that of our Eleanor crosses, and they will be each about 60ft. high. The one at Duppel is to cost about £5,800, and that at Alsen about £4,500. Both are to be executed in sandstone, and will be embellished with figures representing various branches of the service.

A monument to the memory of Alexander Smith, the Scottish poet, has been erected in Warriston Cemetery, Edinburgh. It is in the form of an Iona, or West Highland Cross, 12ft. high, set in a square base 4ft. high. In the centre of the shaft is a bronze medallion of the poet, by Mr. W. Brodie, R.S.A. The shaft and cross are elaborately carved. In the centre is a large boss, and the four arms are covered with Scottish thistles. A harp, crowned with a poet's wreath, is sculptured on the upper part of the shaft. The work has been executed by Mr. John Rhind, sculptor, from the design of Mr. James Drummond, R.S.A.

A statue of the late Prince Consort is about to be erected in the People's Park, at Hull. The requisite funds are being raised by public subscription. A marble statue, by Earle, of Her Majesty, already adorns the park.

LEGAL INTELLIGENCE.

NUISANCE FROM SMOKE.—The plaintiff (Crump) is the owner of two houses at Walsall, and occupies one of them. The defendants (Lambert) had recently erected a factory on land adjoining the plaintiff's property, where they smelted iron for the purpose of their business, and also employed a considerable number of men in hammering iron bars. The plaintiff alleged that the smoke and effluvia issuing from the chimney of the manufactory, and the sound proceeding therefrom, were a nuisance, and he instituted this suit to restrain it. The Lord Chancellor held (affirming the decision of the Master of the Rolls) that the nuisance arising from smoke alone, unaccompanied by noise, or from noise alone, or effluvia alone, might be the subject of substantial damages to a plaintiff in an action at law, and that, wherever a jury would give substantial damages in respect of any such causes of action, the Court of Chancery would grant an injunction to restrain a continuance of them. The injunction in this case was, therefore, made perpetual.

A HOUSEOWNER'S LIABILITY.—At the Manchester County Court, on Monday, before Mr. E. Ovens and a jury, Mr. Thomas Lomas, corn merchant, Ardwick, sued Mr. William Smith, of Bowdon, for £50, being the amount of damage done to a cottage in Melbourne-street, Rochdale-road, and expenses incidental thereto, by excavations made upon the adjoining premises of the defendant. Mr. Corbett, of the firm of Corbett and Raby, surveyors, said that, in consequence of deep excavations made in the cellar of the defendant's house, and the raising of that house two additional storeys, there had been a subsidence of the ground, causing the gable wall of the plaintiff's cottage to bulge and other walls to crack. The tenant in consequence left, and the cottage was let at a lower rent. In addition to the actual cost of the repairs a claim was made for damage to light and air by the building of a wall. Mr. Corbett said there must have been negligence on the part of the defendant's contractor or workmen to have caused the subsidence complained of.—For the defence Mr. Bird, architect, was called. He said the plaintiff's cottage was 30 or 40 years old. A sewer made by the Corporation in a passage 4ft. wide separating the properties of the plaintiff and defendant had weakened the foundations, causing a subsidence, which had been increased slightly by the defendant's excavations. The damage complained of was unavoidable; but 10s. would have been sufficient for its repair.—Mr. Thomas Taylor, architect, also described the damage as insignificant.—The jury returned a verdict for the plaintiff; damages, £9 5s. 9d.

SINGULAR DECISION.—BROWN V. TRUETT.—This case was tried at the Bow County Court on Friday last, before J. B. Dasent, Esq. The plaintiff, a builder, sought to recover the sum of £4 16s., being the balance for extra works in connection with certain alterations to defendant's premises at Limehouse. The contract sum was £158, the extra works amounted to £14 16s. The defendant had paid the builder £168, being the contract amount, and one of the items of extras, but denied his liability to pay the others, although the fact of their execution was not objected to, upon the ground that his surveyor had not acquainted him during the progress of the works with the fact that any extra works had been ordered beyond the one above mentioned. Mr. Harris, called by the plaintiff as a witness, stated that, in his capacity of surveyor to the works he had seen the advisability of having these extra works executed, and had consequently, on defendant's behalf, given the orders (verbal ones), and had subsequently certified the builder's account. He also produced the contract, which specified that "the works were to be carried out according to the plans and specification signed by the parties thereto, or according to any alterations or additions which should be from time to time set forth in writing by the surveyor and delivered to the said Charles Brown;" another clause also provided that the surveyor shall arbitrate and settle any difference or dispute that might arise between the parties in relation to the contract, either as to the quality of the work, or payment for the same. His Honour decided that the plaintiff not having written orders for the extra works, as provided by the contract, was not entitled to recover. Verdict for defendant accordingly.

It is stated that Mr. Clutton will be the architect of the Roman Catholic Cathedral to be erected in Westminster.

COMPENSATION.

THE DUKE OF BUCCLEUCH V. THE METROPOLITAN BOARD OF WORKS.—This was an important action before the Lord Chief Baron, and a special jury in the Court of Exchequer, to enforce payment of a sum of £8,325 as the amount of compensation awarded to the Duke of Buccleuch, by the decision of Mr. Charles Pollock, Q.C., to whom the case had been referred as umpire, in consequence of the injury done to his occupation of Montague House, Whitehall, and the depreciation of the value of his interest in the property by the construction of the Thames Embankment. The case presented a number of points of considerable interest. The claimant had demanded a sum of £10,000, and one of the surveyors examined on his behalf had assessed the injury to the estate at £18,000. However, the compensation having been thus assessed by the umpire, the Metropolitan Board refused to pay the money upon the ground that the umpire had been influenced in making his assessment by taking into the account items of calculations which were not properly admissible. For example, compensation was allowed because of the annihilation of a certain jetty extending into the bed of the river from the garden wall, by which the occupants of the mansion had been in the habit for many years of receiving the family washing, ice, and fruit in transit by the river from the duke's residence at Richmond, and likewise coals. It was contended, first, that the claimant had no right by way of easement to the use of the jetty; and, secondly, if he had, that its destruction was not matter for a compensation in money, but the board should have been compelled to make a fresh jetty. In the next place, it was endeavoured to be established that the umpire in awarding the amount of compensation had taken into account that the claimant's view of the river from the lower windows of the mansion would be interfered with by the creation of a roadway along the embankment, and that the value of the property was proportionately depreciated, and such interference with a prospect did not form a foundation for a legal claim, and consequently if the umpire had been so influenced his assessment was wrong. Mr. C. Pollock, Q.C., on being called as a witness, said that the claimant held under a lease granted to him by the Crown in 1854, for a term of ninety nine years, at a rent of £800 a year, in consideration of an expenditure of £20,000 on the building of a mansion. (Counsel stated that £100,000 was the amount actually expended). In arriving at a conclusion as to the amount to be awarded as compensation, he had assessed the loss of the jetty at £200, the structural damage to the walls of the mansion at £50; the capitalised rent of the garden to be created by the appropriation of the land at the disposal of the board between the roadway and the present terrace of the mansion, supposing his grace disposed to lease it from the board, £2,475. Next, the expense of laying out the garden he put down at £600; and, lastly, he assessed the depreciation in the letting value of the mansion at £5,000. In arriving at a conclusion as to the depreciation in the value of the mansion consequent upon the formation of the embankment, the learned umpire would not allow that he had been influenced by the idea that the prospect from the house would be interfered with. He had considered, however, that its privacy would be, and that was a consideration of great weight with many people, and he had also taken into account the injurious effect upon furniture and the articles of vertu stored in the mansion, which the contiguity of a great public thoroughfare would cause. A great deal of evidence was heard on both sides. At the close the Chief Baron directed a verdict for the plaintiff, reserving leave to the defendants to move the court above on the points of law argued on their behalf. Amount of award £8,325, interest, £208; costs of award, £356 11s. 5d; total, £8,889 11s. 5d.

MEETINGS FOR THE WEEK.

MON.—Society of Engineers, "On the "Panama Railroad," and the "Darien Ship Canal," by Dr. Cullen, 7 30.

TUES.—Institute of Civil Engineers, "On the Supporting Power of Piles, and on the Pneumatic Process of Driving Iron Columns as practised in America," by J. M'Alpine, M Inst. C E., 8.

WED.—Society of Arts, "On the Supply of Animal Food to Britain, and the means proposed for increasing it," W. L. Scott, F.C.S.

SAT.—Associated Arts Institute. "On some Thought and Experiments in Reference to a theory of Colour," by U. C. Thomas.

Our Office Table.

The Irish papers state that the Treasury has granted £100,000, for the purchase of the Exhibition Palace, the site for the Royal Irish Institute of Art; also similar sums for the improvement of Cork harbour, and for the construction of a harbour in Belfast Lough.

It appears that the Vestry of Bermondsey having been put to the expense of £150 in repairing stones in front of the public-houses in their parish, have come to the determination to prosecute all draymen known to land their butts on the street pavement. The Vestry offers a reward of 5s. to any person giving information which shall lead to a conviction.

We are requested to state that the voluntary architectural examination (Royal Institute of British Architects) will be held in the second and third weeks of May. Applications for examination and all preliminary work must be delivered on or before 31st March next. The examination of the present year will be held, if the application of even one candidate be approved by the council. Copies of the regulations, &c., may be had of the Assistant Secretary at the Institute.

Though not finished, the new Opera-House at Paris narrowly escaped destruction by fire on the 19th ult. The fire broke out in one of the couloirs leading to the salle, and was caused, it is presumed, by a stove chimney, which serves to heat the ateliers of the modellers. It was fortunately speedily extinguished by the pompiers.

One of the late uses of paper is its application in the manufacture of pails, wash-basins, pans, spittoons, &c., by the American Papier Maché Manufacturing Company, of Greenpoint. The paper from which these articles are manufactured is rendered impervious to the action of water or acids; the utensils can be placed in an oven till the water will boil in them; placed in the sun at the hottest season, or exposed to the severest cold, without the slightest effect on them. Where wood would rot and iron rust, these articles are unaffected, and with proper usage would be as good as new. In pails there is an advantage, that water will not taste of the material and will never soak, and they will not fall to pieces; they are lighter than the wooden pail, and, being a non-conductor of heat, will keep water cool. The articles are coated with a vegetable composition, which, even if it does wear off, does not affect their durability, or injure them, except in appearance.

The Somerset Archæological Society will hold its next annual meeting at Williton, in September, under the presidency of Sir A. A. Hood, Bart., M.P.

At a meeting of the Worcester Archæological Club, last week, Mr. Binns was re-elected president, Mr. B. Woof, vice-president, and Mr. J. Severn, secretary. A paper on "The traditions of Worcestershire" was read by Mr. Edwin Lees. Mr. Baxter exhibited a rare specimen of Worcester book-printing in the shape of a Prayer-book, printed in 1552, by John Owen, who lived in High-street. The book belongs to the Chapter library.

It is mentioned by the "Pall Mall Gazette" that the cost of distilling water at Annesley Bay, Abyssinia, is 2s. a gallon, and the daily needs of the men and animals collected there average 40,000 gallons a day. Therefore, the water supply alone of that station is costing the British taxpayers at the rate of £1,520,000 a year.

A fire, which nearly resulted in the destruction of St. Nicholas Church, Liverpool, the other day, appears to have been occasioned by an act of gross negligence. A number of plumbers, who were employed in repairing the lead on the roof of the church, incautiously left a quantity of lighted charcoal in a grating used for the purpose of melting lead. Some of the coal fell upon the roof, which became ignited, and the fire speedily extended to the rafters and spread rapidly. The roof being a ceiled one acted as a sort of flue for the fire. Nearly the whole of the north portion of the roof has been destroyed, and the organ has also been completely damaged. The casualty furnishes a warning to thoughtless workmen.

A curious fact has transpired with regard to the effects of pipe-clay on human life. A fine young fellow, named Soloman, a bandsman, died at Aldershot last week. He had complained very much respecting the constant use of wet pipe-clay to his tunic, which always gave him cold, being obliged to wear it sometimes wet, not having time to dry it for duty; and also of the constant dusting of the tunic to take out the pipe-clay, as being bad for the lungs. This case has led to the suggestion that the fashion of having white tunics in the service for our bandsmen might well be done away with.

Tenders are advertised for the erection of new National Schools at Tynemouth, and several improvements are intended to be made in "the Brighton of the North," in the course of the spring, to make it more attractive to the crowd of visitors who throng its beach, pier, and promenade every summer.

During the last ten days the Camden Town Omnibus Association has worked with complete success a patented system of issuing tickets to all passengers on one line of their conveyances. The public, by this arrangement, are protected from overcharge in the payment of fares; and in the event of leaving property behind in an omnibus, the numbered and dated ticket materially facilitates recovery. Another result, it is said, is a considerable increase of the earnings which find their way into the company's treasury. It is under consideration to have the conductorship filled by commissionaires.

Dean Milman is engaged in writing the "Memorials of St. Paul's Cathedral." The work, we believe, will be of a similar character to Dean Stanley's interesting "Memorials of Westminster Abbey."

The iron framework of the Paris Exhibition building was sold on Saturday last for £60,000, to a society of contractors and builders. The "Figaro" remarks that the building has taken more time to disappear than to construct.

Mr. Laffin, a provincial architect, was recently employed by the Belgian Government to execute some works at the ruins of the castle of Creve-Cœur, rendered necessary in consequence of recent giving way of the soil and masonry. In the course of the work he discovered some mines, placed there it is supposed by the troops of Henry II. of France, when, under the command of the Duke de Nevers, they besieged the town on the 7th July, 1554. The earthbags containing the gunpowder are reduplite decayed, and the pieces of wood laid around them are almost intact. The supposition is, that the intention was to blow up a portion of one of the conical towers which is still standing, and from the top of which, as the story runs, the three ladies of Creve-Cœur threw themselves into the Meuse.

People are laughing at a rather characteristic anecdote of the Bishop of Oxford. It is said that Mr Alfred Pye has been employed to design a gateway for the palace of Cuddesdon; and when it was finished, the Bishop liked it so much that he suggested placing his own initials over one pillar, and those of the architect over the other. But when it was proposed to put "S. O." on the right column and "A. P." on the left, the Prelate objected that that would never do, as it palpably spelt "Soap."

The United States' Statistical Bureau, attached to the Treasury Department, reports that there were in that country at the close of 1867, 54,325 miles of railways, of which 38,005 miles were completed, and the aggregate cost of the roads and their equipments was 1,651,050,799 dollars. Pennsylvania is the leading railroad State, with 4,192 miles completed, costing 221,947,857 dollars. Ohio has 3,397 miles; Illinois, 3,221; New York, 3,182; and Indiana, 2,306 miles.

A special general meeting of the Royal Scottish Academy of Painting, Sculpture, and Architecture, was held in the Academy Library, at Edinburgh, on Monday, to supply from among the Associates a vacancy in the list of the Academicians, caused by the decease of the late Horatio Macculloch, Esq., R.S.A.; when Mr. Arthur Perigal was duly elected.

The report of the Paris Exhibition Architectural Committee will be presented to the meeting of the Royal Institute of British Architects on Thursday evening next, by Mr. Beresford-Hope, M.P., the chairman of the committee. Mr. George Grove will afterwards read a paper on "The Exploration of Jerusalem and the Holy Land."

So many diverse opinions have recently been expressed with regard to the solution of the problem of the education of the working classes, that the Council of the Society of Arts has resolved to call a meeting of the leading representative men of those classes in order to ascertain their views upon the question. The meeting, or rather conference, will be held on Wednesday, the 4th of March, in the great room of the society at John-street, Adelphi.

Another public meeting has been held at the Shoreditch Townhall for the purpose of adopting measures for obtaining an equalization of the metropolitan poor-rates. The vicar of St. Leonard's, Mr. Samuda, M.P., Mr. Ayrton, M.P., Colonel Thompson, and the Rev. Septimus Hansard, were among the speakers. Resolutions declaring that the present system of rates, by which an undue share of the burden is cast, with crushing effect, upon the poorest parishes and ratepayers, is impolitic and unjust, and that an equalization of the whole charge of the maintenance of the poor is an urgent necessity and a just demand, were unanimously adopted, and a deputation was appointed to wait on the Poor-law Board, to represent the opinions of the meeting.

To-morrow evening, at the Metropolitan Association of Medical Officers of Health, Mr. McCullagh Torrens, M.P., will introduce the subject of a Bill "to provide better dwellings for artizans and labourers," and Dr. Letheby will read a paper on the Cholera Epidemic of 1866.

Though there have been fifty-one fires at theatres since the year 1835, only eight theatres have been burned down, including the recent destruction of Her Majesty's. Most of these buildings, too, had paid much more than their value in fire insurances, and one theatre in particular had paid in premiums a sum which, at interest, would have amounted to four times what the insurance company had eventually to pay. Of these fifty-one fires, eighteen were caused by gas; of sixteen the causes were unknown, and four arose from smoking tobacco. Yet of all these fires forty-three were harmless.

Many months ago we called attention to the condition of the Cobden Memorial at Camden Town. We remarked that everybody wondered when it was going to be finished. The wonder now is whether it will ever be finished. The forlorn pedestal on which the statue of the great Free Trader is intended to rest is fast becoming dirty and soot begrimed, and will be anything but a pleasant or appropriate object when the prospective inauguration day arrives. The ragged-looking hoarding which surrounds it has, of course, been turned into an advertisement stand, for which its position admirably adapts it. We can only hope that the St. Pancras authorities are making a good thing out of it for the benefit of the unfortunate memorial. But, really, something ought to be done to have the monument completed. The whole affair is very discreditable to everybody connected with it.

Mr. F. C. Sumichrast Roussy, F.E.I.S., has been exhibiting to the Scottish Architectural Association, Edinburgh, a collection of photographs of the pictures in the Dresden Museum. The photographs, most of which were taken direct from the original paintings, are 350 in number, and report states that they are finished in a highly artistic style, all of them being choice pictures. Among the photographs which attracted most attention at the meeting were the —"Madonna di San Sisto," of Raphael; "The Madonna and Child," of Murillo; the "Portrait of a Young Woman," after Rembrandt; "The Fortune-teller," of Mieris; and "The Tribute Money," after Titian.

At the meeting of the British Archæological Association on Wednesday evening, Mr. J. R. Planché in the chair, Mr. Holt exhibited an exquisite carving, by Albert Durer, representing the visitation of the Virgin, executed in 1494. This was carved out of a piece of mahogany brought over on his first voyage by Christopher Columbus, and given by him to his friend Martin Boehm, of Antwerp. Martin left it in the care of his brother John, at Nuremberg, who was a friend of Albert Durer's. John Boehm gave it to Durer to carve for him, and it afterwards formed a part of the collection of Mr. Heinlein, passing afterwards through two other hands into the possession of Mr. Holt. Mr. Gordon M. Hills gave an account of a new work on Irish round towers, by Mr. Marcus Keane, which, he said, was an addition to the confusion and mystery already spread over the subject by Irish antiquaries. Mr. Holt also exhibited a silver medal of Martin Luther, by Albert Durer. Mr. Cuming read a paper on Roman bronze statues found in London, and exhibited a hand found in Gracechurch-street, which he judged to have been of the first century. The meeting adjourned to the 26th inst., when Mr. Ralph Carr is to read a paper on the St. Cadwan stone; Mr. G. M. Hills, one on Roman remains at West Hampnett Church; Mr. Vere Irving on the seals of Lanark; and Mr. J. W. Grover on the Roman villa at Chedworth.

Speaking of the Manchester Townhall competition designs, a correspondent says:—Two of the designs have been imported from Paris, and drawn and finished by Frenchmen. As a political economist, don't you think they should be rattened? Scott's lot is high in the market, odds freely taken for place. Only one design will be Italian, or perhaps two, but the flat has gone forth that Gothic is to win, in fact the Mayor says so.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

1739 S. TUDDENHAM. Improvements in the Construction and Manufacture of Iron or Metal Rail Rods or Bars for Balconies. Dated June 14, 1867.

The patentee claims, first, producing ornamental bars or rods of the kind mentioned in the title by twisting prepared bars or rods having their surfaces so prepared or ornamented as to produce a twisted bar or rod of a given ornamental section or surface, as described. Second, the use of machinery constructed and arranged as described for the purpose of twisting metal bars.—Patent completed.

1745 J. QUIN. A New or Improved Fire Escape. Dated June 15, 1867.

This apparatus consists of a support and ladder. The support is constructed of a rectangular horizontal frame, similar in principle to the boards used by painters, which rests on the window cill or frame, and is formed of strong iron bars strengthened by cross pieces. To the two side bars of this frame are fixed two longitudinal pieces or bars to form guides or slides for receiving in a suitable position two vertical iron bars, adjustable at any part of the guides by means of pins attached to chains, and passing through holes in the guides and vertical bars or uprights.—Patent abandoned.

1761 J. H. JOHNSON. Improvements in Wood Screws, and in the Means Employed in their Manufacture. (A communication.) Dated June 17, 1867.

This invention relates, first, to wood screws, and particularly to those known as gimlet-pointed screws, and consists in forming in the shank of the screw one or more longitudinal grooves, flat sides, or indentations, which extend upward from the point of the screw, and are transverse to the thread of the same. The second part of this invention has reference to the tools for cutting the threads on the improved or other wood screws, and consists in the employment for that purpose of a cylindrical or other suitable curvilinear form of tool, whether a complete cylinder or only a segment of the same.—Patent completed.

1790 J. COPPARD. Closing of Doors, Windows, and other such Apertures with a Spring, when necessary to Close them by such Means. Dated June 19, 1867.

This invention consists in making a ring made of india-rubber or other elastic substance as a substitute for the ordinary spring used for the purposes mentioned in the title, which said springs may be either round, square, or flat; but the patentee prefers them flat.—Patent completed.

1800 F. G. N. PERRETT. The Self Regulating Balance Blind Pulley. Dated June 20, 1867.

In performing this invention the patentee passes a cord over the wheel or sheave of the curtains or roller blinds in the ordinary way, and then passes the same under a wheel, roller, or sheave fixed at the upper end of a balance weight of any required shape or size enclosed in an outer case of metal, this outer casing being made open at both ends, so that the weight can work up or down through the same, and by its weight alone retain the curtain or roller blind cords at one uniform tension.—Patent completed.

Trade News.

TENDERS.

BARNET.—For house at Barnet. A. Rowland Barker, architect:—

Smith and Son	£1,248 10 0
Brown and Son	1,165 0 0
Scrivener and Stephenson	1,160 0 0
Stringer	959 16 4

BRIXTON.—For building two houses and shops in the Brixton-road, S., for Messrs. Nicholls and Sainsbury. Mr. C. H. Driver, architect. Quantities by Mr. R. O. Harris:—

Nixon	£4,448
Maxwell	4,018
Manley and Rogers	3,948
Taylor	3,897
Jackson and Shaw	3,837
Axford	3,790
Thompson	3,770
Perry	3,635
Nutt and Co. (accepted)	3,440

CAMBERWELL.—For repairs to thirty-nine houses in Albany-road, Camberwell. Mr. Lewis H. Isaacs, architect:—

Cohen	£1540
Simpson and Son	1384
Langmead and Way	1375
Butler	1360
Phillips (accepted)	1287

IVYBRIDGE.—For Independent Chapel, at Ivybridge, South Devon. Messrs. Ambrose and Snell, architects, Plymouth:—

Condy, Brothers	£950
Brimblecombe and Triggs	800
J. Brimblecombe	757
Marshall	742
Hurrell	736
Jenkins	729
Clarke	717
Dyer	715
Crispin	705
Channon	685
Cornish	640

LONDON.—For alterations, &c., to Nos. 1 to 8, Winchester-court, Monkwell-street, for Messrs. James and Williams. Mr. B. Tabberer, architect:—

Bostel	£1,338
Palmer and Son	1,229
Heaven	1,150
Prince	900
Larke (accepted)	874

LONDON.—For building two houses at Stratford New Town, for the Temperance Building Society. Mr. William Price, architect. Quantities supplied:—

Nightingale	£425 0 0
Perkins	419 0 0
Snowdon	356 10 0
Wheeler	338 0 0
Pierce and Booth	320 0 0

LONDON.—For building new workshops in Griffin-court, Shepherd's market, for Mr. Wolmershausen. Mr. Joseph S. Moye, architect:—

Foster	£735
Sapwell	728
Fish (accepted)	690

LONDON.—For a Factory and Stables in Peckham-grove, Camberwell, for Mr. Jones. Mr. Coe, architect. Quantities supplied:—

Larke	£785
King and Sons	760
Batchelor	739
Johnson	719
Shapley and Webster	673
Smith	658
Mortar	654

LONDON.—For erecting Tavern and Shop in Old-street, St. Luke's, for Mr. A. Bowden. Mr. J. T. Rill, architect:—

Brown	£3,307
Chesman	3,134
Sabey	3,049
Perry	3,016
Moreland and Burton	2,995
Rivett	2,953
Webb and Sons	2,769
Enner	2,651
Henshaw	2,629

LONDON.—For proposed New Workhouse for the parish of St. Mary, Islington. Mr. R. H. Burden, architect:—

Heath	£98,000 !
Hill and Keddell	80,073
Simpson	79,950
Foale	79,600
Piper and Wheeler	79,100
Kirk and Parry	78,730
Jackson and Shaw	78,850
Patman and Fotheringham	76,596
Higgs	76,350
Palmer	74,360
Myers and Sons	74,280
Manley and Rogers	73,510
Carter and Son	73,385
Mansfield and Price	72,347
Mansbridge	72,269
Bracher and Son	70,500
Perry	69,875
Executors of John Adams	69,194
King and Sons	68,885
Hart	68,793
Webb and Sons	68,350
Lacey and Flaxman	66,476
Henshaw	66,400
Nutt and Co.	61,800
Sawyer	43,586 !

PLYMOUTH.—For two houses in Notte-street, Plymouth. Messrs. Ambrose and Snell, architects:—

Finch	£946
Gloyn	910
Condy, Brothers	825
Clarke	815
Verren	795
Elford	791
Channon	787
Marshall	785
Call and Pethick	769
Elliott	768
Price	759

Slade	705

PROPERTY SALES.

AT THE MART.—By Mr. Haynes.—Leasehold residence, No. 29, Devonshire-road, Hackney, let at £30 per annum, term 79½ years unexpired, at £5 per annum—sold for £285.

FEB. 5.

AT THE MART.—By Messrs. Rogers and Chapman.—Leasehold residence, No. 59, Gloucester-street, Warwick-square, annual value £80, term 64 years unexpired, at £8 10s per annum—£490.

Leasehold residence, No. 6, Denbigh-place, South Belgravia, let at £60 per annum, term 79 years from 1848, at £9 per annum—£645.

FEB. 6.

AT THE MART.—By Mr. C. S. Barker.—Leasehold house, No. 50, Sharsted-street, Kennington Park, annual value £40, term 99 years from 1865, at £6 per annum—£350.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Thomas Baldwin, Ann's Terrace, Cambridge Heath, builder, February 25, at 11—Robert William Bell, Tring, builder, March 2, at 12—William Miller, Lewisham, builder, March 2, at 12—George Prince Vallas, Bayham-street, Camden Town, plumber, February 25, at 2—Thomas Bryant, Bromley, Kent, builder, February 25, at 1—George Hutt, Walbrook, and Brentford, iron merchant, February 26, at 12.

TO SURRENDER IN THE COUNTRY.

Henry Barrett, Bradford, painter, February 18 at 9.15—George Button, Hull, engineer, February 18, at 11—Christopher Coney, Bournemouth, builder, February 21, at 11—Daniel Coleman Field, Broadwater, Sussex, carpenter, February 22, at 11.45—Thomas Groves, Appleby, builder, February 21, at 12—Hugh Prichard, Leeds, engineer, February 18, at 12—Aaron Robinson and Charles Tomkinson, New Wortley, near Leeds, bricklayers, February 24, at 11—Thomas Cox Stretton, Old Basford, builder, March 10, at 11—Robert Williams, Rhyl, builder, February 20, at 11—Myers Abrahams, Dover, glazier, February 22, at 12—Edward Bartle, Great Hortou, painter, February 25, at 9.15—Thomas Watkins Copner and David Allen Jones, Birkenhead, timber merchants, February 24, at 11—John Crake, Southport, joiner, February 22, at 11—Patrick Farrell, Salford, builder, February 27, at 12—John Sanders, Aston-juxta-Birmingham, builder, February 21, at 12—William Stone, Cromford, Derbyshire, builder, February 25, at 11—Robert Williams, Chester, stonemason, February 24, at 11.

BANKRUPTCIES ANNULLED.

William Brooks, Clarendon-road, Notting Hill, builder, February 8—William Hutchinson, Salford, engineer, February 3.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

March 12, C. H. Clothier, Woolwich, builder—March 23, R. Sbortridge, Plymouth, plumber—February 28, R. Foster, Liskeard, engineer—February 27, J. Abbot, Newton Heath, builder—February 19, J. Edmonds, Worcester, builder—February 18, J. H. Milnes, Leeds, plumber—February 18, J. Stafford, Leeds, blue slater—February 18, W. Broughton, Leeds, plasterer—February 18, G. Broughton, Leeds, plasterer—March 11, T. Lewtass, Blackpool, brickmaker—March 16, G. Simpson, Stamford, painter—February 25, T. Richards, Old Basford, bricklayer—February 15, C. G. Allen, New Romney, painter—March 9, T. Johnson, Towcester, bricklayer—February 20, J. Fawcett, Stokesley, plumber—February 21, E. Jenkinson, Skelton, brickmaker—March 9, G. Gaskin, Banstead, builder—March 4, J. Ashworth, Doncaster, painter—March 4, T. Hesketh, Manchester, builder—March 10, R. M. Penn, Blakeney, carpenter—March 3, J. Scott, Halifax, joiner.

DIVIDEND.

February 27, H. J. Ledger, Hulme, builder.

SCOTCH SEQUESTRATION.

John Masson, Dunbar, land surveyor, February 19, at 12.

PARTNERSHIPS DISSOLVED.

Whittle and Platt, Wrightington, Lancashire, stone merchants—Carr and Co., Allerton and Hove Edge, Yorkshire, stone merchants—The Tyne Asphalte Company—Bavington and Co., Hauley, parian manufacturers—Chaplin and Co., Dowgate Hill, and Weston-super-Mare, contractors—Frodingham Iron Company.

DECLARATION OF DIVIDEND.

J. Thomas, Bicester, builder, div. 1s. 7½d.

10,000 BUSHELS HYDRAULIC PLASTER now READY for SALE. Apply as above.

THE BUILDING NEWS.

LONDON, FRIDAY, FEBRUARY 21, 1868.

THE PUGIN-BARRY PAMPHLETS.

WHEN the good-natured Sir Roger de Coverley was pressed by a pertinacious bore to give his opinion, unwilling to offend and unable to agree, he remarked, that "much may be said on both sides." The pamphlet of Mr. Pugin, published November, 1867, against which an injunction was immediately obtained, has at length been permitted to circulate simultaneously with the reply of the Messrs. Barry. The public are, notwithstanding, still left at liberty, nay, perforce compelled, to come to the conclusion that, in spite of all that has been advanced, much may yet be said on both sides. In the BUILDING NEWS of November 15, 1867, the pamphlet of Mr. Pugin was noticed at some length. It contained our views of the controversy, as far as it had gone, in the daily and weekly press, and it certainly seemed, unless the *ex-parte* statements of Mr. Pugin could be broken down, his case was a good one. The matter in dispute —namely, who was the art architect of the Houses of Parliament?—has by both sides been submitted to the verdict of the public. What that verdict will be time alone will show; this much, however, is certain, the friends of the Messrs. Barry will hold with them, and the admirers of Mr. Pugin will cleave to him, both parties paying their own expenses without leave to appeal to a higher court. In thus appealing to the public rather than to the profession, Mr. Pugin has shown sufficient discernment, although he offered to leave the matter to professional arbitration, if his missing documents—in short, his principal witnesses—were produced by the other side, in whose possession he implied them to be. To this point allusion will presently be made. The Messrs. Barry exhibited at least equal astuteness in insisting on terms which they knew Mr. Pugin would not accept. They insisted on arbitration. He demanded his papers; a deadlock ensued; hence the appeal to the public. Mr. Pugin's courage, or rather his confidence in his cause, must have been of no ordinary kind when he agreed to submit the matter to the Council of the Institute. His father's case would not have been tried by his peers. That he knew the disadvantages under which he laboured is evident when he says:—"I would not now shrink from fighting single-handed, if need be, against men whose possession of inherited honour, position, and patronage, *is alone sufficient to hold back witnesses from my side.*" Those who are conversant with the extreme difficulty of getting the truth out of unwilling witnesses, whether in the Court of Chancery in England, or the court of Judge Lynch in the colonies, will allow that it was a bold thing to confide his cause to a tribunal without jurisdiction of any kind, without power to compel the attendance of persons or the production of papers, without even the power of administering an oath, or putting a witness on his word of honour. Yet this was what Mr. Pugin did, upon the sole condition that his papers were returned to him. So much for the cause of the appearance of the pamphlet—now to the manner of its appearance.

Mr. Pugin has been blamed by many for want of taste, in bringing forward his father's claims at this late hour. This charge of want of taste is a very convenient one, and is often used to put down a young, a poor, or an ill-used man. The prosperous and firmly seated of the community have an instinctive horror of the man who knows the rottenness of the lower rounds of the long kicked-away ladder by which their position has been attained, and, if his facts cannot be gainsayed, his taste, forsooth, is called in question. There can be no doubt that Mordecai showed uncommonly bad taste in refusing to be polite to the well-to-do Haman, but his ultimate elevation was the consequence. As long as human nature remains what it is, so long will want of taste be laid to the charge of those who simply want justice, which it is inconvenient to bestow. Those who read the "personal explanations," some sixteen pages which form the preface to the pamphlet, will see that he had good reasons for keeping silence so long. When his father died he was under eighteen years of age: what could a youth in his teens expect to do against one whom he thought to be a wily antagonist, one who had certainly kept aloof from his family during their affliction, had refused to take him into his office, and whose manifest desire seemed to point to a cessation of all intercourse? That this was Sir C. Barry's desire we do not assert, but there is a certain pathos in Mr. Pugin's statement, which assures us that he at least thought so. Rightly or wrongly, but in fulfilment of what he thought a sacred duty, he waited his opportunity. That opportunity did not come during the lifetime of Sir Charles, and for a certain period after his decease he felt it would be indelicate to intrude his cause on the public. With what may have been his real reasons for delaying for so long a period the vindication of his father's memory we have nothing to do. His own statement, while it affords reasonable grounds for thinking that he acted without *arrière pensée*, does not preclude the possibility of his having been actuated by merely selfish motives. The exhibition of the drawings of the Law Courts competition was unseasonable, and his comments on the competitors unseemly. In a delicate position he acted with more vigour than discretion, and, though he thereby secured immediate and wide-spread attention, his well-wishers must regret that he has laid himself open to the charge of puffing himself under pretence of vindicating his father's memory. That this idea entered his head we are far from asserting or implying, but the unfortunate selection of time and opportunity has given this handle to his adversaries. He has entered the lists of his own free will—if the public spy a defect in his harness and attack him in that point he has no one but himself to blame. The public are his judges: for our own part we are neither judges nor advocates.

So much for his motives—now for the pamphlet itself. He lays claim for his father to the design of the "elevations and all details;" and in this he has gone too far, though, perhaps, unintentionally. To those who know anything of the works of Barry and Pugin it must seem that the outline and general disposition of elevation is Barry's and not Pugin's. The symmetry of the parts must have been as abhorrent to the one as they were dear to the other. It is a Gothic building, designed with an Italian feeling, and Pugin had no Italian feeling whatever. At the same time the details show a good knowledge of the Perpendicular style of architecture, and are delicately conceived. They would most probably have been better had Barry not meddled with them, as all his son's eager witnesses are never tired of assuring the reader was his practice. That Barry's judgment and undoubted taste may have prevented Pugin from running into extravagancies is very probable, but that Barry should have advantageously altered a detail is impossible. The one had spent his life in mastering the details of Gothic architecture—the mass he never successfully grappled with; the other had spent his life in a totally different study, and was imbued with the spirit of horizontal lines and the formality of the Classical school. We believe that a true student of Gothic architecture could point out almost every instance where Pugin's or Barry's influence was dominant. That Pugin's position was subordinate, no one doubts, but no one can positively affirm that the work would have been better had he had the entire charge. A zealot of the romantic school was scarcely to be trusted thirty years ago, and it is more than likely that the restraint Barry exercised over Pugin was beneficial to the work. The exact nature of the assistance rendered by the latter will never be ascertained, nor do we think it of any great moment that it should. They are now indifferent to fame. In their lives they were friends and fellow workers, each according to his light, and their joint work is their monument. What gives dignity to the structure is the work of Barry, what gives charm and delicacy is from the hand of Pugin; but it must not be forgotten that the arrangement of a succession of bays was Barry's idea, and that Pugin confesses himself a convert to the idea. As to the evidence which Mr. Pugin adduces, it is in some respects conclusive, but much of it is mere hearsay; and it may be recollected that his extreme youth must have precluded him from being a very reliable witness. His explanations of his father's reasons for writing letters disclaiming responsibility, and stating that he was under Barry's control, must be read in the pamphlet—they are too long for quotation, and should not be mutilated. Whether they are conclusive or no the public must judge. It is certainly unfortunate that Pugin kept no regular diary or copies of letters—had he done so this dispute, if it ever had arisen, would have terminated long ago; much ill-feeling would have been avoided, and many hard words spared. A shifty correspondence would not have been entered into, qualified admissions and unworthy evasions would have found no place in the dealings of either. The fair fame of two men who are dead would not be in question, and their sons would be satisfied in giving honour where honour is due, instead of being more or less obliged to cast obloquy on one side to save the credit of the other. To give merely a synopsis of the pamphlet is impossible in anything like the space at our disposal. Letters without end would have to be quoted and commented on, dates and memoranda compared, evidence sifted, hypotheses examined; in short, an array of work as formidable to the writer as it would probably be tedious to the reader; besides which it has already, to a certain extent, been done in the BUILDING NEWS of November 15 last. With the remark that the pamphlet seems to have been prepared in some haste, we will proceed to examine what the Messrs. Barry say in defence.

As Dr. Alfred Barry edits the pamphlet, which we presume is the joint work of the three brothers, we shall, in alluding to the authors, simply mention his name. This pamphlet is of about the same bulk as Mr. Pugin's, but is more carefully prepared. For many reasons a defence has an advantage over an attack, particularly where cross-examination is not permitted; it may, for instance, be met by direct contradiction on every point, or by proof of error in a few strong or even weak points, and the gravity of these errors may be so strongly urged as to go far to destroy confidence in the other portions of the attack. Again, if the attack has been conducted in an impetuous manner it is wisdom to reply very deliberately, but these are, after all, mere tricks, and are effective only with the superficial reader. When, in addition to these advantages, the defence is conducted by three individuals, each wary and cunning of fence, the difficulties are greatly increased. We must also recollect that few will readily allow their long-accepted beliefs to be upset, and that the Messrs. Barry represent an existing state of things, a comfortable, easy-going, optimist condition upon which Mr. Pugin's imperative demand for what he conceives to be mere tardy justice must have burst like a small Clerkenwell explosion. That a defence was necessary seems to us obvious, though Dr. Barry commences his pamphlet by giving two reasons, and then, curiously enough, a third—why a reply is "almost needless." The first is the "extraordinary lapse of time since the events on which this attack is based, &c." The

second reason is Mr. Pugin's unwillingness to bring his assertions and evidence before a proper tribunal. "Besides these reasons, which might seem to render controversy needless, there is another which makes us reluctant to enter into it. This third which makes him reluctant to enter into it is, that Mr. Pugin "has not been able to carry on the war in one newspaper only," but has gone from paper to paper, and that "this course is clearly proved to be calculated to excite odium against Sir C. Barry and the Institute, but it is as clearly the worst of all methods for obtaining the truth." Now these three reasons for not entering into it strangely enough are neutralized in the eighth succeeding line, by the remark "that it is evidently necessary that the pamphlet should not be entirely passed by, lest it should be thought to be unanswered because unanswerable;" besides which architect's assistants would become too bumptious unless Mr. A. W. Pugin's claims were disposed of. Having given three good reasons for declining the conflict, he enters into it with spirit, calling witnesses, sifting evidence, doing everything, in short, except producing the letters which Mr. Pugin so much covets.

These are, indeed, alluded to, or rather form the subject of the appendix, but we cannot say that the matter is cleared up beyond doubt. It is unlikely that Mr. Pugin would make a direct and deliberate false statement—that he lent seventy-six letters to Sir C. Barry, under promise that they should be returned. It is more unlikely still that he should reiterate the statement. It is quite possible that they might have been accidentally destroyed; and it is quite possible they may have contained nothing that would have been prejudicial to Sir C. Barry's claim to be whole and sole architect. It clearly seemed to us, however, while watching the controversy, that the letters were in existence, and the Messrs. Barry would by no means produce them. If such an idea has got abroad, as it most certainly has, it is entirely the fault of the Messrs. Barry, who scarcely alluded to the letters, except to say that they were the joint property of the correspondents. The letters are destroyed—peace to their ashes. The witnesses that Mr. Pugin could *not* call having been disposed of, we are introduced to the principal witness that he could summon, Mr. Talbot Bury. This gentleman contradicts flatly the statement he was expected to confirm—namely, as to how Pugin was engaged at Salisbury, from September 12 to October 2, 1835. Mr. Pugin is possibly mistaken as to the entries in his father's diary, which was kept in a very loose way, and which seems, in other instances, to have deceived him, and of his own knowledge he can know nothing of many events of which he speaks.

To Mr. Talbot Bury, succeed a cloud of witnesses, old friends of Sir C. Barry, old pupils, old superintendents, old practical superintendents, model makers, modellers, carvers: in short, "Blanche, Tray, and Sweetheart," in full cry on the track of the noble game, to whose hunting it is a privilege to be invited. Some have a strong interest in maintaining their late master's or employer's fame, whence in great measure they derive their own; but some appear to do it in such a manner as to throw doubt on their motives. With one exception they all prove too much: the exception is Mr. Clayton, of the firm of Clayton and Bell. The rest either "damn with faint praise," or eagerly bear testimony to the very subordinate position which Mr. Pugin held, in their estimation at least. This part of the evidence is painful to read; the witnesses may have spoken the truth, but the truth would, in cross-examination, appear very different. The tone of some of the letters is perfectly contemptuous towards Pugin, and, after reading them, one is inclined to wonder why Barry should have kept about him so insignificant and useless a creature. His work, by the witnesses' showing, had all to be done over again, and, if the testimony is absolutely and literally true, Pugin's assistance must have been anything but a help. The evidence must be read in full, as it all bears on the point at issue. Ossa is piled on Pelion, and Pelion on Ossa. If written testimony could destroy Pugin's claim, his case were poor indeed, and his advocate must needs become his apologist. Fortunately for him—for against this written testimony it is not easy to make head—his works remain. The Houses of Parliament were not his only works. Other books he wrote and illustrated, besides caricatures under the name of "True Principles;" and other judges he has than the pigmies who have presumed to estimate his capacity by their own measure. We say no word against Sir C. Barry. We see no tittle of evidence against him. On the contrary, his genius was, in a different line, greater than that of Pugin; his ideas of art were more catholic, in itself a proof of a superior mind; his education better qualified him to produce a really great work, and we are not "ignorant of the extraordinary capacity of growth in his mind." That he was a truly great man must be acknowledged by everyone with the slightest acquaintance with art; but that he was the architect of the Palace at Westminster is contradicted by his early training, his ordinary practice, and, above all, by his previous and not long antecedent works. We cannot see in what respect his memory could suffer if the full extent of Pugin's services were acknowledged—without him neither exterior nor interior would be what they are, and with him neither the finish of the Victoria Tower, nor the improvements in Palace-yard, would be what they are. When comparisons can be so easily made, people will draw their own conclusions. If Mr. Pugin had set bounds to his ambition, and claimed less for his father, he would have gained more. If Messrs. Barry had conceded more it would have been better for their cause. To pooh-pooh or ignore the claims of either of the great men in question is as unwise as it is unjust, and yet the argument has been practically conducted on that line. The representatives of both have appealed to the public; they must now abide the issue.

DEAN STANLEY'S "MEMORIALS OF WESTMINSTER ABBEY."*

THE middle of the eleventh century saw three large churches constructed, two in England, and one in Normandy, whose history, equally with that of their founders, is intimately interwoven with the greatest political changes recorded in the annals of our country. These churches are, first, St. Peter's at Westminster, founded by Edward the Confessor; second, St. Etienne, at Caen, by William the Conqueror; and that of the Holy Cross at Waltham, which owes its existence to the munificence of our last Saxon king. Of these three buildings, only a few fragments remain at Westminster; the abbey at Caen has been more fortunate, for very considerable portions of the Conqueror's work are still in existence; while as to Waltham Abbey, antiquaries have hardly yet ceased fighting over the remains which have come down to our time. At present the question is undecided, but there are very good reasons for believing that a good part of the present nave at least may be attributed to Harold. Equally varied has been their fate in the matter of historians, for while little has been written about Waltham or Caen, Westminster, as might be expected, has almost a redundance of chroniclers, although, curious to relate, several of the most important materials for its history, such as the accounts of Flete and Sporley, the Charters of Salcardus, and the Consuetudines of Abbot Ware, remain still in manuscript. It is really a great pity that in these days of Early English Text societies, Chaucer societies, and Camden societies, some one of them cannot be prevailed upon to publish these documents, so curious and so necessary to a really complete account of our great national monument. The latest historian of Westminster Abbey is no less a person than its Dean, the Very Rev. Dr. Stanley; M. Bouet* has just published a most excellent account of St. Etienne, Caen; but Waltham Abbey still waits for a more careful historian than old Fuller, who, by the way, once held the living.

Now, if we compare the respective books of Dean Stanley and M. Bouet, it is almost impossible to find two things which differ more essentially. The Dean's work, as might be expected, is very eloquent, and, as William of Malmsbury would have said, "adorned with choice flowers of rhetoric." When, however, we peruse it a second time, and look carefully into its contents with our eyes less dazzled with the brilliant periods of the talented author, we shall find that there is very little additional information to recommend it to the student, while, from haste in composition or from some other cause, there are not a few positive errors. It is to be hoped that these will be corrected in another edition, and we may thus have a standard popular account of the abbey, which will interest the general public, and induce the student to continue his researches.

M. Bouet has taken the opposite way—his book is essentially one for the student. The history of the abbey is divided into centuries. Each chapter begins with a chronological table of events relating to the building; then follows the peculiarities of the workmanship of the epoch, such as the tooling of the stones, the pointing of the stones, &c.; and, lastly, we have the author's own observations. As I hope, on some future occasion, to return to the very excellent book of M. Bouet, there is no further occasion to refer to it; and I only do so now to show how very differently two authors can treat similar subjects. In one word, M. Bouet has written for architects and students, the Very Rev. the Dean of Westminster for the public generally.

There is one fact mentioned in the preface to the Memorials which will certainly delight all lovers of the arts, more especially those of the Middle Ages. Those who have read Pugin's "Contrasts" (and who has not?) will remember that he bitterly inveighs against the neglect of our royal tombs; and, if I remember rightly, strongly advocates their restoration.

Of course, we know better now; but how narrow an escape we have had may be judged when we read that, among the estimates of the House of Commons, in 1854, was a sum of £4,700, for the restoration of the royal tombs. "But, in the interval, the subject was more maturely considered by a commission of eminent antiquaries, who decided against any such attempt. It was then thought that their venerable aspect, and the marks of antiquity and of history which they bear, pointed not to reparation, but to preservation." It is to be hoped, for their own sakes, that the report of the commission of eminent antiquaries went one step further than this. It is true that it is desirable to preserve the monuments for their venerable aspect, and for the marks of antiquity and of history which they bear; but have they not far greater claims on us, as being landmarks in the history of art, not to say that some of them are objects of the very highest art, and such that would tax the utmost energies of the best sculptors in this unartistic age to rival in the least degree? Now, all this is apparent to the student, but it is not so well known to the general public, and might, therefore, have well been insisted upon by the author, who goes on to recommend the restoration of the 16th and 17th century monuments, some of which are comparatively inoffensive, while others deserve to be classed

* "Historical Memorials of Westminster Abbey," by ARTHUR PENRHYN STANLEY, D.D., Dean of Westminster. London: John Murray, 1868.

* "Analyse Architecturale de l'Abbaye de St. Etienne de Caen," par G. BOUET. Caen: Leblanc-Hardel, 1867.

with those of the last and present century, which everybody who regards Westminster Abbey as a building dedicated to the mysteries of the Christian religion, and not a Walhalla, would willingly see (at least the most offensive ones) turned out of the place into the cloister which we are told "it has often been proposed should be erected, communicating with the abbey by the chapterhouse, and continued on the site of the present Abingdon-street, facing the palace of Westminster, on the one side, and the College Garden, on the other. Such a building, the receptacle not of any of the existing monuments (which would be yet more out of place there than in their present position), but of the graves and memorials of another thousand years of English history, would meet every requirement of the future without breaking with the traditions of the past." If we are to have a Walhalla it does not very much matter where we have it, so long as the most beautiful building we possess is not used for the purpose. As to the removal of the present objectionable specimens, the Dean, as a Christian Churchman, can hardly be expected to desire the retention of such works as those which are thus described in Neale's "History of the Abbey"—"a fine statue of Britannia seated on her pedestal, her right arm extended and grasping the thunder"—"to reward his heroism, Victory is descending with her wreath and palm branch"—"a figure of Death plunging his dart into the breast of a youthful female, whose shrinking frame is supported by an angel pointing to the joys of heaven"—"a large urn with the figures of Wisdom and Poetry"—"it exhibits a noble figure of Hercules, distinguished by his lion's skin and club, near which is a beautiful statue of Navigation"—"a statue of Fame placing a laurel wreath on the brow of the admiral"—"a medallion of the gallant admiral supported by the infant Hercules"—"on the basement is a majestic figure of Neptune reclining on a sea horse, and directing the attention of Britannia." It would be useless to multiply these quotations, suffice it to say that we meet with death personified by the figure of a youth leaning on an extinguished torch, the club of Hercules, statue of Victory, statues of Health and Longevity, the staff of Esculapius, and the cup of Hygera, a sitting figure of Minerva, History in a reclining attitude, Anarchy in chains, a weeping Genius, Britannia represented in the character of Pallas, Minerva, Hercules, &c., not to mention the very repulsive Nightingale monument. The worst of the matter is, that this sort of thing has been going on until comparatively a late period, for we read of a gallant soldier killed in Scinde in 1841 commemorated by a mural tablet "representing a Roman helmet and dagger on an altar."

It is to be hoped that the day will not be far distant when, at least, these pagan monuments may disappear from a Christian church. If people wish to be commemorated in Westminster Abbey there are plenty of ways in which they may be so, without interfering with the architecture or unity of the building. There are very many windows ready for stained glass. The beautiful southern portals, and, indeed, almost the whole of the exterior, would be the better for careful restoration, or rather rebuilding, for nearly every foot of it has been destroyed. The hinges of the doors, the lectern, the font, the statues on the altar screen and in the southern portals all afford subjects for memorials. A small inscription might be attached, which would tell the intent of the donor and not interfere with the object itself. Such memorials would be far more in harmony with the building than busts or statues in white marble. Under its present accomplished architect and historian Westminster Abbey has gradually resumed its lost jewels. The Eleanor grille (a historical piece of ironwork if ever there was one), displaced by no less a person than the late Sir F. Chantry, has been re-fixed; two of the enamelled shields of the tomb of Edward III. have also been restored to their place; the altar screen has been transmuted from plaster into alabaster; parts of the Confessor's choir have been discovered; also some of the figures of Queen Philippa's tomb; also portions of an unknown slab decorated with mosaic. The last discoveries are portions of the original grisaille glass which once filled the chapel windows, and remains of the terra cotta angels which decorated the high altar of Henry VII.'s chapel, and are the last known works of Torrigiano in England.

If ever there was a period in which a restoration of the southern portals and of the eastern end could be attempted, it is the present. At present we are good imitators—probably the world has never seen an age which has so completely imitated the letter (we will say nothing about the spirit) of a preceding architecture. Fifty years hence we may, perhaps, have drifted into some style of our own—it may produce better or worse works than we have at present—but there is also the chance that our successors may have very different ideas regarding restoration to which we have. At present there are sufficient remains of the original to make a very good restoration, under the direction of a skilful architect.

Nobody doubts the ability of Mr. Scott. The expense of the work would not be very great, for, beautiful as is the design of the portals, it is very far from equalling Chartres or Rheims in the richness of its sculpture. The only difficulty would be with the statuary, still good figure work has been produced (although somewhat rarely) in the present day. Let us hope, therefore, that, before the expiration of the next ten years, the south portals of Westminster Abbey may cease to be the ugliest and most degraded architectural work in London. Such, then, is the building to which Dean Stanley has devoted an octavo volume of 500 pages. I hope to show how he has achieved his task in another article.

W. BURGES.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE ordinary meeting of this Institute took place on Monday evening last, Mr. David Brandon, vice-president, in the chair, when Mr. G. F. Jones, of York, and Mr. E. F. Law, of Northampton, were elected fellows. Mr. C. F. Hayward, hon. secretary to the Paris Exhibition Architectural Committee read the report of that committee, in which some interesting details and statistics were given with respect to the British section of that department of the late Exhibition in Paris, and which we hope to lay before our readers in a future number of this journal. It was announced that the election for the Pugin Travelling Studentship had fallen upon Mr. Charles Heuman, from amongst eleven other candidates.

The paper announced for this evening was "On the Exploration of Jerusalem and the Holy Land," by Mr. George Groves, hon. secretary to the Palestine Exploration Fund; and, as might be supposed, so attractive a subject brought together an unusually large audience, including many gentlemen who have taken an active interest in the researches now being carried on in the Holy City.

Mr. GROVES remarked, that he believed there was very much in the investigations of the society which he represented that was of the deepest interest to the members of the institute, and might be encouraged and supported by them with great benefit to the progress of architectural and archæological art and science. The Palestine Exploration Fund, he said, was founded in 1865, with the object of exploring systematically and exhaustively all the various branches of inquiry connected with the Holy Land. It was known generally that the geology of Palestine was very remarkable, that the natural history and meteorology united the features of the tropical, temperate, and arctic zones, and that the ethnology contained traces of a very large number of successive races. Then, with regard to the connection of the country with the Scriptures, of course, before the correspondence between the land and the document could really be tested and brought out, there must be accurate and detailed maps, with the vernacular names of places and spots very carefully ascertained. It seemed most natural that a country so densely inhabited as Palestine was for many hundred years should abound in material traces of its inhabitants—of their modes of building, their domestic and their warlike arts; but, with regard to every one of those branches of inquiry, it was a remarkable thing that nothing can really be said to have been known in an accurate and trustworthy manner till within the last year or two. Travellers in the Holy Land were not prepared for anything like scientific or systematic observation and record, and they had not the time or money to devote to the task. Not only have we no knowledge of the styles or modes of building of the ancient Jews, but the absolute dearth of the articles of life was truly remarkable. A few coins of the probable date of the Maccabees are all the relics known of the nation. We know that they were a warlike race; that they had pottery, jewellery, metal work, and other arts of life; and yet, strange to say, not a fragment of any of these things exists—not a fragment of gold, silver, or brouze is to be found in any museum of the Western world of which it can be said—"This was the product of the nation of Israel during their prosperous period." We, however, dismiss the subjects of natural science, and even of topography, and consider what the Palestine Fund has done, and hopes to do, in exploring the architecture and archæology of the old inhabitants of the Holy Land.

In the winter of 1865, Captain Wilson, of the Royal Engineers, who had in the preceding year distinguished himself by his survey of the city and environs of Jerusalem, under the orders of the Director-General of the Ordnance Survey, and at the cost of Miss Burdett-Coutts, was despatched to Beyrout in charge of the first expedition. He took with him Lieutenant Anderson, R.E., an able and practised surveyor and photographer. They landed at Beyrout in December, and remained in the country till May, during which time they worked gradually down the country to Jerusalem, fixing the latitude and longitude of the chief points, making more or less detailed explorations at the most promising spots, and ascertaining generally what might be advantageously attacked by future exploring parties. The positive results of the expedition consisted of materials for a map of a major portion of the country north of Jerusalem; 164 photographs, many of them of architectural subjects; and of plans and drawings of about 50 temples, synagogues, churches, tombs, &c. [The illustrations alluded to were distributed in the room for inspection.]

The second party went out in the beginning of 1867, under the charge of Lieutenant Warren, R.E., who is still in Jerusalem; and he might now say we were in possession of materials for a really complete map of the Holy Land. But Mr. Warren's chief results had been obtained in Jerusalem, and it was to them he wished to draw the attention of the institute. Having described the topographical features of the city as it at present exists, and pointed out the various spots on the map, Mr. Groves remarked that, whether the temple occupied the whole or a portion of the area generally ascribed to it was immaterial to his present object, but there undoubtedly was the centre of the art and architecture of Jerusalem and of the Jewish nation, and, accordingly, Mr. Warren directed his attention to the southern wall of the harem area immediately after his arrival. After a little opposition from the Turkish authorities he began to sink a shaft on the face of the hill, 40ft. from the south-east corner; and here he immediately came upon a wall, of the existence of which no one had any suspicion. Descending to the foundations of this wall he discovered that that side of the hill was covered with 60ft. of made ground, so that the depth of the wall of the harem is hidden. The wall at the corner, if bared, would stand about 130ft. high, the masonry of which appeared to be the same below as above ground. A shaft, 40ft. east of the south-west angle, revealed a still greater depth, namely, 87ft. from the surface to the wall, so that the depth at the corner must be 100ft., and the whole height of the wall 160ft. or 170ft. Mr. Warren's last letters described the discovery of the western pier of Robinson's arch, two courses and part of the third of which are standing. It is built with some attempt at economy, with upright piers and long lintels. Between the pier and the wall is a flat pavement probably resting on an inferior arch, and upon this pavement are still lying the vonssoirs of the arch apparently exactly as they fell when the arch was destroyed. The structures which Mr. Warren had come upon in the six

shafts which he has sunk across the valley in the line of Robinson's arch it is presumed can hardly have been portions of the ancient bridge or viaduct—these therefore remain yet to seek, but further north, there is a similar arch called after Capt. Wilson, who has the credit of having first found it or first made it public. Here also Mr. Warren has met with encouraging success. He has found two arches contiguous to Wilson's arch, each arch lower than that east of it, thus implying that they supported a sloping roadway. Underneath will be found with them is a system of tanks and aqueducts, which Mr. Warren is now exploring. As to the intention of these remains it would be premature to speculate until more facts were known, but that these remains existed in abundance and comparatively good state of preservation were facts which he desired to impress upon his audience.

Returning to the south wall of the harem area, Mr. Groves mentioned the fact, that the floor of the vaults which occupy the south east corner is many feet above the level of the rock, which led to the supposition that there may be a second set of vaults below those which are now accessible, Mr. Warren having already discovered a passage 12ft. high, running northward for 60ft. at a depth of 20ft. below the floor of the present vaults, and he was waiting for an opportunity to make further explorations in these vaults, which are very difficult of access. Inside the harem area no doubt they should penetrate before long, and then they would be able to complete the system of sewerage and water supply, and obtain an accurate section of the hill.

The sepulchre or catacomb in which David and the kings of Judah were buried was an object eminently worth searching for. It was the only tomb allowed to be within the walls of the city, and it must have been a very spacious one, since at least twenty persons were buried there from first to last. There could be little doubt it was still to be found under the rubbish of the modern city, and the discovery of where "the city of David" was would be of immense gain in the topography. To the members of the institute as a body, the most interesting question was the light which these investigations may throw on a period of architectural art of which comparatively little has been hitherto known. Herod was eminently a building prince, and Jerusalem was his chief feat. Did he employ Roman architects and builders on his works? and what influence did the climate, the materials, the circumstances, or the traditions of the country exercise on them? These were questions which he took for granted were interesting to the body he addressed, and they could not but receive much light from the investigations which he represented. Of earlier epochs than the Herodian he confessed he dare not say anything. Herod probably demolished what remained of the earlier structures when he began his own work; there might be something still to find, but he could not hope for much from this.

In conclusion, Mr. Groves stated that the committee of the Palestine Fund were about very shortly to consider the desirability of extending and hastening this branch of their operations by sending out more workmen, so that Mr. Warren might be able to attack more points at once: and he ventured to suggest that it would be highly advantageous to the undertaking, and very gratifying to the committee, and would help to give the investigation that national and dignified character to which it had aspired, if this Institute would afford the committee that countenance to its operations and, he would add, that advice which no other was so able to give. Such a step, he added, would also have the effect (which he himself most heartily desired) of removing this most interesting spot—the City of Peace, as its name implied—from the confined arena and bitter conflict of theological debate in which it had hitherto struggled, into the open air and serener sky of artistic and archæological investigation.

The Rev. Mr. SMITH read extracts from letters of recent date received from his brother, a captain in the Indian army, confirmatory of the information communicated by Mr. Warren, and expressing the most hopeful anticipations of the satisfactory results which would attend these explorations.

A discussion took place with reference to the enormous accumulation of debris of rock, &c., in the locality spoken of, and the geological phenomena of the district, in which Mr. Chas. Barry, Prof. Ansted, Mr. Digby Wyatt, Mr. Walter Morrison, M.P., and others took part. A feeling highly favourable to the prosecution of these interesting researches was expressed, to which was added the hope that the publication of the information already collected would give a stimulus in the shape of additional subscriptions towards that object. It was stated by Mr. Groves that the cost of the explorations he had explained had been about £1,700, and the expenditure had been at the rate of about £200 per month. That expenditure, he said, might be doubled with great advantage, and he hoped to see the fund placed beyond its present temporary and spasmodic condition by annual subscriptions, commensurate with the importance of the objects they had in view.

The cordial thanks of the institute were voted to Mr. Groves for his very able and interesting communication, and the Chairman, on behalf of the council, assured that gentleman that the co-operation of the institute would be given in every possible way to promote the objects which the committee of this fund had in view.

ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting was held at the rooms of the Association on Friday last, Mr. Ridge in the chair. The minutes of the last meeting were read and confirmed, and Messrs. T. Cole, A. Bobbill, and B. A. Mayhew were proposed and elected members of the Association.

VENTILATION.

Mr. MATHEWS, one of the honorary secretaries, then made a few remarks to the meeting illustrating a system of warming and ventilating that had suggested itself to him. He proposed to utilize a great portion of the heat proceeding from kitchen ranges and lost up the chimneys. He would introduce an open chamber at the foot of the kitchen range, and carry it right up through the house closed at the top. Into this he believed all the heated air would enter. He would then construct pipes of the dimensions of a brick, communicating from this air-chamber with the various rooms, and from which, by means of valves, the heated air might be let into the rooms when desired. He believed that by this means the present uncomfortable temperature of our bedrooms might be materially raised. With regard to ventilation, he thought the present chandeliers were great mistakes. Hammond's patent chandeliers were the only ones he knew of admitting of any ventilation, and they were very heavy and expensive. He suggested a trumpet-mouthed flue of glass or mica, through which the supply pipe might descend from the ceiling with a number of jets at the end enclosed in a glass dish. The advantages of this plan would be a great increase of light, owing to the total absence of shadow, and all the heat would ascend through the flue into the air-chamber constructed as he had described in the building. He had not fully worked out the ideas he had given to the meeting, but he thought, if well followed up, there might be found something in them.

Mr. E. J. TARVER then read a paper on—

SYMMETRY FROM A GOTHIC POINT OF VIEW.

Should not the study of Gothic or English architecture, he would ask, be undertaken with as much attention to symmetry as the study of Classic? Were the Classic styles necessary or right to be adopted in England? If not, should we give up the application of the symmetrical principle to Gothic? Was it not to the total neglect of this principle that we are indebted for the many vagaries that had appeared since the modern revival of Gothic art? Modern Classic buildings chiefly consisted of four classes: first, imitations of antique temples, like the Madeleine at Paris; second, combined imitations like St. Pancras Church, a very handsome building, with its two little temples of different orders placed on the top of one another by way of a steeple; third, the Italian; and, fourth, those modern buildings, really Classic by birth and education, yet, finding themselves in the neighbourhood of differently designed structures, had quietly submitted to distortions of every description. Classicists gave the human form as their pet example of symmetry. But when the body was put into motion what then became of its symmetry? He referred to an enlarged elevation of the palace of the Archduke Michael, at St. Petersburg. It was a purely Classic building, and one of the best modern erections in that style he was aware of. The two wings of the building were externally exactly alike, but, on consulting the plan, one wing consisted of a spacious apartment occupying nearly the whole of it, while the other comprised a number of small rooms. This was certainly not true symmetry. By analyzing the terms "balance," "proportion," and "symmetry," he pointed out that the first referred to an instrument for testing the relative weights of *two* bodies, as, for example, to a centre flanked by twin masses in equipoise, and so to the design of most Classic buildings; that "proportion" dealt with single features, or as much as could be comprehended in one glance; but that the term "symmetry" meant literally "measuring together," and might be taken in a more comprehensive sense than the others. He thought that balance was right where there was no reason to the contrary, but that we should recognize the fact that symmetry should not be confined to the sub-division of a façade into two equal halves, or even to façades at all, but that it is the principle which should guide the distribution, form, and size of every limb and feature of a building.

Mr. MATHEWS said Mr. Tarver had pointed out the want of true symmetry in Classic buildings, but he had not told us where it existed in Gothic. He would also like to know by what rule we were to judge of the symmetry of a building. He inferred from Mr. Tarver's paper that a correct eye was the only criterion, and he thought that this could not always be trusted to.

Mr. LONSDALE said it had struck him that the Classic idea of symmetry might be well illustrated by the ordinary scale, in which two equal weights counterpoised each other. The Gothic notion, on the contrary, resembled the steelyard, in which the balance was maintained by two masses of unequal size but of similar weight.

Mr. GILBERT REDGRAVE remarked that Mr. Tarver had been very severe upon Classic architecture, and especially on the unfortunate church of St. Pancras. He believed, however, that the style of steeple introduced by the architects was not altogether without precedent in ancient times, although he could not then quote the example.

Messrs. Potter, Birch, and Quilter joined in the discussion, and, Mr. Tarver having replied, a vote of thanks to him for his paper was unanimously carried, and the proceedings terminated.

MR. GLADSTONE ON TRADES' UNIONS

ON Tuesday last, a deputation from the London Trades Societies waited, by appointment, on Mr. Gladstone, for the purpose of refuting certain alleged incorrect statements made by him, in his speech at Oldham, on the 18th of December. In the course of his remarks, Mr. Gladstone stated:—The question I wish to raise is whether certain of these restrictions are beneficial to the labourers. The whole body of labourers of the country go further than the limit of each trade union. I will not undertake to say that some of these restrictions are beneficial to the carpenters considered as carpenters, or to the bricklayers considered as bricklayers. I look at the whole of the wage-receiving population of the country, and I own it appears to me as a general rule that regulations in restraint of labour go to diminish the aggregate amount of the fund which constitutes the whole wages of the country. Of course there is a difficulty in drawing a line with precision. I may be told that the argument, if it were taken without limitation, would imply that every man was to slave from morning to night, seven days in the week, without any consideration for his health or his mind. I have not a word to say against limitations imposed with a view to the preservation of health and social considerations. Do not let me be understood as saying that society at large has any reason to complain. It is difficult to raise questions between class and class. Of course society has reason to complain of all unreasonable and excessive use by any class of its privileges; but that is a point very difficult to define. It is not the bearing of certain restrictions that prevail more or less in trades' unions upon society that I shall animadvert upon, nor their bearing upon employers. The restrictions imposed upon employers in many cases have had a most powerful effect in stimulating invention, and the introduction of machinery might have been less rapid but for the fact that in some businesses employers have found themselves hard driven by what they have thought the restraints imposed upon them. Let me refer for a moment to the rules against women, boys, and men. There was a rule, of which I have often heard in the porcelain business in the Potteries, which appears to me to be a very

strong one, that a woman was not allowed to paint porcelain with a rest for her wrist. The practical operation of that I understand to be that no woman can do fine work on porcelain where that rule is observed. Of course it may be said that the labour of women competes with the labour of men, that women can work cheaper than men, and that the men are thrown out of employment. My answer to that is, I cannot look upon women as a class of beings alien and separate from men. If they do compete with the men, they are the wives and daughters of the men; and, if their labour is cheaper than that of the men, it is for the benefit of the men themselves as a class—that is to say, the aggregate earnings of the labouring class in the community, and in that particular trade, are greatly increased. With regard to the boys, it is exactly the same thing. The boys whose entrance into trade is more or less fettered and barred—sometimes by limiting the number of apprentices, and sometimes by forbidding them to labour except as apprentices—do not come into the world of themselves. It is said that apprentices have small wages, and that that is a reason for limiting their labour. If that is the fact, the question is whether it is not desirable that they should work as unapprenticed boys, and obtain the best wages the market would afford. It was objected by some one who wrote to me that skilled men were expected to instruct apprentices. Now I should not complain in the least if the skilled man said to his employer—"It is one thing to do work for you; it is another to teach others." And if I were a skilled workman asked to teach apprentices, I should consider whether I was not fairly entitled to make a charge for it. Then we come to rules affecting men. First, it rules against piece-work, and prescribes for each man the mode in which he shall actually perform his labour. I have heard of a rule in the bricklaying trade in Lancashire against working down the raw material at the place where it can be done best and cheapest. Just let me ask what would be the effect in Lancashire of attempting to lay down a rule with regard to the number of apprentices in the cotton manufacture. It is there, in the great staple trade of the country, that the labour of the young is the most free, and it is there that upon the whole the labouring men of this country enjoy the most independent and solid position, as was proved by the manner in which they were enabled to meet the terrible calamity of the cotton famine. I believe there are rules among masons to the effect that the stone which is quarried may not be "dressed," as it is called, in the quarry itself, but must be taken to the place where it is to be put in the building. Now is it possible, as a matter of reason, to denounce too strongly such a rule as that? It is a rule worthy of savages. There was nothing in the Corn Law that was a bit worse than that. It is a waste of human labour. It is refusing to make God's gifts go as far as He intended them to go when you require labour to be done by such a useless regulation. I do not know whether that is a trade union regulation or not. [Mr. Potter and some of the members of the deputation stated that it was not.] I am glad to hear it. I now come to rules with reference to unskilled labour. I have here a printed paper containing a regulation passed by the operative bricklayers in Liverpool. It says:—"Dressing off has been done on a system similar to tiling. There are individuals who have each a son or two, whom they bring up to it only, and yet while young they attained such a proficiency in the style that it is permitted to be done, and the lads are able to earn good wages by it, but at a price that no master would accept who has to pay experienced men at the current wages." I understand that to mean that dressing-off is a thing which boys can do, that boys are taught by their parents to do it, and can do it in a competent manner, and earn good wages. The complaint is that the wages are lower than the men's. Now, it appears to me that all attempts to limit the labour of those boys are attempts to limit the aggregate of the wage fund of the country. Other cases have been sent me. Here is a resolution of the National Association of Operative Plasterers, dated Jan. 23, 1868:—"That we, the operative plasterers, having viewed with deep regret the encroachments made on our trade by unskilled labour, more particularly in lime-washing, resolve that on and after the 1st of March, 1868, all lime-washing be executed by plasterers as per working rules, and in the event of any employer attempting any infringement of the said rule, the members of this association will cease to work in his employ." The question there raised is not that lime-washing cannot be done by these unskilled men, but that they compete with the plasterers. All that I call part of a war against labour.

THE SUPPORTING POWER OF PILES.

A PAPER "On the Supporting Power of Piles; and on the Pneumatic Process for Driving Iron Columns, as practised in America," by Mr. W. J. McAlpine, M. Inst. C.E. (of New York), was read at the Institution of Civil Engineers, February 18, 1868, Charles Hutton Gregory, Esq., president, in the chair. The first part of this paper related principally to the experience gained in driving six thousand five hundred and thirty-nine piles, an average depth of 32ft., for the foundation of the Government Graving Dock at Brooklyn, N.Y., when the support was mainly derived from the adhesion of the material into which the piles were driven, and slightly from their sectional area. The piles were in rows 2½ft. apart, and at transverse distances of 3ft., all from centre to centre, intermediate piles of tough second-growth oak being frequently employed. The main piles were chiefly round spruce spars, very straight, from 25ft. to 45ft. long, and not less than 7in. in diameter at the smaller end, and on an average 14in. in diameter at the larger end. From a record kept during the progress of the work, it was ascertained that it took two and one-third blows to drive each foot of pile, and that the distance moved uniformly diminished from the first to the last blow, ranging from 8in. at the beginning to no movement at the end, the average distance moved by the last five blows being 1in. A considerable number of the piles were driven by a Nasmyth steam piling machine, with a ram of 3 tons, and a stroke, or fall, of 3ft., and making from sixty to eighty strokes per minute. The other machines were generally operated by steam power, giving an average of a blow per minute; but occasionally the hammers were hoisted by manual and horse power. The rams in the latter machines were of cast-iron, swelled out at the bottom to concentrate the weight at that point, and weighed about 2,200lb. each, though some were used of 1,500lb.; the fall being 30ft. It was observed that the heaviest ram, when striking blows of the same effect as lighter ones, did the least injury either to the head of the pile or to the protecting iron ring, and this injury was still less with the Nasmyth hammer. It was also found no advantage was gained by the fall of the ram being more than 40ft., as the friction on the ways then prevented any increased velocity to the ram when falling from a greater height. With the Nasmyth hammer, piles were driven 35ft. in seven minutes, while with the other machines similar piles required one hour, or more, to drive them the same distance.

Experiments were made at different times to ascertain the weight which the piles would sustain. For this purpose a long lever of oak timber was employed, with which a number of the foundation and coffer dam piles of nearly the same size, and driven under exactly similar conditions, were withdrawn. It was thus ascertained that a weight of 125 tons was required to move a pile, driven 33ft. into the earth, to the point of ultimate resistance, with a ram weighing 1 ton, and falling 30ft. at the last blow. These trial piles averaged 12in. in diameter in the middle. From a number of other experiments, it was believed that the extreme supporting power of the pile, due to its frictional surface, was 100 tons, or 1 ton per superficial foot of the area of its circumference. From an analysis of the experiments, the following general laws seemed to have prevailed in these cases:—First, that the effect of lengthening the fall of the ram was to increase the sustaining power of the pile in the ratio of the square root of fall. Second, that by adding to the weight of the ram, the sustaining power of the pile was increased by 0·7 to 0·9 of the amount due to the ratio of the augmented weight of the ram. Third, that a pile driven by a ram weighing 1 ton, and falling 30ft., would sustain an extreme weight of 100 tons The formula based upon these data, as applicable to rams weighing from 1,000lb. to 3,000lb., falling from 20ft to 30ft., was

$$X = 80\ (W + 0{\cdot}228\ \sqrt{F} - 1),$$

in which X was the supporting power of a pile driven by the ram W, falling a distance F; X and W being in tons, and F in feet. The author was of opinion that, under the most favourable circumstances, the pile should not be loaded with more than one-third of the result given by this formula; and when there was any danger of a future disturbance of the material around the pile, or when there was any vibration in the structure which might be communicated to the piles, the load imposed should not exceed one-tenth.

The bearing support due to the sectional area of the pile had not been considered in the preceding inquiry; but numerous experiments had been made, which gave results of from 5 tons to 10 tons per square foot.

A NEW CLASS DIRECTORY.

MESSRS. WYMAN and SON, of Great Queen-street, have announced a new class directory, which promises to supply a long felt want. It is to be called the "Architects', Engineers', and Building Trades' Directory for 1868;" and will be a business book of reference for the various industries connected with the arts of construction throughout England, Scotland, and Wales. But why Ireland should be left out of the question we cannot imagine. Ireland is a far more important part of the kingdom, as far as architecture is concerned, than Wales. The directory will also contain a concise sketch of the professional career of all the leading persons engaged in architecture and engineering. If this new annual realizes what it promises—and we see no reason why it should not, but many reasons why it should, considering the respectability and experience of its projectors—then may we soon expect from their hands an invaluable book of reference.

ROMAN HOUSES AND VILLAS IN BRITAIN.

SO little beyond the mere substructure of Roman houses has been discovered in Britain (says Mr. Henry Godwin, F.S.A., in his valuable "Handbook to English Archæology," just published), that antiquaries have doubted whether the walls of brick or stone extended up to the roof, or whether the walls were only raised a little above the floor, to support a substructure of wood. "Perhaps the safest conclusion," says Mr. Wright, "is, that in houses of people of wealth and importance the walls were of masonry; while, in the more ordinary houses, the masonry of the walls may have risen only two or three feet above ground." An almost solitary instance in which the walls, built of stone, are still standing at an elevation above the doors and windows, occurs in the neighbourhood of Hadrian's Wall. In forming an opinion of the general appearance and elevation of these houses we are, however, somewhat assisted by the drawings in very early manuscripts. An Anglo-Saxon MS. (Harl. No. 603, doubtless from some classical prototype) presents a view of a house with arched windows and a tiled regular roof. For ground plans, and the general arrangement of the lower apartments, we have abundant materials. Separate houses in Roman-British towns are of the greatest rarity. One example has been found at Lympne, in Kent, of which the ground plan seems perfect. It has what seems to have been an almost invariable peculiarity of Roman houses in Britain—a semicircular projection from one of the rooms. It stood north and south 30 feet, exclusive of this southern wing, and extended about 50ft. east and west. The arrangement of houses in streets, generally narrow and irregular, has been traced at Aldborough (Isurium), where a row of connected houses occurs; at Chester (Ciluruum), exhibiting intricate alleys; at Caister (Durobrivæ), in confused masses; and in London interruptedly. The excavations at Wroxeter (Uriconium) promise more satisfactory results. The Roman villa was an establishment of enormous extent, having large courts, around which the buildings were grouped. The largest and most magnificent yet discovered in England is that at Woodchester, Gloucestershire, which, although not fully excavated, covers an area of 550ft. by above 300ft. It had two courts lying nearly north and south, one 150ft. square, and another 90ft. square, surrounded by a gallery or cryptoporticus. The principal apartment was 50ft. square, and had a splendid tesselated pavement, probably based on a hypocaust, with a fountain in the centre. The ruins of another villa, hardly inferior to that at Woodchester, have been discovered at Bignor, near Arundel, in Sussex. In many respects the villa at Bignor was the more splendid, for the courts and crypto-

portici were larger, and the baths more extensive. The two courts of the villa extended north-west and north-east. The inner court was a parallelogram, somewhat imperfect, from the southern side being a little longer than the northern. The court crypto-porticus measured 137ft. 9in. in length and 10ft. wide. It is computed that not fewer than one hundred Roman villas have been discovered in England, and that they form but a small portion of the whole. The most magnificent have been found in the south-west districts.

NEW METROPOLITAN PROJECTS.

FOR the information of the Commissioners of Sewers of the City of London, Mr. W. Haywood, engineer and surveyor to the commission, has issued a report upon the various projects of the railway companies and other bodies applying to Parliament during the present session for powers to enable these projects to be carried out.

The following schemes, plans, and bills have been deposited by the promoters :—

The Eastern Metropolitan (Underground) Railway Bill is for the formation of an underground railway commencing in the city by a junction with the Metropolitan Railway in Aldgate High-street, east of St. Botolph's Church; from that point it is to be carried along the Whitechapel High-street and the Mile End-road to a junction with the Great Eastern Railway at Bow. The entire line is to be subterranean. By exchange stations at Bow and at Aldgate High-street passengers will be carried from the west to the extreme east of London without leaving the railway system, if this proposed railway is carried out.

Another Bill is to enable the formation of a railway between Little Moorfields and the Essex-road, Islington, at a point near to the Agricultural Hall. The line is to be on a viaduct, starting at a level of 30ft. above the pavement in Little Moorfields; Tenter street is to be crossed by a bridge 22ft. high, White-street by a bridge 21ft. high, and Reynolds-court by a bridge 19ft. 6in. high. The viaduct is to be formed of wrought and cast iron. The line appears to have been projected with the view to secure that traffic which it is anticipated would go from Islington to the city by means of the projected new line of thoroughfare from Upper-street, Islington, to Fore-street, which was reported on by the engineer in October, 1865.

A third project is for making a junction railway between the Metropolitan Railway at Smithfield Market, and the London, Chatham, and Dover Railway. The junction with the Metropolitan Railway is to begin at the Meat Market; it is then to be carried beneath the new street now being formed from Farringdon-road to the western side of the market, and thence by a curve beneath St. John's court, to a junction with the London, Chatham, and Dover Railway at Snow-hill. The line will be entirely subterranean.

Next, we have a proposal for the formation of a subway beginning at Tower-hill, a little to the north of Lower Thames-street and the Tower Dock, crossing beneath the river, and terminating on the southern side near to Pickle Herring-stairs, in the parish of St. Olave, Southwark. A description of this project appeared in the BUILDING NEWS, November 29, 1867. Says Mr. Haywood, "Of the utility of any safe, quick, and cheap means of crossing the river at this spot, there can be no doubt, but what is imperatively demanded is a new bridge across the river, with suitable approaches on either side, and, if that were constructed, this subway would be unnecessary."

To these may be added a Bill promoted by the Corporation of the City of London, with the view of supplying the citizens with gas of an increased illuminating power and greater purity, and at a lower price than it is already supplied. The gas is to produce from an argand burner consuming 5ft. of gas per hour, a light equal to that of eighteen sperm candles of six to the pound, each burning at the rate of 120 grains per hour, whereas the illuminating power of the gas supplied to the citizens is, according to the Metropolis Gas Act of 1860, only equal to that of twelve sperm candles. The charge is to be not more than 3s. 6d. per 1,000 cubic feet of gas, the present price being 4s. per 1000 cubic feet for gas of inferior illuminating power. The site of the proposed gas works is on the northern banks of the Thames at North Woolwich to the east of Silvertown, from whence the leading mains are to be brought by the principal roads to the city. The total area, including public way, scheduled within the city for the several projects reported upon, is about 1¼ acres, which the report states is very much less than has been scheduled annually for many years past.

DETAILS FROM HEREFORD CATHEDRAL.

HEREFORD Cathedral, though small, has many charming details which are well worth the attention of the architectural student. We give this week two illustrations from the Lady Chapel. No. 1, an unglazed opening between the chapel and the south aisle, is a curious mixture in style of Semi-Norman and Early English. No. 2 is pure Early English at its best period, and the arch mould is a fine example of enriched moulding. No. 3, on the same page is a pinnacle from Peterborough, exhibits the same mixture of Norman and Early English in its detail as No. 1.

WORKS IN NEWCASTLE.

WE have received the reports of the Surveyor of the borough of Newcastle for the years 1865-6-7. A comparison of these reports shows that the number of new streets sewered last year was 49, a corresponding number being flagged and paved. In the previous year, the number was 31, making altogether 83 new streets completed since the adoption of the new Act, besides others in progress. The average number of streets annually completed under the old Enactment did not exceed 11, which shows the very marked results that have followed the application of the recent new Act. Forty-one new streets have been built upon during the past year, while the number of houses built was 370, or an increase of more than three times the number built two years ago. A large portion of these houses, it appears, consists of the class called flats; they are substantially built, but an objectionable feature, says the surveyor, exists in the arrangement of the bedrooms.

In the upper flat they are too small, seldom exceeding in cubical contents 600 feet. This small breathing space must be prejudicial to health, and the surveyor has done well to call attention to it. There have also been built 3 schools, 1 church, 1 chapel, 1 theatre, 1 parsonage, and 5 warehouses during the year. As to drainage we note that 473 branch drains have been laid down to old houses, and to new houses, under the building regulations, there have been 382 drains, making a total of 855 houses drained during the year. There are now 11,395 houses altogether drained within the borough. The total length of sewers constructed in the course of the year was upwards of 5½ miles.

STOGURSEY SCHOOL, SOMERSET.

THESE handsome schools have been recently erected at Stogursey, or Stoke-courcy, in the diocese of Bath and Wells, by Sir P. P. F. P. Acland, Bart., of Fairfield. The principal room, 65ft. by 20ft., is fitted up for boys and girls, and a spacious class room is in the rear, opening into it by means of a pointed arch. The lobbies are formed of wood framing, and are easily removed on occasions of anniversaries of school treats. Opposite the class room is a projection, appropriated for boys' and girls' cloak rooms, the whole forming a Greek cross on plan. These cloak rooms are fitted with fireplaces, and are used by those children who attend from distant hamlets, where no schools exist, for dining rooms. The great room is fitted with desks and benches, so made as to serve as adult sittings upon occasions of village lectures, &c. At the junction of the school with the house is a Belvidere tower, with stone staircase ascending to the open belfry, the windows of which are fitted with wide stone slabs for telescopes to command views of the extensive range of Quantocks on the south side, and of the Bristol channel and Welsh hills on the west. Glades have been cut through the Fairfield woods, so as to bring in the schools as an architectural feature. Mr. Merrick, of Glastonbury, executed the dressed stone work, Sir Peregrine's own men doing the hard stonework under the direction of Mr. Millard. The walls are built of a hard sandstone, from the Quantock hills, of a pale pinkish red, each stone squared and dressed to a fine face, which contrasts well with the cream coloured dressings from the Bath quarries. The windows are filled with rolled cathedral tint glass, with stamped borders, by Messrs. Powell, of Whitefriars. There is a heating apparatus, besides open fireplaces. The whole buildings have been erected, at a cost exceeding £3,000, by the munificence of Sir P. P. F. P. Acland, Bart., of Fairfield, who also gave the site, and form a conspicuous block, grouping with the conventional Norman church and the remains of the mediæval castle. Mr. Norton, of 24, Old Bond-street, London, was the architect, from whose designs, and under whose superintendence, the whole of the works have been carried out.

NEW COUNTY COURT, BRIGHTON.

THE subject of our illustration is being erected in Church-street, adjoining the Old Infantry Barracks, and contiguous to the Pavilion. It is designed to provide adequate accommodation for the increasing business of the County Court, and contains a public office, 31ft. 6in. by 20ft.; bailiff's office, 18ft. by 10ft.; registrar's office, 20ft. by 17ft.; judges' room, 17ft. by 18ft.; court, 41ft. by 35ft.; with open timber roof, 34ft. high; with the requisite retiring and consulting rooms, &c. Cellars are provided in the basement, and additional offices and apartments for the residence of the office-keeper on the first floor. The structure will be of red brick, with selected Bath stone dressings, and covered with tiles; the doors, sashes, and the principal part of the joinery will be of Stettin oak. The buildings generally will be warmed by warmed fresh air in large volume, with adequate provision for the extraction of the foul air from the various rooms. Ten tenders were submitted for the erection of the building, varying from £6,246 to £5,395, which sum, that submitted by Mr. J. T. Chappell, of Steyning, was accepted. Mr. Thomas Charles Sorby, of Brunswick-square, London, is the architect.

THE PEABODY TRUST.

IN accordance with the wish expressed by Mr. Peabody that a report of the application of the funds given by him to the poor of London (with receipts and expenditure) should be laid before the public once in each year, the trustees have just issued their statement for 1867. The account shows that the original fund has been increased by rents and interest on unexpended capital to the extent of £20,042 6s. 4d., making the sum total at the end of December, 1867, £170,042 6s. 4d. The buildings at Spitalfields and Islington continue fully occupied, with increasing demand in anticipation of vacancies. At Shadwell, the four ranges of buildings forming Peabody-square, and containing 195 tenements, were completed and ready for occupation at the close of the year 1866; but, owing to the depression of business and the consequent suspension of employment in that part of London, they have been somewhat slow in filling. At the commencement of the present year 175 families are resident, and the number is gradually increasing. The total population in all the buildings erected by the trustees is 1,583. The sanitary condition of the dwellings continues highly satisfactory, and the houses, well ventilated, open to free air, and kept with scrupulous cleanliness, appear to secure exemption from diseases incident to crowded localities. The deaths during the past year were seven adults and eighteen children, all from ordinary diseases.

A number of men employed in a ballast pit on the Brechin (Scotland) branch of the Caledonian Railway lately came upon some interesting remains. The principal of these is a large circle 66ft. in circumference, in the centre of which is a grave, from which have been excavated human remains which had evidently been burned. Within twenty yards of these interesting relics, other graves containing human remains have been found, and in one of them was discovered part of an implement. Antiquarians who have visited these places are of opinion that the place once was the rendezvous of a party of Druids.

MAL-ADMINISTRATION OF THE PEABODY TRUST.

MR. GEORGE PEABODY, with an amount of wisdom and forethought which we could wish always accompanied sincere benevolence, provided that the trustees of his magnificent gift to the poor of London should annually render an account of their stewardship. The account for the past year has accordingly just appeared, and it is with regret we feel constrained to say, that it does not show the wise and economical management which so generous a donation deserves. The trustees evidently desire to take credit for effecting some considerable amount of good, they speak of the exemption of their tenants from diseases incident to crowded localities, of their good order and and general contentment, their peaceful deportment, and the improved order within their apartments, the healthy aspect of the children, the neatness and tidiness of their dress, and their inoffensive happiness at play in the ample and secluded playgrounds. Altogether they draw a picture which we should rejoice to see realized universally among the crowded and ill-lodged poor of London. We do not desire to remark on this portion of the subject, further than to say that such results are no more and no less than have been achieved in every case of improved dwellings for the last 20 years, and that knowing how carefully, in all such cases, the tenants are selected, in the first instance, from the number of applicants, we do not attach much importance to them. While "model dwellings" are few in proportion to the great demand, the trustees can always select "model tenants, and secure a "model result." The great point of public interest is, to know if the fund is being made the best use of. All else is of minor consequence.

In the first place, we observe that no progress whatever has been made in building for nearly two years past. In December, 1865, it was reported that £9,487 5s. 3d. had been paid for two sites at Chelsea and Bermondsey, and these are reported still as unbuilt upon, and figure in the present account for £9,525 18s. 9d., having been retained at an actual expense to the fund of £38 13s. 6d. We should like to know where these two sites of building land precisely are, and what has caused the increase of £38 13s. 6d. in their cost. Are they now covered with houses, and if so where are the rents of those houses? Or are they vacant building plots, and if so why, having money to build on them, permit them to remain vacant? A balance of £44,000 remains in railway debentures and at the bank. Surely it is not good management to leave such a sum so long unemployed, and particularly as money has been realizing so little interest for some time past. While improved dwellings are in such urgent and great demand, all delays are inexcusable. We observe that a further sum of £2,101 has also been paid on account of a site at Westminster, although it is said in the body of the report that the trustees are "negotiating" for it. Let us hope there is some mistake here that may hereafter be explained, and that the trustees have at least brought their negotiations to a tolerably secure stage before paying so much as £2,101 on account. Altogether, this policy of buying up plots of land to be afterwards left vacant, incurring additional expenses, appears to be neither advantageous to the fund nor beneficial to the poor of London. We certainly think a little more explanation is due than has yet been vouchsafed, respecting these unproductive amounts.

Let us now look at the portion that is productive. It stands as follows :—

Amount placed at Interest.	£	s.	d.
London, Brighton, and South Coast Railway Debentures	30,000	0	0
Expense Fund	1,144	2	8
Cash balance in the Bank of England	14,686	3	6
	£45,830	6	2

Amount producing Rental			
Land and Building at Spitalfields	27,215	11	3
" " at Islington ...	40,397	2	1
" " at Shadwell ...	44,972	3	1
	£112,584	16	5

With respect to the amount at interest, it is right to observe that the trustees do not state that the amounts of the expense fund, and the large balance at the bank, do actually bear interest. We think they ought to do so, and give the trustees the benefit of the doubt. On this and several other important particulars the accounts are far from clear. Several discrepancies exist between this and the two former reports, and it is only after a close analysis that we have been able to arrive at a clear estimate of their real value and significance. That analysis we have, however, thought it our duty to make, not only in the interest of the poor to whom this vast fund belongs, but also as affecting the great problem of dwellings improvement, which cannot fail to be very much influenced by the course taken in its expenditure. As affecting the poor, we find that houses have been erected to accommodate 452 families in about 800 rooms, and the cost (making every allowance for some shops in Spitalfields) is at the rate of £130 per room. Now, the Metropolitan Association builds houses at a cost (including value of the land) of £52 per room. The Industrial Dwellings Company do the same at £53 per room, and the Corporation of the City of London (which we consider extravagantly dear) built upon a too costly site, the value of which alone is equal to £30 per room, at the total rate of £90 per room. Hence it follows that, if either the Metropolitan Association or the Industrial Dwellings Company had expended the same amount, they would have accommodated 1,130 families of the London poor, being 668 more than the Peabody trustees have done, and even the City Corporation would have accommodated 664, being 212 more. With these facts staring us in the face, it is impossible to feel satisfaction at the report of the trustees. We are grateful to Mr. Peabody for his gift, but we cannot be grateful to his trustees for its management. That 452 families are better accommodated is a pleasing fact, but how about the much larger number that are not better housed, and ought to have been with the same money? This large expenditure cannot be explained away by any reference to substantiality of building, or increased comforts, because the buildings of the Metropolitan Association are equally substantial, and have better comforts, inasmuch as the rooms are generally larger and neater, and each family possesses its own scullery and domestic conveniences exclusively to itself, accommodations shared only in common by twenty or thirty families in the Peabody buildings. The same remarks apply to the other buildings referred to. The open corridor system, which is that adopted by the trustees, has many serious drawbacks; it ought, however, to have the advantage of cheapness, and we are at a loss to conceive how the enormously extravagant expenditure could have been incurred upon it. If the trustees, before commencing another block, will only consult experienced men, they may be instructed how to build houses at considerably less than an average of £130 per room.

The bearing of their proceedings upon the general question of dwellings improvement is hardly less important. We have not yet got beyond the stage when every new building of the kind is looked upon as a "model." That our poor should ever be entirely housed by charitable gifts, the efforts of associations, or even by public grants, is neither to be expected nor desired. After all, our main hopes of improvement go only towards the attraction of capital in this direction. When it is shown, as we are sure it might be shown, that improvement will pay, the great difficulty is solved. This, we contend, has been shown both by the Metropolitan Association and the Industrial Dwellings Company. The family dwellings of the former have always produced a clear rental of 5 per cent. those of the latter pay better still, and the shareholders have received several dividends of 5 per cent. upon their unproductive as well as productive capital. We are not forgetful that Mr. Peabody's donation is not to be laid out primarily for profit; but we are at the same time aware that it was far from his intention to lessen the feeling of honest independence in the persons benefited by his gift. They were to be well housed, and to pay a fair rental; and, as a matter of fact, they do pay the full value for their apartments. Their rents, considering the equivalent accommodation, are no less than they would pay in other improved dwellings; but the amount of profit to the fund is much less, being for the past year only 1·9 per cent. This fact goes far to neutralize the honest efforts of others. Beside their buildings, worthy of all imitation, the Peabody trustees have managed to erect others, which can only scare away capitalists, and be looked upon as "models *to be avoided*." This is disastrous, because of the great public interest taken in so splendid an act of benevolence. We know of no other way that its ill effect can be neutralized than by pointing, as we have done, to the source of the evil in the outrageously extravagant first expenditure. One half of Mr. Peabody's gift yet remains to be expended, and we hope the trustees will adopt a wiser course with that amount, and invest it in a way which shall be at the same time more economical and give more extensive benefit to the poor of London. They will thus, in some measure, retrieve their past errors; and, instead of retarding, as they now do, they may give increased impetus to a general improvement in dwellings.

THE COLOSSEUM.

MELANCHOLY is the only word that fitly describes the appearance of the once celebrated Colosseum, in Regent's-park. Those who can remember the varied glories of this establishment twenty years ago will look upon its present appearance at least with regret. Whilom one of the chief attractions, and most favourite places of entertainment of which the metropolis could boast, the Colosseum is now dreary and deserted. The Glyptotheca, once so much extolled, is now as silent and lifeless as the stone statues which formerly adorned it; the picturesque Gothic aviary, and the beautiful Arabesque conservatory, are no longer fashionable lounges; the pretty Swiss chalet is a dismantled ruin, and the Temple of Vesta and the Arch of Titus wear almost as ancient a look as the famous relics which they are meant to represent. The whole scene is one of desolation, and calls to mind the lines—

> Cypress and ivy, weed and wallflower, grown
> Matted and massed together, hillocks heap'd
> On what were chambers, arch crush'd column strewn
> In fragments, choked by vaults, and frescoes steep'd
> In subterranean damps, where the owl peeps,
> Deeming it midnight.

The glory of the place has departed. Possessing so many and varied attractions, the repository of a host of objects of beauty and curiosity, some of them perfectly unique in their way, it is rather surprising that the Colosseum should have turned out the complete failure it has. The inconvenience of its situation may have had something to do with its want of success. Bad management may have contributed to bring about the result. But, whatever the cause, the failure is clear. The Polytechnic has beaten the older institution out of the field. The money expended on the Colosseum, from first to last, has exceeded the cost of a royal palace, and its fortunes have been of the most fluctuating kind. The building was designed by Mr. Decimus Burton, the architect; the idea, however, belonged to Mr. Horner, a land surveyor, for whom the building was erected. It was

begun in 1824, and completed in 1827, Messrs. Peto and Grissell being the contractors. It did not receive its name from any architectural resemblance to the Colosseum of Rome, but on account of its colossal size. In reality the edifice is a miniature of the Pantheon, and bears a still greater likeness, it is said, to the Roman Catholic church at Berlin. It is a polygon of sixteen faces, each 25ft. in length, making the circuit of the building 400ft. The walls are 3ft. thick at the ground, and to the glazed dome the height is 112ft. The building is entirely lighted by this dome, there being no side windows. The entrance portico at the west front has been described as the finest and best proportioned portico in the metropolis. It is composed of six Grecian-Doric fluted columns, full-sized models of those of the Pantheon. At the time of their completion the various internal features of the Colosseum were lauded in language which may seem somewhat extravagant in these phlegmatic and hard-to-please days. A quarter of a century ago the edifice was deemed simply a triumph of architecture—a thing wonderful in the way of public buildings. Much of this praise was undoubtedly deserved. Among its attractions are two deserving of special mention. These are the Museum of Sculpture, and the panoramic view of London. The Museum or Glyptotheca, as it is called, occupies the basement of the Rotunda. It has an Ionic colonnade, the columns and entablature being richly gilt, several thousands of feet of embossed glass being spread from the cornice and entablature. The frieze is enriched with basreliefs of the whole of the Panathenaic procession from the Elgin marbles, modelled by Henning. This occupies the whole circumference of the hall, nearly 300ft. Twenty fresco paintings of allegorical subjects appear above. Beyond the circle of columns is one of an equal number of pilasters, dividing and supporting arched recesses. This Museum contains numerous works of art by British and foreign sculptors. As to the panorama, it will always be considered as a marvel of art, as well as a monument to the prodigious labour and perseverance of the artist. The view of the metropolis was taken from several feet above the summit of the cross of St. Paul's Cathedral, the sketches having been begun in 1821, by Mr. Horner. It was completed in 1829. The picture covers 46,000 square feet, or more than an acre of canvas. The circumference of the horizon from the point of view is nearly 130 miles, and the dome on which the sky is painted is 30ft. greater diameter than the cupola of St. Paul's. Of this curiosity of London, Mr. Timbs gives the following particulars—"Excepting the dome of St. Paul's Cathedral, there is no painted surface in Great Britain to compare with this in magnitude or shape, and even that offers but a small extent in comparison. It is inferred that the scaffolding used for constructing St. Paul's cupola was left for Sir James Thornhill, in painting the interior; and his design consisted of several compartments, each complete in itself. Not so this panorama of London, which, as one subject, required unity, harmony, accuracy of linear and aërial perspective; the commencement and finishing of lines, colours, and forms, and their nice unity—the perpendicular canvas and concave ceiling of stucco was not to be seen by, or even known to, the spectator, and the union of a horizontal and vertical surface, though used, was not to be detected. After the sketches were completed upon 2,000 sheets of paper, and the building finished, no individual could be found to paint the picture in a sufficiently short period, and many artists were of necessity employed; thus, by the use of platforms slung by ropes, with baskets for conveying the colours, temporary bridges, and other ingenious contrivances, the painting was executed, but in the peculiar style, taste, and notion of each artist. To reconcile or bring these to form one vast whole was a novel, intricate, and hazardous task which many persons tried, but ineffectually. At length, Mr. E. T. Parris, possessing an accurate knowledge of mechanics and perspective, and practical execution in painting, combined with great enthusiasm and perseverance, accomplished the labour, principally with his own hands, standing in a cradle or box, suspended from cross-poles or shears, and lifted as required by ropes." Describing the Gothic aviary already alluded to, a gushing writer of the period says, "It is superbly fitted up with gilt carved work such as Isabella of Castile might be supposed to have constructed amidst the relics of a Moorish palace, or Abu Abdallah, with true Arabian gallantry, to have conjured up for the solace of some fair Christian captive within the enchanted halls of his own Alhambra." The original projector having failed, the property passed into the hands of trustees. It was subsequently (1843) sold to Mr. David Montague for the sum of 23,000 guineas. By the enterprise of this gentleman the fortunes and character of the establishment were retrieved. Considerable additions were made to the Colosseum in 1845 by the late Mr. W. Bradwell, formerly chief machinist at Covent Garden Theatre, who designed the arched corridor, in the style of the Vatican, which forms the eastern entrance in Albany-street. The same gentleman in 1848 designed and erected the theatre, which at the time was thought very highly of. It is decorated with colossal Sienna columns, copies of some of Raphael's cartoons, and allegorical groups of a gorgeously painted character. It was here where was exhibited for the admiration and delight of a former race of juveniles, the Cyclorama of Lisbon, "depicting in ten scenes the terrific spectacle of the great earthquake of 1755, the uplifting sea and o'ertopping city, and all the frightful devastation of flood and fire; accompanied by characteristic performances upon Bevington's Apollonicon!" This cyclorama, by the way, is said to have cost £20,000. It was added to the establishment by Mr. Turner, whose property the Colosseum became about thirty years ago. When in 1855 the building was put up to auction, it transpired that Mr. Horner, its projector, had expended £23,000 on it, and subsequently above £100,000 in decorations. He held a lease of it from the Crown for ninety-five years, thirty of which had expired. The ground rent was £262 18s. The lease was sold in 1836 to Messrs. Braham and Yates, who laid out £50,000 in additions and decorations to the building. It then passed into the hands of Mr. Turner. The Colosseum, it will thus be seen, has cost upwards of £200,000. The property was not sold on the occasion in question, only £30,000 having been bid for it.

What is to be done with it? There was a rumour some time ago, that it was to be converted into a club house, for the convenience of young men engaged in business. As we have heard nothing further of this scheme, we presume that it has been abandoned. It is a matter of surprise to us, that no speculator has come forward to make one more venture with the edifice, for it may be said that there are few buildings in the metropolis that could be so easily converted into almost any purpose as the Colosseum.

ARCHITECTURAL SOCIETIES.

THE Yorkshire Architectural Society held its annual meeting at York, last week, the Rev. Canon Hey, in the chair. The report congratulated the members upon the satisfactory condition which it had maintained during the past year. The members had continued to increase, and the finances were also in a prosperous state. The committee, however, found matter for regret in the fact that they had met with no response to the offer of prizes made by the society to art workmen competing in articles of wood carving. They recommended a further trial during the present year, retaining the same subject. The want among workmen of power to appreciate the meaning of the architect, and to carry out his wishes, was generally acknowledged. One exception was found, in Mr. Holmes, of York, whose ironwork pulpit, in the new church of Selby, had, in the opinion of the committee, proved him to be capable of advancing to the foremost rank of art workmen. The report was adopted, and the officers of the society were re-elected.

On Tuesday the annual meeting of the Northern Architectural Association was held at Newcastle, Mr. John Green, the president, in the chair. The tenth annual report was read by the secretary, Mr. Thomas Oliver, F.R.I.B.A., and unanimously adopted. A letter from the secretary of the Architectural Alliance was then read, stating that the next meeting would be held in July, and asking the Association to continue their connection with the Alliance, and to send a delegate to the meeting, as on previous occasions. A resolution to this effect was proposed and carried. On the motion of the president, seconded by Mr. F. R. Wilson, it was resolved that Mr. G. G. Scott be made an honorary member. A donation of five guineas to the Architectural Museum was duly voted. The president then read his annual address. Mr. F. R. Wilson then read a paper on "Dangerous methods of Construction in the North." The Secretary then said he wished to speak of a subject which he thought was a proper one to bring before that meeting. Most of them knew that they were going to lose one of the domes from the Exchange Buildings, Grey-street. He believed that they would do well to pass a resolution appointing a deputation to wait upon the Town Improvement Committee, or the Town Council itself, to request that the insurance company, who were rebuilding the premises, should be required to restore the building in its integrity. It was a shameful thing that these people, for the sake of a few hundred pounds, should destroy the proportions of one of the most handsome buildings, he might say, in the world. After some discussion the resolution was agreed to, and the meeting terminated.

PARLIAMENTARY NOTES.

IN the House of Commons on Friday, two questions were asked relative to the proposed New Law Courts—whether an architect had yet been appointed, and whether the proposition of Lord Justice Cairns, the effect of which would be to abolish all the law courts in London, and to have only Courts of Appeal in London, was under the consideration of Her Majesty's Government. Mr. Hunt, the Secretary to the Treasury, said, in answer to the first question, that no architect had been appointed. The present position of affairs was this: In consequence of what passed in this House during the short session a communication had been made from the Treasury to the members of the commission, and the commission had replied by a suggestion to the Treasury that the opinion of the Attorney-General should be taken on the subject of what would be the legal effect of the recommendation of the judges of designs. The Treasury had adopted that suggestion, and a case was now being prepared for the opinion of the Attorney-General. As to the other question, put by the hon. member for Dundalk, the commission had not reported the communication to which he referred to the Government, and, therefore, the Government was not in a condition to take the subject into consideration.

The East London Museum Bill passed through committee on Monday, on which Lord Redesdale seized the opportunity of remarking, in his well-known leave-things-alone style, that it would lay the foundation for claims from every large town in the kingdom. Dublin, he said, was already petitioning, and he could not see why museums might not be just as well established at the public expense in Dublin, or in Lambeth, or in Manchester, or in Leeds, or in Bethnal-green. Neither do we, and we really don't see what there is to alarm any one in the thought, except inert and narrow-minded persons like Lord Redesdale.

WATER SUPPLY AND SANITARY MATTERS.

It is mentioned in the report of the London General Water Purifying Company, which was read at their fourth ordinary meeting on Monday, that the Government has adopted the company's filtering apparatus at the Broadmoor Criminal Lunatic Asylum, where, at the comparatively small cost

of £200, the entire daily supply of 60,000 gallons of water is filtered to the entire satisfaction of the authorities. The report further states, that, although the first nine months of 1867 showed a considerable increase over the same period in 1866, the last three months of 1867 were the worst the company have experienced, caused, without doubt, by the general depressed state of trade. Notwithstanding the example of the medical profession, who, by their use of the company's filters, evince their opinion of its importance in a sanitary point of view (one-seventh of the company's filters sold and hired being to members of the medical profession), of the general public a relatively small proportion only avail themselves of the same advantages, excepting under pressure of some serious epidemic.

On Wednesday week the water was successfully laid on to the town of Houghton-le-Spring, near Newcastle, by the Local Board of Health, under the powers contained in the Public Health Act. The water is procured from a shaft twenty-six fathoms in depth, sunk near the Houghton Colliery, and is forced by a powerful engine to a height of 170ft. through a 9in. rising main into two reservoirs, each capable of containing 250,000 gallons. These reservoirs are formed in the solid rock, and lined with cement and brickwork. Mains varying in size from 2in. to 6in. in diameter, and five miles in length, distribute the water over the whole town and district over which the Board have control. The reservoirs were constructed by Mr. George Bailey, contractor, of Newcastle-on-Tyne. The whole of the works were designed and carried out under the direction of William Cooper, Esq., M.I.C.E., Durham.

Building Intelligence.

CHURCHES AND CHAPELS.

A reredos has just been erected in the lately enlarged church of St. John the Baptist, Helidon. It is the work of Mr. Butterfield, the architect of the church. It comprises a centre filling the space behind and above the Holy Table, and two wings on a level with the table, extending to the north and south walls of the sanctuary. The wings are filled with a zigzag pattern in Minton's tiles and Bath stone. In the central portion is a background of Bath stone inlaid with a cross of red Languedoc marble, resting on a slab, under which is a base of blue marble, and encompassed by circlets in green tile ware. Rosettes in coloured tiles fill the spaces on either side of the cross, with the addition of the letters Alpha and Omega in circles of blue and red marble. The whole is flanked north and south with a pinnacle of red Kenilworth stone.

Sampford Spiney Church, situated at Horrabridge, on the borders of Dartmoor, was reopened last week, after restoration. The building consists of nave, south aisle, west transept, chancel, tower, and porch. The old gallery has been removed, and the church entirely reseated. The chancel has been rebuilt, and a granite chancel arch has been added. The chancel is laid with red and black tiles. The total cost of the work was £650. Mr. A. Norman, Plymouth, was the architect, and Mr. R. Dingle, Stonehouse, the contractor.

The old church of St. Mary, Castlegate, York, having become much dilapidated, measures have been taken in order to its restoration. Mr. Butterfield, of London, has prepared plans for this purpose.

St. Andrew's Church, Blunsdon, has been reconsecrated, the restoration being nearly completed. The style is Early English. A new exterior roof has been added, still preserving the internal character of the old one. A new porch has been erected on the north side. Mr. W. Morris, of London, was the architect, and Mr. Smith, of Highworth, the builder.

A new chapel, erected by the members of the United Methodist Free Church, was opened at Parkgate, near Rotherham, on Sunday. The chapel is built entirely of stone, in the Early English style of architecture, and surmounted by a tower and spire. The total cost of the erection has been £2,600. Messrs. Blackmoor and Mitchel Withers, of Rotherham, have been the architects, and Messrs. Askew, Brothers, of Parkgate, the builders.

The fine old church of Wath-upon-Dearne is now undergoing restoration. The workmen recently discovered a monumental brass in good preservation, containing the following inscription:—"Orate pro ãia Alexandri Mountenay Génsi qui obiit x,viij. diè December, A.D. M.C.C.C.C.V." Besides the brass many cross incised slabs have been brought to light.

The parish church of Puddlehinton was reopened last week by the Bishop of Salisbury. The building has been thoroughly restored and a new north aisle added at a cost of £1,050. Mr. Christian was the architect employed.

The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, held its monthly meeting on Monday, at the Society's house, No. 7, Whitehall, S.W., the Right Rev. the Lord Bishop of Llandaff in the chair. There were also present the Right Hon. the Earl of Romney, Sir Walter C. James, Bart., the Venerable Archdeacon Wordsworth, Revs. Canon Nepean, A. Borradaile, William Reyner Cosens, and Henry Howarth; Messrs. John Boodle, George Cowburn, J. F. France, Edward Hussey, Arthur Powell, F. S. Powell, M.P., William Rivington, and Rev. George Ainslie, M.A., secretary. Grants of money amounting to £840 were made in aid of the following objects:—Building new churches, viz., All Saints, in the parish of St. Peter's, Coventry; All Souls, in the parish of Holy Trinity, Coventry; Helsby, in the parish of Frodsham, Cheshire; and Windhill, in the parish of Calverley, near Leeds; rebuilding the churches at Llangunllo, near Newcastle Emlyn, Caermarthen, and Swinton, near Manchester; enlarging or otherwise increasing the accommodation in the churches at Ashwell, near Baldock, Herts; Dilhorne, near Cheadle, Staffordshire; Farnborough, near Bath; Kinnersley, near Hereford; St. Wendron, near Helston, Cornwall; and St. Wenn, near Bodmin. The grants formerly made towards building a church at Coxhoe, in the parish of Kelloe, near Ferry Hill, Durham, and enlarging the church at Normanby, near Market Rasen, Lincoln, were each increased.

BUILDINGS.

A new grammar-school is now in course of erection at Tamworth, from the designs of Messrs. Spragg and Joyce, architects, of Stafford.

The eastern wing of the New Dead Meat and Poultry Market, Smithfield, is now completed, and workmen are employed in constructing two cupolas, one at each angle of the eastern front which runs parallel to Charterhouse-street. The interior of the shops or warehouses in this wing are being fitted up in readiness for occupation by salesmen. Similar cupolas or domes are to be constructed at each angle of the west front, facing the west side of Smithfield. The underground railway in connection with the Great Western and Midland Railways passes beneath the market to a subterranean terminus midway between St. Bartholomew's Hospital and the market, which has been opened by the Great Western Railway Company as a goods station for the arrival and departure of trains. At present there is a circular incline to ascend and descend to and from the station, but it is understood to be the intention of the company to have a hydraulic lift to expedite the delivery of goods, &c.

The new Congregational schools in Stapleton-road, Bristol, are now finished, and will be occupied shortly. The contractor was Mr. J. P. Stephens, builder, of York-street, St. Paul's. The cost of the schools was about £1,100.

A large warehouse has been erected in Leeds, for Messrs. Constantine and Co., upholsterers. It is in the Italian style, and is built of Harehills stone. It has a frontage of 81ft. and is 86ft. deep. A peculiarity is that the ceilings of all the rooms are covered with pitch pine boards, panelled to prevent dust falling on the goods. Messrs. Dobson and Chorley, of Leeds, were the architects, and Mr. J. H. Thorp, the contractor.

The new cattle market, Southampton, which the town council have had laid out on The Marsh, close to the docks and railway station, was opened on the 8th inst. The cattle stalls are formed by means of two wrought-iron rails and cast-iron posts, 3ft. 6in. in height, bedded in concrete. The flooring is of concrete coated with Portland cement, and drained into stone channelling running the whole length of the stalls, thus securing cleanliness. The market is from the designs of Mr. Lemon, C.E., the borough surveyor, the contractors being Mr. John Cox for the drainage, and Messrs. Hill and Smith, Staffordshire, for the ironwork.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—R. J. T.—J. T.—W. J. G.—O. N. S.—I. J.—A and C. B.—G. S. C.—E. W.—W. T. P.—A. H. H.—T. E. E.—G. B. F.—W. F.—F. W. R.—I. I. and F. W.—W. I. T.—B. W.—I. H.—E. O. P.—W. G. W.—B. H. S. K.—G. W. C.—Edinburgh, 2s. 6d.

F. S.—Birmingham, cases for binding the BUILDING NEWS are ready, 2s. each.

Correspondence.

A FEW THINGS WORTH IMPROVING.

To the Editor of the BUILDING NEWS.

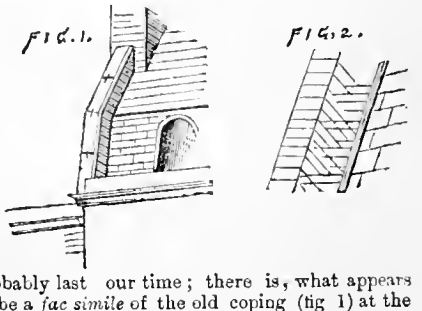
SIR,—Why should architects not be allowed to design a proper and more elegant soldier's-box than those ancient examples at Buckingham Palace and elsewhere? Why do the Post-office officials put up such monkey-looking letter-posts at the corners of the streets, and in pretty villages disfiguring their ancient churches? Can anyone inform the public residing at Belgravia the reason the rich parish of Saint George will not put a six-foot centre paving down the gravel pathway in Eaton-square (*vide* the Marquis of Westminster), and paving on the side of the Palace in Arabella-row? May I ask, in so great a square as Eaton, how it is the plantation near St. Peter's College is allowed to decay, and not kept up like the other portions? When will Sir Richard Mayne instruct his men to prevent ignorant people and children from throwing orange peel on the pavement to the danger of Her Majesty's subjects?—I am, &c.,

Chelsea. G. T. I.

DANGEROUS PARAPETS.

SIR,—At the height of the gale on Saturday, the 1st. inst., the stone coping of a party wall rising above the roofs of some five-storey houses, suddenly shot down upon the footway of the most crowded part of Gresham-street, City. Curiously, nobody was killed. A vacant patch of ground seemed to have been reserved for the purpose, and into this the little avalanche deposited itself with a roar and a splash, but people started back with scared faces, shaking the dust off their hats and coats, and thinking of their exceeding nearness to that condition of which the coroner takes cognizance. One in particular had fumbled somewhat in closing the door of his office, through which piece of clumsiness he came to miss that accident by perhaps a yard or two, and there was no victim.

So it was quite a mean accident, and they have put up new stones as before, which will



probably last our time; there is, what appears to be a *fac simile* of the old coping (fig 1) at the opposite side of the same building, and thousands of the same class upon other curb roofs which wait only for a sufficient degree of dilapidation and a favouring gale. Now the kind of flagging which, being cut out and roughly thrusted, is made to do duty as coping is commonly found to be

base, and only maintained in its position by the force of gravity, and, although some kind of cramps are generally found in such parts as are peculiarly dangerous, these soon burst or loosen the stonework, and if their condition is not discovered their fall is only a question of time. It seems therefore worth considering, whether it would not be better to dispense altogether with this apology for masonry, and use the ancient manner of terminating a brick gable fig. 2 or raking parapet—that which is still in common use on all kinds of buildings in those districts in which brick is the only building material, but which is hardly ever attempted in London, except where some kind of "effect" is aimed at. Such work well set in cement would suffer little from the weather, and could be easily repaired by the bricklayer. When we have a compulsory periodical inspection of the tops of houses, and when the owners are made responsible for such accidents as the last few weeks have produced in unusual plenty, this and similar subjects will receive the amount of attention to which they are entitled.

OBSERVER.

TO WHAT BASE USES HAVE WE COME.

SIR,—I send you an advertisement that appeared in this morning's issue of a Hull newspaper. What numberless letters have been written on the subject of architectural competitions! Now, men of years and experience are invited to task themselves for weeks in designing churches and other buildings, to be erected for small sums of money, and to receive for their trouble either no premium or one merged into the commission, if the works are carried out; still, surely my enclosure is the climax of our degradation. Will the next step of these guardians be to advertise to solicitors for a clerk to the Board, who will draw out their contract deeds for the least money?—I am, &c.

Hull, Feb. 19, 1868. ANIMUS.

SCULCOATES UNION.—TO ARCHITECTS.—The Guardians of the above Union, being desirous of making certain Alterations and Additions in the Workhouse, will, on Tuesday next, be prepared to receive TENDERS, stating for what sum ARCHITECTURAL PLANS of such proposed Alterations and Additions will be Prepared. The Premises may be viewed, and instructions for the Plans received from the Committee, who will be in attendance at the Workhouse, from ten to twelve o'clock, on Thursday next.

The tenders must be delivered at the Board Room before ten o'clock on Tuesday the 25th instant.—By order.

WM. CHATHAM, Clerk to the Guardians.

Board Room, Beverley road, Feb. 15, 1868.

ART WORKMANSHIP.

SIR,—Knowing your love of fairplay, and your determination to "sift" everything that looks suspicious, I take the liberty of calling your attention to the awards of prizes at the late competition at the Society of Arts, in the hope of drawing out some explanation of the following. You are doubtless aware that, for the prizes offered for hammered work in iron, brass, or copper, three specimens were sent in, two in brass and one in iron, numbered respectively in the Catalogue, 14, 15, and 16.

Now, to any practical man, No. 15 is certainly the best specimen of workmanship, and the most correct to the pressribed design (a photograph of which is exhibited with the specimens), and, in support of this, I would call your attention to Mr. Burges's report on these specimens in your issue of the 24th ult. He there pronounces "No. 15 incomparably the best, the back-plate of No. 14 being so beaten up as to be practically useless, while the back plate of No. 16 is not beaten up at all and turned out of too thick a plate, whereas the photograph distinctly shows the back plate to be slightly beaten up from a thin plate." But, in the face of all this, the judges have awarded the first prize to No. 16, and the second to No. 14! It would seem from this that to work strictly to the prescribed design was fatal, and the more clumsy and inartistic the effort of the workman the greater his chance of success.—I am, &c.,

T. W. K.

SIR,—In the report of Mr. Redgrave and Mr. Wyatt on the works sent in competition for prizes offered by the Society of Arts, as published in your paper last Friday, the name of Fisher is, by mistake, appended to a piece of marble carving done by me, which was very kindly noticed, and gained the first prize. The mistake destroys the value to me of your publication of so favourable a report.—I am, &c., JOHN BIRD FISHER.

61, Arundel-street, Sheffield, February 18, 1868.

Intercommunication.

QUESTIONS.

[738]—BORING GLASS.—Will the editor give me directions for boring a hole 1in. in diameter through a pane of plate glass 3-16in. thick?—B

[739]—ILLEGIBLE INSCRIPTIONS ON SILVER COINS.—I should feel greatly obliged to any of your correspondents who will inform me how to read illegible inscriptions on some silver coins I have in my possession, but cannot decipher.—J. C. M.

[740]—SCENE-PAINTING.—Scene-painters mix their colours with size and whiting. Can any of your numerous readers inform me, through Intercommunication, of what the size most suitable is composed?—AMATEUR.

REPLIES.

[734]—BUILDING MATERIALS IN NEW ZEALAND.—I, in common with "E. T." and undoubtedly numerous others of your readers, should like information respecting the building productions of New Zealand, and general state of the Colony. Now as Mr. Drew's 14 years colonial experience warrants the assumption that he is fully capable of imparting the required useful knowledge, I trust that he may be induced to publish the same in a short article in the BUILDING NEWS, as, of course, it is quite out of the question that he can extend the same privilege to all inquirers as that offered to "E. T." Allow me also to reiterate "E. T.'s" query—"are there any works published on the subject?"—F. St. G.

[742]—CRAYON DRAWINGS.—"T." may fix crayon drawings effectually by dipping them in milk.—P. B.

[743]—VENTILATING TIMBER.—In answer to the question by "R. S.," as to the best method of ventilating the timbers of chamber floors, I have seen the following method recommended, which appears a very practicable one, viz., nailing battens transversely to the joists, nailing the laths to the battens, and inserting air bricks in the walls.—R.

[745.]—CEMENT FOR AQUARIUMS.—I send the following for the benefit of your correspondent "S. L. G.;" I think he will find the recipes worth a trial. Mix boiled linseed oil, litharge, and red and white lead together to a proper consistency, always using the larger proportion of white lead. This composition may be applied to a piece of flannel, and fitted to the joints. A more powerful cement is composed in the proportion of two ounces of sal ammoniac and four ounces of sulphur, made into a stiff paste with a little water. When the cement is wanted for use, dissolve a portion of the paste in water, rendered slightly acid, and add a quantity of iron turnings or filings, sifted or powdered, to render the particles of uniform size. In a short time the cement will become as hard as stone.—R. M. C.

[745]—For cementing rockwork into aquaria—pure Portland cement. For cementing the sides together, the same cement should be used as is used by makers of slate cisterns, made of litharge, boiled oil, white lead, and red lead.—B.

[745]—I would advise "S. L. G." to mix a solution of eight ounces of strong glue and one ounce of varnish of linseed oil, or three-quarters of an ounce of Venice turpentine. Boil these together, agitating all the time, until the mixture becomes as complete as possible. The pieces to be cemented ought to be kept in junction for forty-eight or sixty hours.—NORTH BRITON.

[746.]—TO POLISH AND CLEAN MARBLE.—The following hints in regard to marble may be of service to your correspondent "P. S." The substance used in the polishing process is the sharpest sand, which must be worked with till the surface becomes perfectly flat; then, a second, and even a third sand of increasing fineness is to be applied. The next substance is emery, of progressive degrees of fineness, after which tripoli is employed. The last polish is given with tin putty. The body with which the sand is rubbed upon the marble is usually a plate of iron, but for the subsequent process a plate of lead is used, with fine sand and emery. The polishing rubbers are coarse linen cloths or bagging wedged tight with an iron planing tool. In every step of the operation a constant trickling supply of water is required. To clean marble, the following has been found to answer well:—Take two parts of common soda, one part of pumice stone, and one part of finely powdered chalk. These are to be sifted through a fine sieve and then mixed with water. Rub this well all over the marble and the stains will be removed. Afterwards wash the marble over with soap and water, and it will be as clean as it was at first.—A.

WAGES MOVEMENT.

The Master Builders' Association of Bristol, says the "Daily Press," have perfected a scheme for the registration of non-union workmen connected with the various branches of the building trade, so that non-union men will now be enabled to get employment, and employers to get non-union men, if they prefer them, with much greater facility than heretofore. It is the intention, we further learn, of the Masters' Association, should the scheme prove a success, to establish a benefit society in connection with the registry, and, in fact, to use the best endeavours to place non union workmen in a position which shall in every respect be not inferior to that of the union men.

The bricklayers of Walsall are seeking a rise of wages, and the masons have intimated their intention of endeavouring to obtain a new code of rules.

A great deal of excitement has been occasioned at Brynmawr and neighbourhood in consequence of the great iron-masters, Messrs. J. and B. Bailey, giving notice of the closing of their Nantyglo works, at which nearly 8,000 men are employed.

STAINED GLASS.

A stained glass window has just been erected in Leintwardine Parish Church by Messrs. R. E. Edmundson and Son, of Manchester, and is one for which they received the jurors' medal at the late Exposition in Paris. The style is Perpendicular, and the window is composed of four main openings and tracery.

Mr. William Holland has just fixed a memorial window, 22ft. high and 11ft. wide, in the Decorated style, in Lady Huntingdon's Church, Tunbridge Wells.

LEGAL INTELLIGENCE.

NUISANCE CAUSED BY BRICK BURNING.—ROBERTS *v.* CLARKE.—This was a suit before Vice-Chancellor Sir W. P. Wood for the purpose of restraining an alleged nuisance from brick-burning carried on in the neighbourhood of Hackney-downs, at a distance of about 250 yards from the house occupied by the plaintiff. Various defences were raised; among others, that the defendant or his predecessors in title, by having burnt bricks on the particular spot ever since 1825, had acquired a prescriptive right with which the plaintiff, a new comer into the neighbourhood, could not interfere; and, in any case, that the complaints of nuisance and annoyance to the plaintiff and his family were grossly exaggerated. In reference to these defences the plaintiff, on the other hand, contended that there had been a total cessation of brick-burning in the defendant's field between 1845 and 1865, when it was again renewed, and also that, bad as brick-burning was at the best, the evil was in the present case intensified and rendered intolerable by the circumstance that refuse and rubbish of the foulest description, including putrid remains of fish and excrementitious matters, were shot upon the ground, and burnt up together with the clay used in making the bricks. The Vice-Chancellor, without hearing a reply, held that the plaintiff was entitled to an injunction. The defendant, in his voluntary answer, talked of brick-burning having been continuously carried on at the field in question without interruption from 1825 down to the present time, except when there had been some temporary interruption. It turned out, however, that one of these same temporary interruptions had lasted quite 20 years, and upon the law of the case he agreed with those learned Judges who held that, when there had been a cessation of a right of this kind, the person asserting it was bound to show that it had at least been exercised in the first and last year of the period of 20 years in order to preserve it from being lost. This had not been done by the defendant, who consequently failed to establish as of right this easement or privilege of sending foul smoke over his neighbour's land. The rest of the case presented no difficulty whatever. Upon the defendant's own evidence there could be no doubt of the existence of a nuisance. It was not necessary for the plaintiff to prove that any special sickness resulted to himself or his family from the brick-burning, nor that the vapour was more than usually injurious or offensive. It was an axiom of law that brick-burning carried on in the ordinary way was a nuisance to persons living within the limit affected by it, and 250 yards was no extreme limit for the smoke and fumes to reach. A nuisance, therefore, against the continuance of which this Court would grant relief, had plainly been created, and there must be an injunction to restrain the defendant from burning bricks so as to occasion damage or substantial annoyance to the plaintiff, his family, or tenants.

Our Office Table.

The Edinburgh Architectural Association met on Wednesday, last week, Mr. John C. Hay, president, in the chair. Mr. William Beattie, architect, read a paper on "A tour in Belgium in the summer of 1867." Mr. Beattie gave a brief review of Belgian architecture, past and present, and the numerous remains of mediæval civil and domestic buildings in nearly every town were pointed out. The cities of Brussels, Antwerp, Ghent, and Bruges were described at some length, including the many treasures of art to be seen in their museums and upon the walls of their cathedrals. The paper was illustrated by a large collection of drawings and photographs.

We are enabled to state that, pending the report of the commission appointed to inquire into the best plan for facilitating the business of the Courts of Common Law and Equity (of which Lord Justice Cairns is chairman), no further steps will be taken towards appointing architects for the new Palace of Justice. In connection with this subject it may be stated that the recommendation in favour of Messrs. Barry and Street was arrived at before the accuracy of the estimates of those gentlemen had been tested by competent surveyors.—*The Owl.*

A correspondent says:—"In one of your articles last Friday allusion was made to an architect in Liverpool changing his style. That is quite easy. I know of a case where an architect changed his style from Classic to Gothic, the reason being that formerly he had a Classic draughtsman, and now he has a Gothic one!"

Messrs. Bates, Hendy, and Co., of 4, Old Jewry, have sent us a "Handbook and Diary for India and the Colonies," for the present year. It comprises a directory of the leading English manufacturers, and furnishes other information of a kind specially adapted to the use of merchants and traders abroad. They will find the publication a handy and useful business record, and to all such we recommend it.

For several days during the month of January, says Dr. Whitmore, the Marylebone Medical Officer of Health, the Thames water when drawn from the mains of the Grand Junction Company was somewhat turbid and of a yellowish appearance, indicating the presence of earthy matter held in suspension, and showing that it had not undergone its usual careful filtration. This may, no doubt, be accounted for by the late heavy rains which flooded the valley of the Thames, causing thereby a large quantity of clay to be washed into the river, and which, owing to the increased rapidity of the current, did not subside, but was conveyed in a condition of unusual turbidity into the subsiding and filtering beds; the latter becoming in a very short space of time overcharged with earthy impurities, failed to remove all the matter held in suspension, and hence the absence of that clearness and brightness so usually observed in our Thames water.

The following prizes are offered by the Société d'Encouragement of Paris: — A grand medal, value 10,000f., for the application of fine arts to industrial purposes. A prize of 5000f. for the employment of boracic acid and borax. Prizes of the value of 1000f. each for the following subjects—Water-power motor for small workshops; gas jet regulator; a new application of any abundant mineral substance; the disinfection and clarification of sewage water; the application of endosmose of liquids; the application of the endosmose of gases; heating and ventilation of rooms; preservation of food; improved method of making vinegar from wines; and a memoir on the state of industrial art as shown at the late Universal Exhibition in Paris. A detailed programme is to be had by application to the secretary of the Society, 44, Rue Buonaparte, Paris, and all models, plans, and documents are to be sent in on or before the first day of March.

At the fifteenth annual meeting of the Lambeth Permanent Benefit Building Society, which took place last week, the chairman congratulated the meeting on the prosperous state of the Society generally, remarking that, although the advances made during fifteen years had been very large, there had not been one single transaction by which the Society had lost a shilling. The result is certainly highly satisfactory. The three retiring directors, Messrs. A. Wentzell (governor of the Incorporated Society of Licensed Victuallers), C. Hubert, and W. Batchelor, were re-elected, Mr. R. Simmons, jun., of Putney, being elected to fill the fourth vacancy.

A correspondent calls attention to the manner in which the discussions are carried on at the meetings of the Architectural Association. He thinks the Association must be very poor in speakers, or the same names would not always occur, and that the speakers must be very poor in material, or they would say a little more worth listening to when they are on their legs. Each speaker, he says, generally manages to thank the lecturer at the beginning, in the middle, and again at the end of his speech. Each speaker rings the changes on the same ideas. He thinks that an improvement might be effected in conducting these discussions if the speakers would acquaint themselves a little more with the subjects to be discussed before they attempt to enlighten their brother members.

Mr. W. Herapath, F.C.S., the well-known chemist and toxicologist, died last week, at the Manor House, Old Park, Bristol. He was one of the founders of the London Chemical Society and the Bristol School of Medicine, and Professor of Chemistry and Toxicology in the last named institution. Mr. Herapath was in his 72nd year.

A correspondent says:—"Your criticisms on Liverpool architecture may to some appear severe, but they are true. The architecture here is in general poor and vulgar in character. I have found this impression in the minds of all London and Manchester architects whom I have met. In walking about Manchester one meets with some very "violent" Gothic, but in the main the buildings there show a feeling for architectural effect and style that is unknown in Liverpool."

It is proposed, we hear, to form a new town in the Isle of Wight. It will be similar to that of Bouldner, and is to be carried out at Totland Bay, a place which, for its beautiful views, and its excellent sea-bathing, is unparalleled in the Isle. There has long been a desire expressed to bring visitors to the west end of the island, as well as to the eastern part. A number of workmen are already engaged for the erection of brick kilns in order to commence operations.

The largest pendulum in existence is that which regulates the new clock at St. George's Church, New York. The pendulum in question is 35ft. long, and vibrates in three seconds. The "bob" weighs 390lbs., and is 4ft. long, by 7in. in diameter. The clock has but three wheels in the going train. The pendulum of the Clock Tower in the Houses of Parliament is only 15ft. long.

Mr. Morton, the manager of the Oxford Music Hall, attributed the fire which consumed a portion of the building last week, to the cocoa-nut matting having caught fire by a lighted fusee. Mr. Treloar, the manufacturer, states that cocoa-nut matting is uninflammable, and he is right. We have during the week tested the flammable qualities of cocoa-nut fibre, and find that Mr. Treloar's statement is correct.

A canal embankment at Horsley, near Birmingham, gave way on Friday last. The canal was drained for nearly a mile, and considerable damage was done by the rush of the water. The accident, it is conjectured, was caused by mining operations underneath the embankment.

The Metropolitan Traffic Regulation Act passed towards the end of last year contained certain provisions against removing dust and ashes, and unloading brewers' drays in the streets between the hours of 10 a.m. and 6 p.m. Notwithstanding, we notice that the practices are still continued in various parts of the metropolis. The police, we believe, have been spoken to individually, and have stated that they have received no instructions on the subject, so that one of the most beneficial clauses of the Act seems likely to remain in abeyance for the want of some authority to enforce proper attention to its requirements.

Mr. E. W. Pugin has sent us a long letter on Dr. Barry's pamphlet, but it reached us too late for insertion. The letter contains the following enclosure which throws some light on the missing letters which Mr. Pugin sent to the late Sir Charles Barry:—

"Dear Pugin,—In reply to your letter asking me what I remembered about the late Sir Charles Barry's letters to your father, I can state that in the year 1860 the whole correspondence which you have now made public, together with the letters given to Sir Charles Barry, were for a time in my hands. These letters I had examined and put aside for the purpose of writing, as you remember, a biography of your father; the idea of which I only gave up on hearing that Mr. Ferrey had already a portion of his 'Recollections' in type.—Yours sincerely, EDMUND S. PURCELL."

Another of the old landmarks, so many of which have disappeared recently to make way for modern improvements, is doomed. The Saracen's Head, in Snow-hill, has been closed up and will shortly be demolished. This was a very famous hostelry in the old coaching days. A former house on the same site is described by old Stowe as "a fair and large inn for the receipt of travellers."

The study or at least the use of the science of heraldry seems to increase. In the financial years 1855-56 the tax produced in Great Britain only £53,769; in the year 1865-66 it produced £65,034. A return which has been issued shows that last year the tax was paid by 55,603 persons; 15,077 of them, keeping four-wheeled two-horse carriages, paid a tax of £2 12s. 9d. each, and the other 40,526 paid 13s. 2d.

The Government has consented to include in the estimates for the current year an additional sum of £800 to the Royal Irish Academy. The increase in the annual grant was recommended by a Committee of the House of Commons some time ago.

The fifteenth anniversary of the London Association of Foremen Engineers was held on Saturday evening, at the City Terminus Hotel, Cannon-street, Mr. Whitworth, LL.D., F.R.S., in the chair. Mr. E. J. Reed, Mr. Samuel Smiles, and others spoke during the evening. The society is in a flourishing condition.

Ludgate-hill is gradually being widened. Two houses on the left hand side going up are being pulled down, and the new buildings will be considerably set back. Three more are to follow. The corporation have been treating for the frontage to throw the extra strip into the public way. That of the two already coming down is 50ft. by 15ft. 6in. deep, 775ft. superficial area, and the British Prudential Assurance Company, who are the owners, ask only £28,720.

A correspondent gives us an instance of architectural restoration in Italy which shows that we English are not alone in our perpetration of shams. The Archive Office at Pisa is being restored with great taste, and the finished portions of the work display considerable archæologic study, and reflect great credit upon all who had a hand therein. But it was decided that the work was not to look like a restoration, but should wear the appearance of a genuine relic of antiquity, and so the artists employed were directed to anticipate the injuries of time by smudging their work here and there, by chipping pieces every now and then out of the new walls, by toning down their tints, and by introducing artificial discolourations, purporting to be the result of age and damp.

The Council on Education at South Kensington have promised to supply a series of works of art of the highest interest and value to the Leeds National Exhibition, to be exchanged at intervals for others from the museum of the department. The colleges of Oxford and Cambridge supply some rare specimens of plate of the fourteenth and sixteenth centuries, presented by the founders. Mr. W. Bragge will supply a choice collection of illuminated MSS., and a selection from his interesting collection, illustrating the history and use of tobacco in all countries, &c. The Earl of Chesterfield will send the celebrated Chelsea vase, companion to that in the Foundling Hospital, jewelled cabinet, plate, &c. Several of the city companies have consented to allow their early loving cups, and other objects of interest, to be exhibited. There will also be a display of civic insignia from Oxford, Chester, York, Lincoln, Leeds, Scarborough, Richmond, (Yorkshire), Preston, Shrewsbury, and other municipal towns.

A remarkable sacrilege was discovered on Tuesday at Bolton, where a new church is being erected, at a cost of £30,000. The foundation stone was laid in April, and, as is customary, a number of coins and documents were deposited in a cavity prepared for their reception. Yesterday morning, however, it was found that, with the help of a large crowbar, the stone and brass plate below which covered the cavity were removed, and the articles deposited abstracted. Then the thief appears to have replaced the plate containing the inscription in its original position, and carefully mortared it in, so as to conceal the robbery. A description of this church, which is from the design of Mr. Paley, of Lancaster, appeared in the BUILDING NEWS of May 3, 1867.

The Hotel de Porta-Vecchia at Desenzano, in the province of Brescia, Italy, built upon piles on the shore of the Lake of Garda, is gradually sinking at the rate of about six inches a day; the ground floor has already disappeared. This immersion is taking place imperceptibly, and without any shock. Every means of preventing it have been employed, but without avail. Numbers of persons have come from a distance to witness this singular spectacle. The proprietor of the hotel, who was at first in despair at his misfortune, at length determined to charge a fee for admission to the house, and has already received a sum of money which will go far to compensate him for his loss. A scientific commission is about to visit the spot to open an inquiry.

Traces of a large and ancient town near Castranova, in Sicily, high up on the plateau of the Cassera Mountains, have been discovered, and excavations are to be set on foot without delay. Professor Cavallero, director of the Archæological Museum, has had a minute topographical plan of the ruins prepared, and it is confidently believed that discoveries of considerable interest will be made.

MEETINGS FOR THE WEEK.

TUES.—Institute of Civil Engineers,—1. Renewed discussion on "On the Supplanting Power of Piles," and 2. "On the Manufacture and Wear of Rails," by Mr C. P. Sandberg, Assoc. Inst. C.E.

WED.—Society of Arts, "On a Daily Mail Route to India," by Hyde Clarke, Esq., D.C.L.

Wed. Geological Society.

FRI.—Architectural Association, "The Architecturesque," by Professor Kerr, F.R.I.B.A.

SAT.—Associated Arts Institute Conversazione and Exhibition of Students' objects. "Twilight" and "Hamlet," Shakespere.

Trade News.

TENDERS

BAYSWATER.—For rebuilding 22, Queen's road, Bayswater. C. Bates, architect:—

John Clemetson	£2195
Dawson	2176
Aldred and Doulton	2167

BARNET.—For the building of a rectory house at Berkeley, near Grimsby. Messrs. Thomas C. Hine and Son, Nottingham, architects:—

Hobson Brackley	£2450
William Tickelpenny	2398
F. T. Kidd	2198
Thomas Enderby	2164
Rand T. Hollingsworth	2100
Simpson and Lyham	2072
J. Barker	1999
William Lillor	1995
J. Ellis	1985
Riggall and Howins	1979
Coulson and Haywood	1871
J. M. Thompson	1824
R. Young (accepted)	1730

BRIXTON.—For building two houses and shops in the Brixton-road, S., for Messrs. Nicholl and Sainsbury. Mr. C. H. Driver, architect. Quantities by Mr. R. O. Harris:—

Seton	£4118
Maxwell	4018
Manley and Rogers	3948
Taylor	3847
Jackson and Shaw	3837
Axford	3790
Thompson	3779
Perry	3655
Nutt and Co. (accepted)	3440

DULWICH.—For the erection of a detached residence in the Underhill road, Lordship lane, Dulwich, S., for Mr. L. L. Toll:—

Mitchell (accepted)	£1137

ESSEX.—For restorations, &c., to Chrishall Church, Essex. Joseph Clarke, Esq., F.S.A., architect. Quantities by Mr. Rackstell:—

Hunt, Hobbleston	£3267 0 0
Gibbons, Buntingford	2500 0 0
Runacles, Halstead	2415 3 0
Roberts, London	2410 0 0
Bracher and Son, London	2300 0 0
Glasscock, Bishop's Stortford	2100 0 0
Bell and Son, Saffron Walden	1960 0 0
Grimson and Whitehead, Royston	1906 15 0
Brown, Lynn	1895 0 0
Tooley, Bury St. Edmunds	18 0 0 0
Mason and Green, Haverhill	1700 0 0

LONDON.—For alterations and repairs to house in Charlotte street, for Mr. M. Gabriel. Mr. W. A. Baker, architect. Quantities furnished by Messrs. Richardson and Waghorn:—

Brown	£588
Ward	565

LONDON.—For the erection of two shops in Euston-road, for Mr. Woolridge. Mr. W. A. Baker, architect. Quantities furnished by Messrs. Richardson and Waghorn:—

Hutchman	£1807
Williams	1787
Eaton and Chapman	1769
Cooper and Cullum	1660
Scrivener and White	1624
Kelly, Brothers	1614
Mitchell	1495

LONDON.—For alterations and repairs to three houses, Charlotte street, and No. 1, Berners-street, for Mr. Watson and others. Mr. F. F. Hedgworth, architect:—

Matthews	£1940
Bywaters	1859
Hackham	1868
Kelly	1863
Manley and Rogers	1799
Cars and Murdoch	1436

LOWER NORWOOD.—For the alterations and additions about to be carried out at the Parish schools, Lower Norwood, Surrey, for the Board of Guardians of the Parish of St. Mary, Lambeth. The quantities were taken out by Mr. Gould, of 20, Great George street, Westminster:—

Wardle and Baker	£3050
C. Fill	2987
Davies	2937
Prebble Brothers	2930
Henshaw	2921
J. Thompson	2920
Carter and Son	2898
Grammon and Son	2777
Lacey and Flatman	2700
Nixon and Son	2647
R. Eustace	2640
W. W. Stevens	2633
George	2602
Knight	2598
Nutt and Co.	2521
Patton and Smith	2415
Cooper and Cullum (accepted)	2359

LONDON.—For dwelling house in Portpool-lane and Half Moon-yard, Gray's Inn road, for Mr. W. Jarvis:—

Langmead and Way (accepted)	£2,000

NORMANTON.—For the erection of villa residence at Normanton, near Derby, for Charles Brentnall, Esq. Messrs. Thomas C. Hine and Son, of Nottingham, architects:—

E. Thompson	£1577
C. Humphries	1506
R. Bridgart	1492
J. W. Thompson	1433
G. Lilley (accepted)	1429

WIMBLETON.—For the Dog and Fox Tavern, Wimbledon, for Messrs. Young and Bambridge. Mr. George Adam Young, architect. Quantities by Mr. C. J. Shopple:—

Mason	£3550
Axis and Son	3395
Nicholson and Son	3336
Adamson and Sons (accepted)	3160

WISBEACH.—For building the Primitive Methodist Chapel. Mr. James Kerridge, architect:—

Bennett	£1586 8 3
Girling (accepted)	1546 0 0

WORCESTER.—For New Schools and Chapel-keeper's House, Sansome Walk. Mr. G. Johnson, architect:—

Hemming and Son	£1500 0 0
Beard	1500 0 0
Kendrick	1397 0 0
Higgs	1390 14 0

PROPERTY SALES.

FEB. 11.

AT THE MART.—By Messrs. Foster, Leasehold residence, No. 21, Albany street, Regent's-park, term 32 years unexpired at £12 per annum—sold for £660.

Freehold, 5a. 0r. 15p. of building land, situate in Station-road, Colney hatch—sold for £1,610.

By Messrs. Elgood and Son.—Leasehold residence with stabling, No. 6, Montagu-square, let on lease at £135 per annum, term 33 years unexpired at £21 per annum—sold for £1,400.

Leasehold residence, No. 53, Montagu-square, let on lease at £120 per annum, term and ground rent similar to above—sold for £1,330.

Leasehold ground rent of £21 per annum for 33 years derived from No. 8, Montagu-square—sold for £350.

Leasehold ground rent of £21 per annum for 33 years derived from No. 9, Montagu-square—sold for £340.

Leasehold ground rents amounting to £70 12s. per annum for 33 years, derived from seven houses in Park-place, Regent's park—sold for £1,100.

Leasehold ground rents, amounting to £29 8s. per annum for 33 years, derived from four houses in Park-place, Regent's-park—sold for £480.

Leasehold, four houses and premises, Nos. 24 to 27, Buckingham-place, Fitzroy-square, producing £180 per annum, term 20 years unexpired, at 2s. per annum—sold for £1,820.

Leasehold ground rent of £5 per annum, for 20 years, derived from 381, Euston road—sold for £50.

FEB. 12

AT THE MART.—By Messrs. Vigers.—Freehold, two plots of building land situate at Herne hill—sold for £300.

Freehold building land, fronting Poplar walk, Coldharbour-lane, Camberwell, and a lease for 1,000 years of a railway arch—sold for £520.

Freehold, two plots of building land, situate as above, and a lease for 1,000 years of four railway arches—sold for £310.

Freehold plot of building land, fronting Coldharbour-lane, Camberwell, and a lease for 1,000 years of four railway arches—sold for £430.

Freehold cottage, No. 6, Avenue-cottages, Avenue road, Camberwell, let at £15 12s. per annum—sold for £300.

Freehold, seven houses and shops, Nos. 138, 140, 144, 146, 148, 168, and 170, Camberwell road, producing £265 per annum, also a plot of building land in the rear—sold for £6,480.

Freehold residence, No. 6, Charlotte street, Sutherland-square, Walworth road, let at £26 per annum—sold for £450.

Leasehold residence, No. 13, Sutherland street, Walworth-road, let at £26 per annum, term 70 years from 1841, at £4 11s. per annum—sold for £310.

Freehold, two plots of building land fronting Wellington-street, Brandon-row, Newington-causeway, and a lease for 1,000 years of a railway arch—sold for £420.

Freehold plot of building land fronting Brandon-row, and a lease for 1,000 years of a railway arch—sold for £410.

Freehold, two plots of building land fronting Tiverton-street, Newington-causeway, and a lease for £1,000 years of a railway arch—sold for £400.

Freehold house, No. 36, Tiverton-street, and lands adjoining, with lease for 1,000 years of two railway arches—sold for £400.

Freehold two plots of building land fronting Newington-causeway, with a lease for 1,000 years of nine railway arches—sold for £430.

Freehold house, No. 3, Hill street, Wellington street, Blackfriars—sold for £230.

Freehold, house, No. 60, Great Suffolk-street, Blackfriars—sold for £420.

FEB. 14.

AT THE MART.—By Messrs. Farebrother, Lye, and Wheeler.—The valuable literary property, known as the "Evening Mail" newspaper, having an extensive British and foreign circulation, and which has produced during the five years ending December, 1866, an average net income exceeding £1,200 per annum—sold for £2,000.

By Messrs. Winstanley and Horwood.—Freehold mercantile premises, being No. 28, Friday-street, and 50, Bow-lane, Cheapside, estimated to produce £670 per annum—sold for £7,720.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

C. G. Braxton, Portsea, builder, Feb. 26, at 1. K. Chandler, jun., Claude road, Peckham Rye, builder, Feb. 26, at 1. Thomas Gilbert Bell and John James Elphinston Robertson, Charing-cross, surveyors, March 2, at 2. Frederick Chadwick, Croydon, surveyor, March 4, at 12. Charles Jupp, The Triangle, Mare street, Hackney, builder, March 2 at 11. George Knight, Great George street, Westminster, contractor, March 4, at 1. Joseph James Rawlings, Melbourn, Cambridgeshire, engineer, March 4, at 2.

TO SURRENDER IN THE COUNTRY.

Samuel Gaunt, Hulme, painter, Feb. 29, at 9.30. John Roskilly, Wendron, Cornwall, mason, Feb. 22, at 10. John Prince Busby, Risborough, plumber, March 12, at 11. John Coleman, Ewell, surveyor, Feb. 29, at 12. Francis William Vigus, Exeter, timber dealer, March 4, at 12.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

March 9, G. Hayward, Hawkhurst, plumber. March 9, T. Adams, Ore, Sussex, builder. March 11, G. W. Weatherhogg, Horton-in-Lindsey, engineer. March 16, W. Aston, Great Crosby, Lancashire, builder. Feb. 24, J. Smith and J. L. Ibbotson, Barrow-in-Furness, joiners. March 13, D. Gaved and W. H. Rakett, Penge, builders. March 17, H. Hughes, Hanover street, Carlton road, Kentishtown, builder. March 16, W. Vaile, Birmingham, builder. March 11, J. Fitchett, Manchester, plumber. March 5, T. Barrowclough, Sheffield, builder. March 18, J. Parsons, Plymouth, builder. March 19, H. W. Hulbert, Cirencester, painter. March 5, J. B. Stone, Brighton, painter.

DIVIDEND.

March 17, F. W. Mowbray, Leicester, engineer.

SCOTCH SEQUESTRATION.

William Macnab, Duncan M'Callum, and Robert M'Nab, Greenock, engineers, Feb. 25, at 12.

PARTNERSHIPS DISSOLVED.

W. and R. Bullows, Castle Bromwich and Erdington, builders. Sutcliffes and Co., Bradford, Yorkshire, plumbers. Smitbers and Co. Great Horton and Brighouse, slaters.

DECLARATIONS OF DIVIDEND.

S. C. Anning, King's-cross road, gasfitter, dividend 5d. J. J. Myers, Southampton, engineer, dividend, 2s. 8½d. Bennett and Higuett, Liverpool, timber merchants, 8½d.

THE BUILDING NEWS.

LONDON, FRIDAY, FEBRUARY 28, 1868.

ARCHITECTURE AND "INDEPENDENT DISSENTERS."

"Some fell upon stony places, where they had not much earth, and forthwith they sprung up, because they had no deepness of earth; and when the sun was up they were scorched, and because they had no root they withered away."

NOTHING could more justly describe the state of meeting-house architecture, as set forth in the Congregational Year Book for 1868, than the words just quoted. In the whole field of modern art there is no patch so utterly worthless, because of its superficial deceptive character, as that occupied by Nonconformists. If we compare for a moment the current Year Book with former years, we cannot hesitate to return a verdict altogether against the present, and altogether in favour of the past. The seed of the architectural revival was sown for Dissenter as well as Churchman. The Year Book at first gave evidence that the seed had been received with joy; but lately the evidence is just as conclusive that this joy had no real enduring root. In a word, there is no feeling in their architecture, or nothing, to put it in another way, which corresponds to what the Churchman understands by the word "symbolism." This is the first cause of that barrenness, and those abortions which are worse than barrenness, so manifest in most of the buildings which owe their origin to Nonconformists. But it may be said, "buildings may be good, and yet have nothing to do with symbolism. The market-house, the railway station, and the bank, may be decent buildings enough, and yet not possess a spark of symbolism. Engineering works, possibly, but not necessarily barren or monstrous." This is undoubtedly true, and suggests at once the second force which operates with such a depressing tendency on what is called "chapel architecture." This, broadly stated, is pride. If Dissenters and their architects could be content with the practical business questions of, first, how to seat a given number of people so that all should see and hear the minister well; and, second, how to do this at the least possible expense compatible with one thing only, viz.—the dignity of religion, we might have plain but well proportioned buildings erected, the grand simplicity of which might frown down the weak fritterings of both Anglican and Roman buildings, and could not but have most beneficial effects upon the architecture of the future; but this, the Congregational Year Book shows us, is not the policy of the "Independent Dissenters." In architecture, as in some other things, they seem to have a strong desire to be mistaken for Anglicans, or, at any rate, to possess all the privileges, architectural and otherwise, of the National Church. Thus, out of twenty-one meeting-houses twelve have towers and spires; one has nave, aisles, and transepts, all outwardly expressed in flank as well as in front; and all the others are mere variations of a mean compromise between the one span roof demanded by his conditions of arrangement, and that idea of an Anglican church (nave and aisles) which is so essentially the Nonconformists' idea, and beyond which it seems impossible for them to reach. The most churchy of these works are described as "English Congregational Church, Swansea," and "New Congregational Church, Tenby," both by Messrs. Paull and Robinson. Mr. Pritchett follows closely in their wake. His towers and spires are 120ft. high, and that at Ilkley, we are informed, "is handsome, with no doors or windows in the spire to mar its beauty and its symmetry." What a pity this principle was not applied to the rest of the building.

We have mentioned these architects because they really do appear, in one or two of their works, to have learnt something of the art of architecture somewhere or other. So, too, there are many worse buildings than Mr. Moffat Smith's slight and unpretending round arched work at Builth Wells; whilst Mr. Sutton, in his "Chapel, Pembroke Dock," has gone near to one fair solution of the problem with which the architects of "Nonconforming churches" have to contend, by adopting a design of two storeys, and thus accentuating externally the internal arrangement of a galleried hall. Messrs. Innocent and Brown would have deserved our highest praise for their architecture, but, unfortunately, they have confounded boldness with coarseness, and have followed a trifle too closely upon the track of Mr. Bentley. Of the other designs it is almost impossible to write. Mr. W. F. Poulton, of Reading, seems to be the most popular or the most pushing, for we find his name attached to four designs, one the frontispiece. Like Mr. Sutton, this architect has got sense enough sometimes to confess externally the two storeyed nature of the building; but here we must do Mr. Sutton the justice to say all likeness ceases. There probably does not exist in Europe an architect who could equal Mr. Poulton in combining the height of pretension with the worst of proportions and the weakest of details. We say this most emphatically, not merely upon the evidence in the Congregational Year Book, but from the evidence of the works themselves. Of Mr. Poulton himself we know absolutely nothing. Of his works, unfortunately, we know too much; and we have no hesitation in selecting their author as the representative of the most barren patch in the whole estate of modern architecture. If Mr. Poulton, like Mr. T. C. Clarke and many other architects who now and then equal him, had but an ordinary share of work, we should have had very little to say. There are, however, men upon whom, from some cause or other utterly foreign to art, opportunities to do something for art thickly crowd, but ever with abortive results—men whose works are so plentifully scattered that they (the works) must either become a general joy or a general nuisance. Mr. Poulton bids fair to be one of these, if he has not already secured that proud distinction. Of course every one knows "success" is a shield. Of course every one also knows that "success" means money, or the outward sign of it. An architect who we know has ten times his share of work, who possesses a private secretary, and is always in a railway carriage, may after all be comparatively poor; but his "success," to all appearance, is the same, whether he leaves his eldest son penniless, or the heir to rich estates. We have nothing to do with anything but the works executed. We know very well that some so-called architects hold their professional services so cheaply, that rather than lose a building they would do the work for nothing; whilst many receive 2½ per cent., 1½ per cent., nay, even a five-pound note. And some get known as "subscribers" to all places of worship, their subscription varying from 2½ per cent. to 5 per cent.! However, these are matters of professional practice with which we are not at present concerned, and we only mention these ways of doing business to show that the "success" does not always mean *real* money, but that the "success" itself is as often a sham as the means whereby it has been achieved. Real success in any art pursuit must be owing to real art merit, and that alone. With all other kinds of success we are at open war, convinced that it only wants open war and fearless speaking to show the rottenness of the shield behind which men skunk, and the rustiness of the armour in which they encase themselves. We fully believe the success of many architects to be intense shams. Bullying an ignorant public, pandering to a grasping committee, or buoyed up by the merits of a never-mentioned clerk, some men ride architectural greatness. Others, avoiding the meannesses of life, but having presentable persons, with a good deal of *savoir-faire* and a *soupçon* of *savoir-vivre*, ride by their sides—a goodly company, and richly dight. If you would find the artist—the architect who lives for art, whose power is in his own right hand, and who has neither shield nor breastplate—you must seek him in bye-ways and in quiet valleys, and not in the crowded thoroughfares. You may hear of him in country houses, but his name is unknown upon notice boards or placards. You say, "It is all very fine to find fault, and easy enough to be a critic. Show us a remedy." This is precisely what we propose to do. A meeting-house, if it means anything at all, should be as distinct from a church as the Separatist or Nonconformist is from the Churchman. This is not the place to enter upon matters of faith, doctrine, or discipline; but any child knows that, whilst the model Churchman takes delight in all kinds of art which can add glory to his church—in colour, everywhere, on wall, window, and vestment; in the goldsmith's art, on cross and chalice and retuble; in the embroiderer's art, on cope and chasuble and altar; in the illuminator's art, for his gospels and his psalter; in painted figures on glass and walls; in carvings and sculptured figures; in storeyed floors of encaustic tiles or rich mosaic—the model Nonconformist turns away from these things, and more or less despises them. In the one case, it is the altar and its service; in the other, the pulpit and the preacher. This is the central idea—*a pulpit and a preacher*. The thing desired is—place for a given congregation, so arranged that they may be disposed round about the central idea, all hearing and seeing well the preacher. Now it is manifest, first, that all—no compromise, but all—pillars, no matter what size, are more or less in the way. Second, that galleries, in cases where large congregations have to be provided for, are indispensable. It will be easily seen that any plan which is at all founded on the principle of nave and aisles, is radically wrong. We go further, and say that any plan founded on the Basilican type is wrong. The logical outcome of making the pulpit the nucleus of the building is, to put it broadly, that the main angles of the seated space should fall as near as possible on the semi-circumference of a circle, whose centre is the pulpit. The laws of acoustics will enable us to make certain modifications, more or less assimilating to the ordinary theatre type, by elongating the semicircle, or by breaking in upon it, as in the Théâtre Historique, Paris. Some Early Domical churches also afford most suggestive types for buildings adapted to what is called Congregational worship; for example, the churches of Sta. Fosca, Torcello; St. Lorenzo, Milan; St. Front, Perigeux; and our own Templar churches. We are bold to say that, even the adoption of the ridge and furrow principle of roofing on a square or nearly square plan, with deep iron girders, and windows high above the galleries, arranged somewhat as at the Duomo at Ferrara, would be incomparably better than the foolish shams and paltry parodies of Roman and Anglican architectural forms now in vogue. To continue such a puerile practice can only end one way. We may be called hard names, we may be rebuked for being too severe, we may have all sorts of unkind motives attributed to us, but we care not. The condition of modern architecture shows more clearly every day that it is high time we left off mincing matters. We have spoken boldly to our Nonconformist readers, feeling earnestly assured that the course they are pursuing only tends to bring down upon them the ridicule, if not the contempt, of all artists and art-educated men.

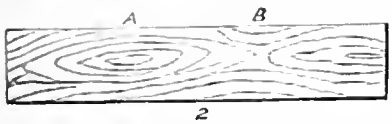
MARKS ON DEALS AND QUALITIES OF TIMBER.

CONCLUDING REMARKS.

WE have now to notice the qualities of timber in connection with the process of conversion. Hewn timber is mostly prepared with the axe in the neighbourhood of the forest; but with Memel or Dantzic timber we are familiar from the saw. Their qualities are decided by their outward appearance: if taken in a large body of new clean wood (avoiding the heart or central portion), it will show few imperfections; but, if it bespeaks a robust tree, with many branches, it will figure up coarse and inferior; if the knots are dead, and have been covered with an outer covering of new wood, only to show its imperfections under the process of sparing, so much the worse, as these dead knots may often bespeak decay at the heart; loose or tender hearts, ring shakes, and an abundance of soft wood may cause logs to be branded seconds or thirds quality. With some shipments size is the leading feature. Crown, or first quality, logs are free from all outward imperfections, still they may have numerous evils in the interior, such as decayed knots and diseased or wandering hearts. By this last remark we imply those logs where the heart does not run straight from end to end, but will traverse from one side to the other; such logs are to be avoided where strength is required, and may easily be detected by their outward appearance—thus No. 1 would open

1

straight, and No. 2 would have a wandering heart. It is not an easy matter, when judging from one side only, to say with certainty



2

whether the heart is nearing or receding from the surface; perhaps the best rule is to observe the conduct of the sap. If sap is present at the edge at B, and the edge at A is heartwood, we have proof that the heart is nearing the surface at the latter point, and the opposite case if the relative position of the sap is changed. Sawn or converted deals are far less liable to become a loss in the hands of the builder, as they are reduced to the required size, and may be inspected upon all sides. When under the process of conversion from the tree, the logs may be cross cut to the required length, or the trees may be cut up the whole length. The latter plan was formerly adopted, and the butt ends of the planks were cut off as far as they were perfect, or would hold their width without imperfect or wavey edges. In this case the planks would be laid flat upon one another, and passed through the sawmill again to be edged or taken to a parallel width, thus producing 11in., 9in., or 7in. planks. In some of the common shipments of Swedish and Canadian goods, this edging is done with the circular saw; of late years the principal makers have adopted the plan of cutting the logs to the required lengths and taking them to a width before cutting into planks—this principle enables them to convert the slabs into narrow battens or boards which are shipped as small as 5in. by 2½in. and 5in. by 1in., still preserving their distinctive qualities. The conversion of the heartwood, which should be the best portion, is a matter of the greatest concern. Where 4in. deals are manufactured, a plank of this thickness is generally taken from the centre, the next cutting producing 3in. deals, and the outer portions thinner deals and boards. As a rule, 1in. deals are always heart planks, and 2in. or 2½in. deals are free from heart. As we cannot rule the qualities of timber, nor set aside the laws of Nature, we are compelled to have shakes and faults with the heartwood, and with the sound or outer wood we have another evil to contend with, in the shape of sap. With the Russian shipments, the standard is 3in. by 11in. and 3in. by 9in. deals; 4in. or 2½in. deals are scarcely known. We have thus the heart and outer wood all mixed together, which will explain their liability to come to our hands in a shaked condition. In selecting the qualities of these goods, the seconds and thirds deals are rarely fit for boards, whereas the Swedish goods of the same quality may be sound, and branded common from being coarse and wavey. With the Swedish goods we have the inner and outer wood converted into different classes of goods; hence their preference by practical builders. 4in. deals are never fit for boards. Knowing this, the foreign makers never brand them as best quality. Although they may be sold as best and seconds by our merchants, they are shipped as seconds and thirds. Not so with the 2½in. and 2in. deals, which are always from the outside or clean wood, and are branded in the usual manner. The best are selected for their cleanness and freedom from sap. The seconds may be a little coarse, and the thirds be distinguished by being coarse and sappy. For house purposes, common sense implies that these thin deals are superior to any other class. With Quebec goods the 2in. pines are far better than the 3in., and with the best Swedish shipments 2½in. and 2in. planks are the best goods that we find in the market. This principle of shipping thin deals and planks is new to our builders, and, as they deviate from the old-fashioned sizes they are accustomed to, they will not purchase them. This is another old-fashioned prejudice that should be exploded. Every builder raises his voice against the shaked quality of broad deals; and here is a class of wood selected for its freedom from hearts and shakes, neither of which may be found in a hundred deals, and he will not buy it, simply because it will not cut up so well as 3in. wood. That this prejudice exists we need no better proof than the fact of 2½in. and 2in. deals being 20s. per standard cheaper than 3in. A knowledge of the principle of conversion ought to teach our builders that they would occupy their true place if 20s. dearer than the ordinary class of deals. We would strongly recommend those in the habit of buying and using wood to give these thin deals or planks a trial. In Canadian shipments they are commonly known. In Swedish goods they are shipped from Gefle and Malmö, but from Russia they are seldom seen. A demand for them would soon cause a more plentiful supply, and, if the Russian makers could thus be led to adopt the Swedish, mode of conversion, we should have less fault to find with their shipments.

Qualities of timber are ruled, in some instances, by its manufacture. If the deals are hand-made—that is, sawn upon the side, and either chopped or sawn on the edges—they cannot be sold as best goods, as they have to be brought into competition with mill-sawn goods of true and regular make. Of late years the shipments of hand-sawn goods have been falling off, and mill-sawn goods have increased. This has centralized the trade, and it is now pursued mainly by machinery. The introduction of sawmills has caused great poverty in the rural districts of Sweden and Finland, and hand-sawn deals are becoming a thing of the past.

The qualities of timber, as defined or branded by the foreign makers, is not a binding law upon our merchants. They are subject to such a variety of evils, from leaving the sawmills to the time they are delivered into the hands of the builders, that their qualities or value may be materially changed. The goods we see in our home yards could scarcely be recognized by their makers; with the exception of their brands, they may have so changed in outward appearance as to lose their nationality. As the subject of "qualities of timber" possesses so many ramifications, each one being of sufficient importance to warrant a separate chapter, it is impossible to treat them as they deserve in the present series, we must, therefore, be content to skim over the surface, leaving the various details for our future numbers. With us the quality of timber is materially influenced by the presence of sapwood, and in good shipments of deals we often wonder where the makers' eyes were when they branded such-and-such a deal best quality. We must bear in mind that sapwood cannot be distinguished from heartwood when the trees are first felled. Perhaps of the two we should then prefer the sapwood, as it would possess the brightest colour, from the active state of the resin which would immediately exude from the pores, whereas at the heart all would be dead and opaque. From the time of the tree being felled to being conveyed to the sawmills for conversion the sapwood undergoes no change, except it may be at the end of the log, where light, heat, and moisture has acted upon it. In this case it will become green and stand out in bold relief from the heartwood, which maintains its natural colour. This discolouration of the sap is only superficial, and carries no influence with the deals when the log has passed through the sawmills. At this stage, from the fact of the sap being the same colour as the heartwood, it naturally follows the selection lays more with the knots and shakes. Shakes are not easily to be detected in newly sawn wood. Deals that will dry with open shakes may, when newly sawn, be overlooked, as these objectionable features assume no greater importance than a fine line, only to be detected by close observance. Deals in this newly sawn condition are piled in the yards or carted to the shipping stations, which in some cases are many miles distant. These piles are increasing in size during the whole of the winter, and are shipped after the ice is cleared from the rivers. There are generally two shipments from each port, called the first and second, or the May and September shipments. The interval between May and September being only four months, the amount of goods manufactured in that space is nothing compared with those made when the ports are closed. This winter season extends over eight months, or from September to May in the following year. In January and February the draft stock notes are sent to this country, and our brokers are then made aware of the quantity of stock which will then be ready for first and second shipment, and sales are accordingly effected. In the contracts it is always stipulated "that the goods shall be shipped in good condition." This is an important clause, and explains its own meaning. If the goods have been close piled at the sawmills or the shipping stations, and they have experienced a rainy season, then they are in a bad condition, as the sap has become discoloured. They are from thence stowed away in the hold of the vessel, and are transported to other lands in the warmest months of the year. Deals so shipped will be delivered from the vessel with the sap permanently discoloured and the goods reduced in quality. This change in the sapwood may be thus explained. The sapwood is the living portion of the tree, and is highly sensitive to the influences of light, heat, and moisture. When in a converted form, and piled damp in the yards, the moisture in the sap is as active as in the standing tree. As it is not able to expend itself in the branches of the tree or pursue its action to the formation of flowers and leaves, it assumes a low form in the scale of vegetation, and the pores become filled with fungi, which feed upon the volatile portions of the wood. The blue or green colour of the sap is nothing more than a low form of vegetation which has seized upon that portion of the wood in which life still lingers. It

may be set in motion by a shower of rain upon a summer's day, or it may insinuate itself throughout the tissue of the wood if the deals are piled one upon the other and no air space allowed between them. It does not follow that the goods may be kept in perfect condition if piled under sheds, but, generally speaking, they are best where so covered. If deals are sawn and piled in dry weather and are shipped in good condition, they may come to hand perfect in quality, with the sap as white and fresh-coloured as the heart. We are often presented with illustrations of this fact in the Finland goods. This is partly owing to its being a harder class of wood than we have shipped from Sweden. The sap is closer grown and more compact in its tissue, and is thus less liable to fall a prey to this secondary form of vegetation. To obtain deals in perfect condition they should be kept under cover and stripped for the free circulation of air, from the day they are sawn at the mills until they are delivered to the hands of the builder. Goods that are landed in this country in bad condition or which have—to use a shipper's term—"heated in the vessel," are somewhat lowered in quality, and it is no uncommon thing for a claim under this head to be made upon the foreign maker who could not have shipped them in good condition, agreeable with the terms of his contract.

The vicissitudes that timber is subject to cannot be said to end at this stage. They may be received in perfect condition, and well piled in the open yards, still a great portion of them may be damaged or deteriorated in quality as the same action will take place at the top of the piles and work itself down to a considerable depth. Such is the frequency of damage arising from this cause that it is a common excuse with timber merchants when goods are complained of that "they were the tops of the piles." Builders who are conversant with this fact will often buy their parcels of goods from the bottom of the piles. They will brand them with their own mark, and say "I'll take that lot when you get down to them."

Goods landed in bad condition may be somewhat improved by good piling, if they are received by the first or early shipments, as they have the warm days of summer to dry them; but if they are the second shipment, it is not possible to dry them in the winter season. During this damp, cold, rainy season the goods are absorbing all the moisture that comes upon them. Not only is the sap becoming discoloured, but the heart-wood is turning brown in patches with laying together. This is also the work of a fungus, which is spreading its gauze-like form between the timber and feeding on its very vitals. Goods so damaged are called "tender," foxey, tainted, or old deals, and before they are delivered into the hands of the builders are swept clean of this destructive fungus. When afterwards dry, this brown portion may be disturbed by a scratch of a finger nail, and, being only of a superficial character, it is little cared for. It is placed in work probably as bond, wall plating, or ground-floor timbers, where it may go on absorbing moisture. The half-destroyed fungus will again take action, and we are at a loss to explain how the building timbers in our new house have taken the dry rot. Taking but a cursory view of the present mode of management in the timber trade, we are convinced that great reforms are needed. The principal holders of stocks in this country care not to shed their timber, and the smaller merchants only have a care upon their best goods, whereas the common goods have need of the most shelter to keep them in a saleable condition.

Another condition in which goods may be sunk below the value implied by their brands may be noticed in the deck cargoes of the vessels. Converted timber is a light cargo, and when the hold of the vessel is full she is able to carry more weight. Goods are consequently piled upon the deck, and in that position are subject to many evils. It may be noted that deck loading is a condition imposed by the captain or owner of the vessel, who insists upon chartering to carry more timber than his vessel will hold. It is always a rule to make the deck cargo out of common goods, as they do not sink so much in value as good quality deals. These deck cargoes are in a wretched state when discharged, being wet, dirty, or discoloured by the sea water. They are generally piled and sold separate, at a reduction of ten to twenty shillings per standard, as they would spoil the general cargo if mixed amongst them.

We have spoken of the principal features connected with the qualities of timber, and, in conclusion, we may allude to a few exceptional matters which bear upon this point. As the timber trade is one of great magnitude, requiring a vast number of vessels in its service, we may naturally suppose that disasters are numerous. In one respect, timber is the safest cargo that a vessel can carry, for so long as she will hold together the cargo will cause it to swim. Hundreds of vessels, with their hardy crews, owe their ultimate safety to this fact, as, after weeks of suffering, they may be towed into some harbour with the hold full of water. In this condition they are called "waterlogged." In stress of weather the first step is to lighten the vessel by throwing the deck cargo overboard. If the vessel strains and springs a leak it is kept down by the pumps; but when once the hold fills with water, and the cargo begins to float, pumps are of little service. It is not our office to follow up these scenes of hardship and danger, as we have only to deal with the cargo. Deals, in a waterlogged vessel, will float from side to side, and grind themselves to pieces with the sand and ballast from the bottom of the hold. Their beating against one another will round off the sharp edges, and their incessant motion against the bow or prow of the vessel will destroy the square form of their ends. Goods so landed are in wretched condition, and scarcely saleable; but in many instances they are very little damaged, except by the water and other impurities attendant upon such a condition. In this case they are scarcely distinguishable from deck loaded goods, and they occupy the same position in point of value. Other goods are damaged by being cut to lie in the vessel; a corner may be chopped off, or a piece cut away for one of the ribs, &c. This is especially the case from ports where the timber is shipped large. Baltic and Canadian goods may be loaded without much damage, and the spaces between the ribs filled in with tramway sleepers, lathwood, or mining props. In this case it is termed "broken stowage." With distant ports, such as Georgia, Savannah, and Pensacola, from whence we draw our supplies of pitch pine, there is no broken stowage that they can profitably carry. The deals and logs are therefore damaged in being fitted into the hold of the vessel, and are consequently reduced in value.

DEAN STANLEY'S "MEMORIALS OF WESTMINSTER ABBEY."*

(SECOND NOTICE.)

THE Dean tells us in his preface that the work was undertaken in consequence of the kind desire expressed by many friends, chiefly his colleagues in the chapter of Westminster, on the occasion of the eighthundredth anniversary of the dedication of the abbey, that he should illustrate its history by memorials, similar to those he had published in connection with Canterbury Cathedral. With regard to the latter edifice, he "had the advantage of four marked events, of which one especially, the murder of Becket, whilst it was inseparably entwined with the whole structure of the building, was capable of being reproduced in all its parts as a separate incident. In Westminster no such single act has occurred." These historical memorials ought to be, in fact, the "History of England in Westminster Abbey;" this would have been a very extensive scheme, but the Dean has, to a certain degree, carried it out, as may be seen by the titles of the chapters of his book—Chapter I., "The Foundation of the Abbey;" chapter II., "The Coronations;" chapter III., "The Royal Tombs;" chapter IV., "The Monuments;" chapter V., "The Abbey before the Reformation;" chapter VI., "The Abbey since the Reformation," and an appendix, which is not the least interesting part of the book, inasmuch as it contains some new and very curious information. There are also one or two woodcuts, of which those at the end of the book, representing the position of the coffins in certain vaults, might well be omitted in a subsequent edition, for they are not cheerful subjects, and the book is eminently a cheerful and gossiping work. In the preface the Dean first of all gives a list of those of his friends to whom he is under obligation for aid afforded, and then a list of his authorities. Among the former the name of Mr. Burtt, of the Record Office, should be especially noted, as we find that he is now engaged in a thorough investigation of the archives of the abbey, which reach nearly as far back as the charters of the Saxon kings. The other manuscript authorities are the Chapter books, extending from 1542 to the present time; the Consuetudines of Abbot Ware, of which only the fourth part has come down to our time, but dreadfully defaced by the fire in the Cottonian library, A.D. 1731; the burial registers; the Precentor's book, and the MS. history of Flete. The chief printed authorities are the works of Camden, 1600; Keepe, 1683; Crull; Dart, 1723; Widmore, 1750 (the most correct of all as regards the history); Ackerman, 1812; Neale, 1818; and Mr. Scott's Gleanings, 1863; besides sundry other works, which, like those of Gough and Carter, treat of only portions of the edifice.

In Chapter I. the Dean relates, in a most charming manner, the old legends which attach to the various foundations of Lucius, Sebert, and the Confessor, in Thorney Island. The story of the Temple of Apollo, invented by the monks, as a counterbalance to that of the Temple of Diana, on Ludgate-hill, is not forgotten. No more are the wonderful legends of the Hermit of Worcester; of Edric, the fisherman, who witnessed the miraculous consecration of Sebert's church; or of the Confessor and the Pilgrim. The following description of the Confessor is extremely lifelike, and shows what archæology can do in the hands of an eloquent writer like the Dean:—"We know the Confessor well, from descriptions preserved by his contemporaries. His appearance was such that no one could forget. It was almost that of an Albino. His full flushed, rose red cheeks strangely contrasted with the milky whiteness of his waving hair and beard. His eyes were always fixed on the ground. There was a kind of magical charm in his thin white hands, and his long, transparent fingers, which not unnaturally led to the belief that there resided in them a healing power of stroking away the diseases of his subjects, &c." Now, this is the place where an antiquary would naturally wish to have the *ipsissima verba* of the original authorities. Unfortunately the only information contained in the footnote is, "Longis et interlucentibus digitis (Harleian Life, 240);" and it requires a further reference to the special authorities enumerated at the beginning of the chapter to find out that the Harleian Life is one of the lives of Edward the Confessor, published by the Master of the Rolls, under the editorship of Mr. Luard; and that it is the only one of the four that has any claims to be considered as almost contemporary. It should also be observed that both the date and the publisher's name (both essential for reference) are omitted. Chapter I. concludes with a woodcut of the abbey, as shown in the Bayeux tapestry. Could we have any faith in its accuracy it would almost lead us to believe that there were no aisles to the choir. Although this would

* "Historical Memorials of Westminster Abbey," by ARTHUR PENRHYN STANLEY, D.D., Dean of Westminster. London: John Murray, 1868.

seem to be contradicted, from the well-known passage from the Harleian Life, quoted by Mr. Scott, in his Gleanings, certain it is that the bases of one of the original choir piers, discovered last year by Mr. Scott, had certain peculiarities which were rather puzzling to account for, if we suppose it to have belonged to a detached pier.

Chapter II. commences with a vivid account of the Conqueror's coronation, and the doleful termination of the ceremony, when the Norman soldiers outside, alarmed at the shouts of the people, set fire to the abbey buildings. "Before the high altar, standing on the very gravestone of Edward, was the [illegible], crowned by William, the exact contrast of the sensitive, transparent king who lay beneath his feet. On either side stood an Anglo-Saxon and a Norman prelate. The Norman was Geoffrey, Bishop of Coutances; the Saxon was Alred, Archbishop of York, holding in his own hand the golden crown of Byzantine workmanship, wrought by Guy of Amiens." Now, two things in this description are apt to induce inquiries from the antiquary—and for neither are authorities quoted. Firstly, did William stand upon the tomb? The general authorities make him stand at the side of it. Most probably the said tomb was a raised one, with a bevelled top, more especially as we read of his presenting two palls to cover it, which could hardly be done if it were merely a flat stone. I think the authority in this instance is Sulcardus. The second point is, how the crown of Byzantine workmanship could have been the work of Guy of Amiens. That the crown to a certain degree resembled the Byzantine ones is apparent from the descriptions of the regalia made by order of the Commonwealth, before their sale or destruction; but we should remember that the species of crown in question appears to have been very common all over Europe at that time, and even later, as in the instance of the Crown of Constanza, the wife of Frederick II., found in her tomb, and now preserved in the sacristy of the Cathedral of Palermo.

The successive coronations, from William I. to Queen Victoria, are all described, interrupted only by the legend and history of the Stone of Scone, concerning which additional information is given in the appendix, with a woodcut, together with a geological account by Professor Ramsey. In 1865 the stone was withdrawn from the chair, carefully examined, and some particles subjected to chemical tests. The result of the Professor's investigations appears to be that it is a calcareous sandstone, probably of the old red sandstone formation; that it agrees with the rocks about Scone; and does not agree with those of the hill of Tara, or of Iona, or of Bethel, to all which localities its origin has been attributed. Chapter III., which treats of the Royal tombs, is by far the most interesting part of the book to the antiquary. We have part of an account of Henry III., and the motives which induced him to rebuild the abbey, and to rival that of St. Denis. But both architects and archæologists will protest against the paraphrase we find at page 127 of the following passage from Fordun:—"*In medio tumuli summitate Sti Edwardi reliquiæ conduntur et circa tumulum regis.*" Of course this means that the reliques of the Confessor were placed where they are to be found at the present day, viz.—on the top of the stone basement or tomb. The Dean, however, refers it to the raised floor of the Confessor's chapel, forgetting that in mediæval Latinity tumulus means a tomb, and not a mound of earth. The following is the passage:—"A mound of earth, the last funeral 'tumulus' in England, was erected between this the altar) and the Lady chapel, and on its summit was raised the tomb in which the body of the Confessor was to be laid." If we read the lives of St. Edward we shall also find that the arches underneath the shrine were for patients who came to be cured of other diseases than the "king's evil." Again, it is rather too bad to quote the "Gleanings on Westminster Abbey," page 150, in support of the very common and erroneous assertion that William Torel, the artist of the statues of Henry III. and Queen Eleanor, was an Italian, when two pages further on in the same work the following passage occurs:—"On the top of the Purbeck tomb is the *chef d'œuvre* of William Torel, goldsmith and citizen of London, who, for the honour of our country, appears to have nothing whatever to do with the Italian family of Torelli, as the name Torel occurs in documents from the time of the Confessor down to the said William; in fact, the attempts of various art critics to prove that the artist of this beautiful figure was an Italian are perfectly inexplicable, for, if we look at the contemporary Italian work at Pisa and elsewhere, we shall find that the English and French, so far from being behind the Italians in the thirteenth century, were, if anything, in advance of them." But there are two other slips of the pen which ought certainly not to have appeared in the work of a dean describing the monumental treasures of his own church. The first is the assertion that the ten knights who accompanied Edmund Crouchback to the Holy Land are carved upon his tomb. Now, the fact is that they were painted, but are now entirely obliterated. The carved figures, on the other hand, are all crowned, and probably represent his royal relations. The other slip occurs in page 169, where we are told, respecting the tomb of Henry V.—"Aloft are hung his large emblazoned shield, his saddle, and his helmet, after the example of the like personal accoutrements of the Black Prince at Canterbury. The shield is gone." Unfortunately for this assertion, both the saddle and the shield in question are actually engraved on the title-page of the book. They are represented as resting on the stone seat beside the coronation chair, a position they occupied a year or two ago, although they have probably been returned to their original place over the chantry of the king.

Concerning Henry's successor, we have in the appendix the depositions of the witnesses in the time of Henry VII., touching the arrangements made by Henry VI. for his tomb. He appears to have made sundry visits to the abbey for that purpose, and finally to have selected a spot between the Confessor's shrine and the tomb of Henry III., which spot was marked out by the mason. The Dean omits to tell us whether any of these marks are visible at the present day, but we learn that the reliques which stood on that identical spot were removed "to the place where they now stand, on the baksyde of the hyghe aulter." The curious part of the story is that in the archives of the abbey £500 are actually put down as having been paid for the removal of the body of Henry VI. from Windsor to Westminster.

Soon after this latter event, if it took place, we come to the building of the gorgeous chapel of Henry VII., an epoch which the Dean very rightly calls the beginning of modern England. Then we find foreigners invited over, and the beautiful bronze tombs cast by Torrigiano, which close the Middle Ages.

The Dean continues his work through the lines of the Tudors, the Stuarts, the Commonwealth, and the House of Hanover, ever telling his stories in the most pleasant manner; nor does the interest of the general reader at all slacken in Chapter IV., which treats of the monuments as distinguished from the Royal tombs. They are divided into groups, and each group affords fresh opportunities for anecdotes or eloquent passages, either from our best authors, such as Fuller and Macaulay, or from the Dean himself, who proves himself well worthy to take his place among them.

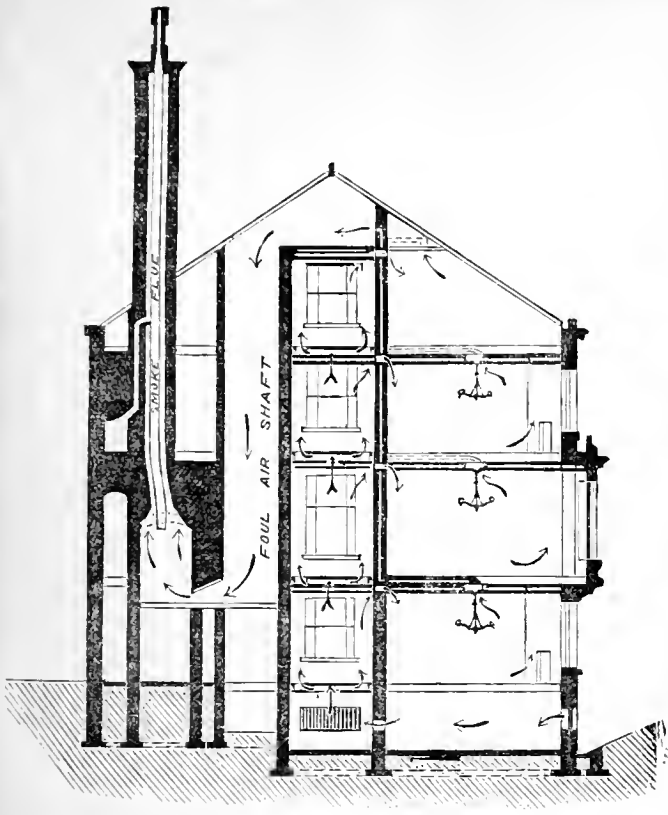
Of course this part of the work possesses very little interest to the architect or archæologist, but it really forms a very large portion of the whole book, and to the general reader will be quite as attractive as the former chapters. The work concludes with some chapters describing the conventual buildings, under the title of "the Abbey before the Reformation;" and another which treats of the events which have happened since that change of religion. The last chapter contains remarks respecting the changes of public sentiment towards the abbey, the various uses of the abbey, and the continuity of worship as practised in it. To sum up, Dean Stanley has produced a very eloquent and a very readable book upon the church of which he is so bright an ornament; but it is emphatically a book for the general reader and not for the archæologist, and there are also a few errors besides those mentioned above which will doubtless disappear in a second edition.

W. Burges.

THE LATE GEORGE GUILLAUME.

We regret to record the death, on the 15th inst., of Mr. George Guillaume, architect, of Morland-place, Southampton, a gentleman who ranked high as a provincial practitioner for nearly thirty years. Though confined to his house for many years past from a species of chronic rheumatism, brought on from the superintendence of sewerage works in an exposed situation, and an overtaxed constitution, Mr. Guillaume was to the last an actively-minded member of his profession. His earlier works, chiefly in Hampshire and the adjoining counties, attest an advanced taste in ecclesiastical architecture, an inventive mind, and a fertility of design that soon found a large field of local patronage. Curdridge Chapel; Sarisbury Church; Church of the Holy Trinity, near Owslebury; the reseating and partial restoration of the Priory Church at Christchurch, Hants; Church of the Holy Saviour, Bitterne; besides numerous additions and restorations, show an untrammelled mind and a correct taste. In the design and erection of residences for the nobility and gentry of the county, Mr. Guillaume had a large share of practice. Holly-hill, the seat of Lord H. Cholmondeley; Moorfields, the residence of E. Lomer Esq.; the offices of the Peninsular and Oriental Company, Southampton, &c., &c., indicate a varied practice in domestic and modern Classic design—all characterized by careful planning and general grouping of parts. In 1845 Mr. Guillaume obtained the surveyorship of the Marsh Estate, his plan for laying it out for building purposes having been selected in competition. Sewering and reclaiming a swamp from periodical overflows of the tide presented a difficulty not easily overcome. Mr. Guillaume's inventive powers were called into requisition, and by a self-acting system of tidal floats and flaps, together with reservoir sewers, the land became valuable building land, and is now the most valuable of the Corporation properties. From its funds the Southampton Corporation purchased other common fields in the centre of the town and laid them out as a public park. The design for this also was selected in competition, and Mr. Guillaume's plan was carried out. Mr. Guillaume's pen, no less than his pencil, was employed. He is the author of an "Architectural Restoration of Netley Abbey, illustrated by views and details:" a small work entitled "A Definition of Man;" besides other contributions of a mathematical character contributed to this journal. He was the inventor and patentee of a hydraulic oscillating and rotary machine, economic building bricks, &c. Of a kind and gentle disposition, and an active mind, his loss will be felt deeply by a large circle of friends.

Mr. J. J. Mechi writes to ask whether "Chimney pots are not a great mistake." He states that a heavy wind lately blew the pot off the chimney of his dining room without his knowing it. He was greatly surprised at the increased draught and consequent brightness of the fire, and subsequently removed the other chimney pots with a like result. He is satisfied that it is a mistake to have a large chimney for the escape of the smoke, and then by contracting its opening to neutralize the upper space. The narrowest portion of a chimney should be near the fire, where the rarefaction of the air is most intense, and the upward passage most rapid, and the chimney should rather increase than diminish in size upwards. He strengthens his assertions by adducing the experience of makers of railway engines, who now make all engine chimneys funnel-shaped or bell-mouthed.



NEW SYSTEM OF VENTILATION.

AT a recent meeting of the Liverpool Architectural Society, John W. Hayward, M.D., read a paper treating of some of the essential conditions of house building from a medical and sanitary point of view. After dwelling upon the importance of fresh air and sunlight, a cheerful lookout, good drainage, and thorough ventilation, Dr. Hayward proceeded to describe the practical carrying out of his ideas, which had been done in a house which he had erected for himself. He remarked that one of the greatest difficulties he met with was to obtain a site. He could not obtain a piece of land in a suitable neighbourhood with either an elevated position, a dry foundation, a south or south-east aspect, or with an inviting prospect. At length Dr. Hayward settled on a piece of ground on the east side of Grove-street, Liverpool. The great feature of his house, he went on to remark, was its ventilation.

I made the following arrangement of the plan of my house, which consists of basement, ground floor, and first, second, and third floor, viz. :—The basement is devoted altogether to the collection and warming of the fresh air. The ground floor is mainly store rooms and cellars, with stable and carriage house, &c, merely occupying the front with two professional rooms, a small cloak room and water closet, and the main entrance, with vestibule and stairs lobby, and servants' entrance and lobby. The first floor is my living floor ; on this is a drawing room, with ladies' dressing room and water closet ; a dining room, with lady's pantry and closets ; and a kitchen, with cook's pantry, larder, scullery, and butler's pantry. The second floor is the family bed rooms (four), with breakfast room, housemaid's closet, bath room, and water closet ; and the third floor is the servants' bed rooms (four), with children's play room, store room, and two water-cistern rooms. And above, beneath the ridge of the roof, is the foul air chamber, into which the foul air of all the rooms of the house is collected, and from which it is drawn by the kitchen fire, by means of a shaft passing down to the ground floor, and then ascending behind the kitchen fire and up the kitchen chimney stack round the smoke flue.

The principal part of the house consists of a front and back block, each of about 33ft. by 20ft., with a lobby 9ft. wide between them, running north and south. This central lobby is the warmed air corridor or ventilating lobby : it is lighted by a window at its south end, and it is shut off at its north end from the main staircase, vestibule, and front entrance by vestibule doors, which is essential to the keeping of it warm. Out of it open all the principal rooms of the house, so that it matters little whether the doors are open or shut. The front entrance, with vestibule and main staircase, are placed, not in the centre, but at the north end of the house. The main staircase runs between the vestibule in front and the kitchen stairs behind, and is lighted by an ample skylight. The servants' entrance and lobby are from the south, behind the ventilating lobby, and the servants' stairs run up between the main staircase in front and the kitchen behind. By this arrangement there is an easy approach from the kitchen to the dining room and drawing room, and to both the front and the side door ; and the lobby into which opens the door that lets in the cold air by being frequently opened, is shut off from that out of which the living rooms open, and which could not be if the entrance were in the middle of the front. The entrance should indeed always be at one side or end of the house ; otherwise there is no obtaining a central corridor, nor any possibility of keeping the lobby warm, or preventing the cold air let in by the open door from rushing directly up to the bed rooms. The entrance in the centre, is, I think, one of the greatest architectural mistakes I have met with, and a sure sign of an unevenly warmed house. The central corridor is an essential part of the house, and serves very important purposes ; it serves, of course, as lobbies to the rooms on each floor, and, by the introduction of gratings into ceiling and floor of each storey, it also serves as an open corridor from basement to attics. The only objection I know to this arrangement is that it necessitates the placing of some of the chimney-breasts in the external walls, and sometimes one in the front elevation. This is but little more than an architectural eyesore and a loss of heat.

Along the centre of the ceiling of each storey of the central corridor is an ornamental lattice work, two feet wide, and along each side of the floor above is an iron grating, one foot wide ; these allow the warmed air to ascend from the lobby beneath to the lobby above, but check it for the supply of each floor, and prevent it from rising directly to the top one.

Along beneath the opening in the ceiling of the basement of this corridor run five coils of Perkins's inch diameter hot water pipes. Fresh air enters into the lower part of this basement, and, rising, is heated by the heated pipes, and then passes through into the lobby of the ground floor, and thence into the lobby of the first floor, and thence into that of the second floor, and thence into that of the third floor, so that the central corridor is filled from the ground floor to the attics with fresh warmed air. Above the attic floor this corridor is continued to the slates and made into an air-tight chamber, under the ridge of the roof, to receive the outlets of foul air flues from the different rooms of the house. Out of this central corridor all the principal apartments of the house open ; and out of it, and out of it only, they receive their supply of fresh air. The cornice round the ceiling of this corridor, and that of each of the rooms opening out of it, has a lattice central enrichment, seven inches deep, and the wall between these two cornices is perforated by as many seven inch by five inch openings as the joists will allow, so that the fresh air has a free passage from the corridor into the rooms, even when the doors are shut. The drawing room has nineteen of these seven by five inch openings, making an inlet for fresh air of over four and a half square feet, distributed along the whole length of the wall of the opposite side of the room to the fireplace. The dining room has fifteen of these openings, making an inlet of considerably over three and a half square feet. Over the gaselier in the centre of the ceiling of each room is a perforated ornament, covering a nine inch square opening into a zinc tube, nine inches by four and a half inches, making an outlet for the foul air of forty and a half square inches. This zinc tube goes along between the joists of the ceiling into a nine inch by four and a half inch flue in the brickwork of the wall, between the corridor and the room above, where it is regulated by a valve. This flue rises up inside the wall and opens into the foul air chamber formed under the roof of the corridor. The flue from each room opens separately into this chamber ; and there is a similar flue also from the cloak room, the dressing room, the breakfast room, the bath room and the kitchen, and from all the water closets, even from the servants' in the basement : there are eighteen flues of nine inches by four and a half inches, making an inlet into the chamber of three feet four and a half inches square. Out of the north end of this chamber goes a brick flue or shaft, six feet by fourteen inches, taken from the back staircase, making an outlet of seven square feet.

This outlet or shaft goes straight down to below the first floor, and then crosses eastward and rises up behind the kitchen fireplace ; it is then collected into a square shaft of the same area. Up to the centre of this square shaft runs a circular earthenware smoke flue of 15in. diameter from the kitchen fire, leaving a foul air shaft of at least five square feet surrounding the kitchen smoke flue ; and these, together, form a large chimney stack, which is carried up to a greater height than any other chimney of the house, so as to secure a long syphon and strong draught. An intermediate foul air chamber, into which the flues from all the rooms of the house enter separately, and which is exhausted by one capacious syphon, is essential to the obtaining of an equal suction from each room ; otherwise the nearest flue would receive the most powerful suction, and the furthest perhaps little or none.

As I have pointed out, all the systems hitherto brought before the public have been defective in some of the points essential to efficiency and success, such as providing an inlet as well as an outlet, protecting the outlet against back draught, providing for the tempering of the air before it comes into the apartments, or some other point essential to efficiency and perfection, and they have deserved rather the name of "starvation" than "ventilation." This is not the case now, however, for I am convinced that the system carried out in my house is both theoretically perfect and practically effectual, and applicable alike to dwelling houses, hospitals, infirmaries, churches, schools, lecture rooms, concert rooms, manufactories, and every and any other building of whatever kind and for whatever purpose where ventilation not involving starvation is required, by simply making part of the basement a heating chamber and part of the roof a foul air chamber, and making the smoke flue of the heating apparatus act as a foul air exhausting shaft ; then, the outlets being in the ceiling, and especially if assisted by sun burner gas lights, they would take off the foul air more effectually at the time when the building is in use than at any other ; and the persons sitting near the doors or under the ventilators would not, as they are now, be in a cold draught, subjecting them to colds, rheumatisms, neuralgias, &c. ; and, by an arrangement to shut off the heating apparatus from the furnace, the fire may still be used for the foul air suction in summer, as well as in winter, and the foul air would be drawn away whether the gas was lighted or not, and without the building itself being heated when not required to be.

The expense involved is no great item, and will be less as builders become familiar with it : it is, of course, proportionate to the size and complexity of the building.

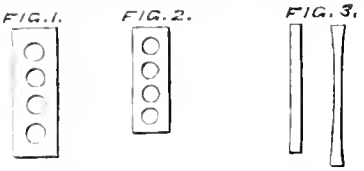
Mr. AUDSLEY thought the Society was very much indebted to Dr. Hayward for his admirable paper. It was certainly the most perfect scheme of ventilation he had ever seen brought forward. He might mention, as a curious coincidence, that, in designing a school upon which he was at present engaged, he had adopted much the same principle as that advocated by Dr Hayward for carrying off the foul air. Mr. Boult feared that very few clients of architects would be as liberal as Dr. Hayward. He hoped that at the end of twelve months Dr. Hayward would inform them of the results of his experience, for that information would be more satisfactory than the most sanguine anticipations beforehand. Dr. Drysdale said he had a house built upon the same principle as that of Dr. Hayward, in 1861, and, having let it since, the rent yielded a return of six per cent. upon the cost, including the land. The house was very much approved of by the persons who occupied it.

It was mentioned that the estimate was £3,300 for Dr. Hayward's house, including the stables.

PECULIAR PROPERTIES OF IRON.

TO assert that a bar of iron, after being subjected to a severe strain, is not only as strong, but actually stronger than it was previously to undergoing the infliction, appears at first sight to be contrary to the dictates of common sense. But, notwithstanding the apparent paradoxical nature of the assertion, it is perfectly true, and the statement, moreover, holds good, whether the material in question be acted upon by a strain of a compressive or of a tensile character. In the first place, let us consider the strain belonging to the former description. If a weight be placed directly upon a piece of iron, suppose so many tons upon a cylinder of iron 3in. high and 3in. diameter, the immediate effect of the compression upon it, produces a shortening of the cylinder, accompanied or unaccompanied, according to the magnitude of the weight and other circumstances, by a bulging out or spreading of the lateral dimensions. There is no absolute necessity for any bulging to take place, as experiments have demonstrated that cylinders tested in this manner to the breaking point, have sometimes fractured by a wedge splitting off at an angle, which is constant for the same material, without evincing any increase in their bulk. The shortening of the cylinder under the weight is *quam proxime* proportional to its amount, double the weight producing double the diminution in height and so on. When the weight placed upon the cylinder approaches near that which would crush the material, this proportion is not quite true. When a new, or hitherto unstrained, rod or pillar of iron is submitted to a heavy weight, it suffers a shortening which is partly temporary and partly permanent. Upon the removal of the load the pillar returns nearly to its original length, but not quite; in other words, the temporary shortening disappears but the permanent remains. The difference is termed the "permanent set," and may be expressed mathematically as follows:—Calling H the original height of the rod or pillar, and H' that which it retains after the removal of the load, and putting S for the "permanent set," we have $S = H - H'$. If the same load be now again placed upon the pillar, it not only causes a smaller compression than it did at first, but also produces no permanent change in the condition of the material. Upon the removal of the load the pillar is found to have received no second "permanent set," but to have returned to precisely the same height it had upon the removal of the load for the first time. Any further repetition of imposing and removing the weight produces no change in the pillar, so that, practically, it resists the action of the weight infinitely better, the second or third time of its application than it does at the first. Accordingly, as the amount of shortening, when a rod of iron is exposed to a compressive strain, or the amount of elongation, when it is under a tensile one, or the amount of deflection, when it is subjected to one of a transverse nature, has always been regarded as a measure of its strength, so, when the same weight produces no change in one pillar, while its effect is plainly observable in another, the former must be considered the stronger of the two.

It is not difficult to account for this somewhat curious fact, more especially if we assume that there is a certain distance between the molecules or component atoms of the material, at which they exert their maximum powers of resistance. If this distance, which will vary with the amount of the load, be greater or less, the full resisting power will not be called into play. In fig. 1, let us suppose the molecules of the cylinder to be at a certain distance, corresponding to that of their unstrained state, and not at that enabling them to exert their greatest resisting force. When a weight is placed upon the pillar it is compressed, and the atoms are driven closer together until that distance is attained, when the resisting power balances the compressive force, and there is equilibrium produced, as in fig. 2. The sum of the separate intervals, through which the atoms have been squeezed closer to one another, gives the total shortening or permanent set of the pillar. This state



being reached, it is easy to see that any repetition of the weight will not produce any permanent effect, though there will always be a small temporary compression, since the atoms have arrived at that relative position which places them in equilibrium with the force tending to displace them. Should a heavier load be placed upon the pillar there will then occur a second permanent set due to the action of that load, and the atoms in consequence must assume a fresh position, that is, one nearer to each other, in order to resist the increased amount of compression brought upon them. It must not, however, be imagined that this process of strengthening pillars, if we may so call it, can proceed *ad infinitum*. So soon as the weight laid on is sufficiently great to injure the "limit of elasticity" of the material, instead of any increase of strength accruing to the pillar, it is rapidly and seriously deteriorated in its powers of resistance. There should never be a load greater than one quarter of the crushing weight placed upon any piece of ironwork, and in many instances, this would be too near an approach to the ultimate strength of the material.

The property of acquiring strength by exposure to strain, is still more clearly and remarkably evident in rods and bars subjected to a tensile strain, than in short pillars submitted to direct pressure only. A similar explanation to the former can be given, but in this instance the molecules increase their distance from one another instead of decreasing them, in order to arrive at that particular limit, enabling them to exert the maximum resisting force against a tensile strain of a certain amount. Moreover, a diminution in sectional area attends the elongation of the rod, which remains together with the permanent set after the load has been removed. Fig. 3 shows the change of form occurring in an iron rod, after it has been heavily strained. It conducts itself in a precisely analogous manner to a pillar under compression, only the effects are visible in the opposite directions. The rod is lengthened, not shortened—the lateral dimensions are diminished, not increased. The diminution of the sectional area of the bar is a very important feature, and strongly illustrative of the fact under consideration. If we take two bars of exactly the same length and sectional area, although the former dimension may be varied without any difference being occasioned in the result, and strain one of them first so as to elongate it to a certain extent, and consequently reduce its sectional area at the centre, and subsequently strain them both to the breaking point, the bar previously strained will bear the same weight as that unstrained, although the latter must have a greater sectional area, as it was not reduced like its fellow. Since the strength of any bar, rod, or other form of iron is directly in proportion to the amount of material it contains, that is, to its sectional area, the bar that underwent a preliminary straining, and had its area reduced, must evidently be the stronger, when it bore the same breaking weight that fractured another bar having more metal in it. Whatever has been previously mentioned respecting the "limit of elasticity" applies to bars under a tensile strain also, although the value of the limits in the two descriptions of strain are very different. These values vary considerably with the quality of iron employed, and to a much greater extent than the ultimate strength of the material, which depends a good deal also upon the perfection of the manufacture and the purity of the process.

From what has been remarked it would appear, therefore, that, previously to employing any iron bars, rods, pillars, or other forms, it would be advisable to subject them in the first instance to an initial strain, nearly equal in amount, and of the same description as that to which they would be in future submitted. That this plan might be open to objections there is little doubt, chiefly from the fear of overdoing the thing, and injuring the material by too severe a strain. There is also in addition the labour, expense, and loss of time that would be entailed in following out such a course. Imagine what it would cost in these three items, to submit every bar in the Charing-cross or Blackfriars Railway Bridge, to a preliminary strain. The end attained, would certainly not warrant the means to ensure it. At the same time, it is admitted that the tubular bridge over the Menai Straits would have undergone less deflection, had it been feasible to bring the top and bottom flanges into a state of heavy preliminary strain, before rivetting them up to the solid sides.

COMPETITIONS.

At the Darlington Board of Guardians' fortnightly meeting on Monday, the plans, of which there were eighteen or twenty, for a new Workhouse, were reported upon by the committee appointed for the purpose of selecting the best. The committee were assisted by Mr. William Lee, of London, and reported in favour of the plan marked "Nota Bene" for the premium prize of £40; the second, "Economist," was awarded the second place, £30; and the third, "Suum Cuique," £20. On opening the letters accompanying the plans, the premium prize was found to be Mr. Charles Adams, architect, Stockton; the second, Mr. George Slyan, of York; and the third, Mr. Robert Eland Dixon, architect, Darlington. The carrying out of the plan of Mr. Adams will entail a cost of £9,000. We believe this is the third important competition in which Mr. C. J. Adams has been lately successful, the two others being Hartlepool Town and the Middlesborough Exchange.

A meeting of subscribers to the Austin Memorial Workmen's Club and Institute, Madeley, Salop, took place on February 3rd, in the Infant's School Room, Madeley, for the purpose of selecting from the collection of designs and plans sent in for competition the one most suitable for the purpose. It may be remembered that in the particulars issued to architects it was specified, that the building should be of the red brick of the neighbourhood, with white stone dressings, and that it should contain the following accommodation, namely, workmen's common hall, or club room, youth's common hall, or club room, kitchen to supply refreshments, a smoking room, a reading room, committee and class rooms, a residence for hall-keeper, a large hall for concerts, lectures, &c., retiring rooms, lavatories, &c. These requirements appear to have been well kept in view by the competitors. The subscribers selected three designs, from the collection of upwards of fifty sent in, and submitted them to the decision of G. Maw, Esq., with a request that he would in the course of a fortnight select what he considered the best. The subscribers met on Wednesday last to receive Mr. Maw's report, and ascertained that he was in favour of the design bearing the motto, "Well Considered," by Mr. John Johnson, architect, of 35, Moorgate-street, London. The cost of the building will be about £1,400.

Is the Liverpool Corporation also going to do the unhandsome thing? It looks like it, we confess. For some reason which we are unable to explain, the architect who succeeded in obtaining the first premium of £3,000 in the recent Labourers' Dwellings Competition, has, we hear, been paid off and dismissed, and the plans of another competitor have been purchased for £100. Builders are now invited by advertisement to tender from these plans, without quantities or any assurance that any tender will be accepted, nor will any allowance, they are told, be made for tenders. As our readers are aware, these buildings have already been twice tendered for. What does all this mean?

THE POWER OF TRUTH.

ONCE more we have a word to say on the Pugin v. Barry controversy. If any of our readers should think this a profitless controversy, or that it is merely a personal squabble between Mr. E. W. Pugin and the Messrs. Barry, we beg to say, in vindication of our persistence in investigating the subject, that on its solution depends to a great extent the relative position of the man who supplies the ideas in art matters and the man who trades with them. A short time since a well-known architect said to us, "If you prove that Pugin was the principal designer of the Houses of Parliament, where will the matter end? We architects shall have others springing up in our offices and asserting claims prejudicial to our reputation and our interests." We said that if they can make good such claims, let them, in the name of justice, do so. We don't know why an architect should have the privilege of creating a reputation by virtue of designs furnished to him any more than an author should make a name by subsidizing another man to write his books.

It will be remembered that Mr. E. W. Pugin's pamphlet had a frontispiece consisting of a photograph of a "chateau," which was designed and drawn by A. W. Pugin in 1833. One could see at a glance that the character, spirit, and details of this design were similar to those of the Houses of Parliament. The two works bore the same unmistakeable stamp of individuality and resemblance, and one could scarcely resist coming to the conclusion that they sprang from the same origin. Dr. Barry, determined not to be outdone, imitated his opponent's plan, and gave as a frontispiece to his pamphlet a photograph of a drawing of the Throne in the House of Lords. Under the photograph it was stated, "This photograph is from Sir Charles Barry's drawing." The author goes on to say that the drawing is defaced and dirty, and that it had been difficult to obtain a clear photograph from it. This, undoubtedly, was the most remarkable point of evidence that had been submitted in Sir C. Barry's favour. Here is a drawing purporting to be in Sir C. Barry's hand, and it presents the selfsame characteristics as those which particularly distinguish the drawings of A. W. Pugin. Many said at once that, if Sir C. Barry could produce such a drawing, he had the ability to design the Houses of Parliament. But the idea naturally and spontaneously arose in thoughtful minds, how singular—in fact, how wonderful, that two men so essentially dissimilar in character and feeling, in education and purpose, should produce designs so similar and life-like. It was something like unearthing evidence to show that Cromwell had composed one of the books of "Paradise Lost." Here then, was a paradox—we may say, a contradiction. A week had scarcely passed away when new light began to break upon the matter. Mr. E. Pugin, in his answer to Dr. Barry, just published, says, "Of one thing I am certain, that the present structure (the throne) was entirely my father's design. I saw the various original sketches made, I saw them worked into shape, and Mr. Burton, to whom I have appealed, and who was then engaged by Mr. Hardman at Birmingham, distinctly remembers that the three designs of which I have spoken were taken to Birmingham, lost at the Railway Station, and subsequently found. He remembers my father's distress at the loss, carefully examined the drawings, and knows that they were his."

Mr. E. Pugin goes on to say—

> As regards the photograph itself, given in Dr. Barry's pamphlet, who will question my statement that Sir Charles copied my father's style, even to a dot? But for this evident imitation I should say that the photograph was not only after my father's design, but also drawn by his own hand—nay, I cannot admit even this qualification, for I boldly affirm that it is my father's own drawing or at least copied from one of his. In confirmation of this, I may refer to a series of drawings made by my father for the Earl of Dunraven, which in style and handling are a facsimile of that under consideration. Should the suspicions, not only of myself, but of all with whom I have come in contact, prove correct, without any wish to be offensive, I must say that it is the greatest piece of effrontery I ever met with.

Here, then, is an important revelation. Mr. E. Pugin speaks from positive knowledge, he calls a living witness, and he establishes a comparison between this drawing and a series made by his father for the Earl of Dunraven, which are a facsimile of the throne drawing. But to make the evidence complete and irresistibly conclusive, Mr. Herbert, R.A., whose reputation is European, and whose character for veracity is unimpeachable, says, in a letter that will be found in another column—"I was at the Grange when your father made the drawings for the throne. I was at work on the same board with your father when the post brought a packet from the then Mr. Barry. It was a drawing of the throne made by your father, treated as a pointed shrine, as if to enthrone Royalty." He goes on to say, "Why I so well remember this was that your father turned to me, and, with an unusual quiet sadness, said, 'He spoils everything I do.' These are the exact words, and I shall never forget them. He then went to the study place, and remarked 'Barry wants a *testa*.' Some days after this, he was engaged upon the throne by my side, and I saw him make the design exactly for the present throne." Without exaggeration, perhaps this is one of the most remarkable instances of complete change of evidence on record. The principal witness, Dr. Barry, the defendant, was called into court, and gives irrefutable evidence for the plaintiff. Of the completeness and conclusiveness of this there can be no doubt Augustus Pugin designed the throne, and Dr. Barry says that the drawing now in his possession is by his father's hand. Thus Sir C. Barry must have copied Pugin's designs, and palmed it on the world as his own. Posterity, which is no respecter of persons, and which looks at facts through the calm and severe atmosphere of justice, has a right to ask why the many hundreds of letters which passed from Pugin to Barry were disposed of, why the thousands of drawings furnished by Pugin to Barry were destroyed, and why almost every fragment of evidence which would throw light on the question has been removed? If the drawings were by Sir C. Barry's hands they would be treasured up as heirlooms for his children. But they don't exist. Something, however, does exist. The churches erected by Barry about the time he submitted the competition designs for the Houses of Parliament may be seen in London, and we have no hesitation in stating that they differ from the Houses of Parliament as much as chalk differs from cheese. They differ from the Houses of Parliament as much as a Greek lute differs from a cathedral organ. The evidences of Sir C. Barry's originating genius are indestructible. On the other hand may be seen evidences of Augustus Pugin's inventive ability in innumerable drawings, in furniture, in churches, in halls. "The man," says Mr. Gladstone, when looking at the tower of Scarisbrick Hall, "who designed this tower in all probability designed the clock-tower of the Houses of Parliament, only the Scarisbrick Tower is a more beautiful and living work." Between the Houses of Parliament and the works of Sir C. Barry there is an irreconcileable antagonism. Between the Houses of Parliament and the other works of Augustus Pugin there is a unique and indisputable relationship. Both the internal evidence and the external records tend to the same point—namely, that Augustus Pugin's hand was the main instrument in producing the Houses of Parliament. We have not spoken so positively before, but the accumulation of facts is so rapid and certain that we are compelled to give no uncertain sound in the matter. Another question will by-and-bye come up, and that will be, not about the authorship of the designs for the Houses of Parliament, but about the honesty and righteousness of Sir C. Barry's conduct. We are well aware that, even in hinting such a thing, we shall evoke a sneer from the superficial, and call down a frown from the powerful. But, as we have no prejudice to preserve, no friendship to vindicate, and no personal object to promote, we shall feel secure in our desire and our intention to defend the right. There is one thing which presses itself on our attention in this controversy, and that is that truth is by far the mightiest weapon in this world. The more a true statement is investigated the more it makes itself manifest. Everything appears to conspire in its favour. The strong may league themselves together to put it down, but they may as well try to quench the sunlight. Blundering journalists may do their best to hide it with a cloud of words, but the cloud will pass away sooner or later, and the true statement will remain. Prejudice may unwittingly misrepresent, and partizanship may diminish or magnify, but that which is in its very nature true—knows nothing of passion or of party, will survive. It makes not a particle of difference to us personally who was the art architect of the Houses of Parliament. If we thought, by virtue of the evidence presented to us, that Sir C. Barry was the man, we would do our best to beat Mr. Edward Pugin's pretensions into the dust, and range ourselves by the side of the Barrys in their righteous endeavours to vindicate their father's name. But after an impartial investigation of the evidence, we can, in obedience to the inexorable claims of truth, do no other than assert our opinion that Augustus Pugin's brain conceived and his hand executed the principal drawings for the Houses of Parliament, and, though he, during his eventful and stormtossed life, was satisfied to be unrecognized and comparatively unrewarded, posterity, the arbiter of individual fames, will assuredly do him full justice.

COCOA NUT FIBRE.

WE last week alluded to the uninflammability of cocoa nut matting, and we will now lay a few facts before our readers in relation to the extensive use of cocoa nut fibre. This substance, now so familiar to British eyes, has only been applied to industrial purposes in this country about a quarter of a century. It was first introduced into England by the late Captain Wildey. Mr. Treloar, the well-known manufacturer of Ludgate-hill, became his partner, and to him right fairly belongs the chief merit of developing the use and application of the material. A new industry, in fact, has been introduced into the country through its instrumentality, as may be seen from the following, among other purposes, to which it is applied:—It is used for stuffing mattresses and sofas, and, in fact, for all purposes to which curled horsehair is applicable. In another column will be found a letter showing that it is peculiarly adapted for this purpose on account of its coolness, cleansibility, and uninflammability. It is used for making brushes and brooms, and for all purposes to which bristles are applied. It is used in the manufacture of cables and cordages of all sizes, and lines for fish nets, being, like gutta percha, singularly durable—in fact, almost indestructible—when submerged in salt water. It is made into sheep-folding nets, into yarn for thatching, for tieing up trees, and other agricultural uses, as it bears exposure to the weather for a long time without damage. It is used for making cloths for oil pressing, stearine candle pressing, cider pressing, &c.; for ships' fenders or buffers, for floor matting, and for door and carriage mats in endless variety. It is manufactured into nosebags for horses, into hassocks and kneelers for church use. When we come to inquire into the matter, it is surprising how diversified are its applications and how extensively it has been subordinated to human use. Even the

very best or refuse from the manufacture of [illegible] is a valuable material to mix with the soil of strawberry beds, to fill trenches in which cuttings are to be planted, and other horticultural uses, because it possesses the property of being always moist but never wet, and continues in the same state without rotting, and no insect will harbour in it. We have been induced to inquire into the nature of this material, and to record some of its valuable uses, because Mr. Morton, a [illegible] when speaking in the public papers of the cause of the fire at the Oxford Music Hall, made the singular mistake of stating that cocoa-nut fibre is flammable. We can speak from experience and demonstration that it is not so. It possesses peculiar capabilities, and is the basis of a great and a growing industry. A Liverpool magistrate a short time since said that petroleum was a gift of Providence, but that its use was accompanied with great danger. We regard cocoa-nut fibre as a gift of Providence unaccompanied by danger in its use, and therefore an unmixed blessing to man. The bulk of the raw material is imported from Ceylon, a little from the West Indies, and some from Singapore. Its total annual value when in the raw state, before being manufactured in this country, is about £[illegible]; and the number of persons employed in its manufacture is estimated at about 3,000, besides a still larger number of prisoners who are constantly occupied in making the commoner kind of mats in our prisons.

THE ARCHITECTURAL EXHIBITION.

ONCE more as the spring time comes round we beg to call attention to the Architectural Exhibition. All who have anything worth sending, let them prepare for sending it. For years past this exhibition has not been what it ought to be, and what it might, by an organized effort, be easily made. Many of our chief architects stand aloof. They are too indifferent about the matter. Better, we say, to have no exhibition at all, than to have one that misrepresents the ability of the profession. There was an evident step in advance, as far as classification was concerned, in the exhibition last year. But there were many drawings hung that ought not to have seen the light at Conduit-street. It is far better to have a dozen good subjects than twelve dozen bad ones. If the committee will have the courage to exclude all unworthy drawings or designs they will raise the character of the exhibition. But then, it may be said, "what can be done with the space? it would never do to have bare walls." Our reply is, "Why confine yourselves to architectural drawings? why not admit art furniture? why not admit art manufactures?" We see no reason why an architectural exhibition might not include specimens of wood and stone carving. We hear that designs for fresco painting and mosaic decorations are expected. The council also expect a collection of valuable drawings of architectural works by foreign architects. This will undoubtedly prove a source of attraction to many. The council are prepared, as they were last year, to receive a limited number of paintings and drawings of an architectural character for sale. They have made arrangements with Messrs. Cundall and Fleming, whereby members of the society may have their works photographed at considerably less cost than that usually charged for such works. We are sorry to find that there are to be no lectures this season, because the lectures of last year, "although given conjointly with the Architectural Museum were not sufficiently well attended to warrant their continuance." Architects and others are reminded that drawings, models, &c., for the forthcoming exhibition must be sent to Conduit-street, on Wednesday or Thursday, the 8th and 9th days of April next, after which no drawings can be accepted.

ON PATENTS FOR INVENTIONS.

WHATEVER facetious writers may say about the dry-as-dust, intensely matter-of-fact, and eminently unromantic character of Blue Books, their value and utility as public records are beyond dispute. We have before us a batch of these publications of an unusually interesting kind, which have just been printed by order of the Commissioners of Patents, under the supervision of Mr. Bennett Woodcroft, the indefatigable Clerk of the Commissioners. The volumes consist of abridgments of specifications relating to the various patents for inventions deposited in the Patent Office. It is explained, in the brief preface which introduces each Blue Book, that the indexes to patents are now so numerous and costly as to be placed beyond the reach of a large number of inventors and others, to whom they have become indispensable. To obviate this difficulty, short abstracts or abridgments of the specifications of patents under each head of invention have been prepared for publication separately. These are so arranged as to form at once a chronological, subject matter, reference, and alphabetical index—a fourfold index, in fact, to the class to which they relate. Our readers may form some notion of the multifarious nature of the contents of the Patent Office, from the fact that the number of specifications printed and published up to this time amounts to 61,000. These volumes, therefore, cannot but prove of the greatest service to scientific men, for only by their assistance can they get any true idea of what has been done, and is continually being done, in the fertile field of invention. To each book is given an introductory chapter on the general subject treated—a sort of historical sketch or *resumé* of the main contents. One of the books, we find, is devoted to mechanical contrivances for raising, lowering, and weighing heavy bodies, more particularly those appliances invented since the year 1617. This is prefaced by a very interesting account of the machines or improvements employed for such purposes in the very earliest times, so far as they are known to us. Our information on this point, however, is extremely limited. It has always been a subject of speculation and wonder as to how the Egyptians and other nations of antiquity were enabled to raise the enormous masses of material which they used in the erection of their temples and monuments. Our oldest books, as Mr. Woodcroft remarks, give us no information, nor do the paintings and sculptures of antiquity—in many respects so illustrative of art and science, as understood and practised at the periods at which they were executed—show anything calculated to give us a correct idea of the means employed by the architects and mechanics of those periods in raising and lowering heavy bodies. The only illustration found in the sculptures of Egypt which is worthy of notice, represents a mode of raising water by means of a bucket suspended from one end of a pole, which is mounted horizontally upon a fulcrum, so as to serve as a lever; the other end being raised and lowered alternately by hand, so as to cause the end carrying the bucket to alternately lower the bucket into, and raise it from, the water. This "dodge," it is hardly necessary to remark, is in use at the present day. That the Egyptians were also familiar with the rope and pulley, the discovery of these articles some years ago proves. It is, indeed, believed by many that they were in possession of all those contrivances for raising and lowering which were certainly known to the Greeks and Romans. The use of the inclined plane, the pulley, and the screw was clearly enough understood by Archimedes, as appears from his writings, though we may well doubt some of the extraordinary mechanical feats with which the father of the science is credited, as when the safety of his native Syracuse was in danger from the Roman fleet. In the works of Vitruvius, again, we have the antiquity of the capstan, the crane, and the windlass clearly established. The balance beam and scales were likewise known to the ancients. We have the first mention of the former in the Book of Genesis; and in one of the sculptures found at Thebes there is the representation of a pair of scales, of which "the beam is suspended by rings from a short arm projecting from an upright pillar, the scale being connected to the beam by three cords and a pointer projecting downwards from the centre of the beam, by which, in conjunction with a plumb line, it can be seen that the scales are evenly balanced." Some years ago a steelyard was found in the ruins of Pompeii, which was provided with the points of suspension, as may frequently be seen at present. The important addition to the windlass of the "pauls," for preventing the barrel from running backwards in case of the weight being raised proving too great for the strength of the men employed, appears to have been made about a century ago, but by whom, or the precise date of the invention, is uncertain. The supposition seems a natural one, that previous to the great invention of printing many inventions were lost to the world for want of some more efficient means of preserving them than was then available. It may be that we are so much the poorer in consequence, though it is doubtful whether the inventive faculty was as active and strong among former generations of Englishmen as it has shown itself in these latter days. A bare list of the names alone of contrivances belonging to the class of inventions we are considering, which have made their appearance during the last two centuries, fills an index of several pages. They include hydraulic and pneumatic pressure, the buoyancy of balloons in the air and of pontoons under water, with almost endless combinations of levers, wheels, racks, screws, and pulleys, as well as a host of machines for weighing ponderous articles, such as steam boilers, locomotive engines, and other structures unknown to our forefathers, and of which they had no conception. Another of these issues is devoted to railways, and improvements relating thereto, from the year 1770 to 1865, a third to hydraulics, and a fourth to the preparation and combustion of fuel, on all of which subjects these Blue Books afford a ready and valuable reference.

CHURCH OF ST. PORCLAIRE, POITIERS.

WE give this week an illustration of the fine old Romanesque Tower of this church. It will be remembered that some time since we illustrated the church of St. Radiugode in the same remarkably interestiog town. Upon comparing the two towers the details will show how closely in date they must have been erected. We extract the following from Mr. Inkersley's "Inquiry into the Chronological Succession of Styles of Romanesque and Poiated Architecture in France," as giving good evidence as to the date of the tower of St. Porclaire. "We first find mention of the Monastery of St. Porclaire in a chart of the year 1068, and, though this document furnishes no direct proof of the epoch of the construction of the church. the close analogy to other Romanesque edifices of the province approachiog this date displayed in the tower and doorway beneath, which still exists, affords good grounds for believiog that these portions were not replaced at a more modern period." Poitiers is very rich in Romaoesque architecture, and there are some remains of domestic work of an early period well worth study; in fact, it is a place full of iostruction to architects as well as antiquaries. Our illustration is from a sketch by Mr. Fred. W. Roper, architect.

What has been very often recommended in our pages has been done at last; the Mansion House has been washed down, and now the group of the Mansion House, the Bank, and the Royal Exchange, look as fair as if in Paris.

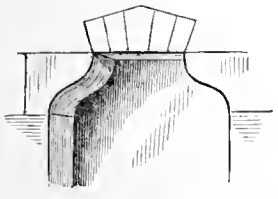
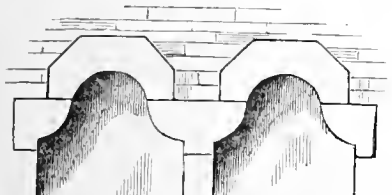
CONSTRUCTIVE AND ÆSTHETIC DESIGN.—No. XII.

THE constructive and decorative capacity of the arch, and its applicability to both Classic and Gothic design, we have already glanced at. Window and door heads, as essential and prominent features of our architecture, have, in the diversity of treatment they have lately received, sufficient interest for us to devote some further remarks to them. I have shown that the square-headed, no less than the circular and pointed forms of the arch, can be constructively used, and are adaptable under a variety of forms—square, trefoil-headed, cant-headed, &c. One or two varieties of great simplicity, and well adapted to our modern sash and casement lights, are subjoined. These forms are always preferable in use and economy, and are pleasing in their effect, either when separately adapted or enclosed under an external arch, which latter can be frequently carried up to any height over the ceiling levels, thereby insuring strength, relief, and boldness of elevation. The enclosed heads, or tympana, thus formed can be relieved by carving, foliations, or simple piercings—figs. 4 and 5. The upper angles of square-headed openings can be varied by hollows or ogees, strength and effect being thus combined. Classic and Gothic, or at



least our modern adaptation of them, have so interchanged their distinctive peculiarities, that flat-headed openings are no longer the exclusive property of either style; and the



architect has simply to consult his taste and judgment in making the prevailing lines of his structure harmonize or contrast with the outline of these features. It is, however, of the constructive adaptability of these forms, rather than of their æsthetic effect, we here speak, and every practical designer will, by a preference bought by experience, select the most rational features for his work.

DETAILS OF GENERAL CREDIT AND DISCOUNT OFFICES.

HAVING on two preceding occasions given illustrations of the General Credit and Discount Company's offices, Lothbury, we this week give drawings of the principal doorway and of the board-room window. The shafts of the doorway are of serpentine marble, and the doors are in wainscot. The voussoirs of arch are alternately in red Mansfield and Portland stone. The carving was executed by Mr. L. T. Carter. The architect, as before stated, was Mr. Somers Clarke.

PUBLIC STATUES IN LONDON.

MR. FRANCIS TURNER PALGRAVE, a cleverly-pleasant writer, though an art critic of strong prejudices and somewhat oracular utterances, contributes to the current number of the "Broadway," the first instalment of a notice of the public statues in London. The critic sets out by remarking, that monumental statues, common enough in Ancient Egypt, Greece, and Italy, were hardly known during the Gothic or Mediæval period of Western Europe. They first appear in England in connection with the Lord Arundel who collected antique marbles. It was he who caused the bronze equestrian group of Charles I. at Charing-cross to be modelled, in 1633, by Hubert Le Sueur, who is called a pupil of the Italian sculptor, John of Bologna. Placed well for effect, Mr. Palgrave considers this statue "too high for convenient study as a work of art—it appears to be in a tame, at least a timid, style, which hardly rises above the common monumental sculpture of that day; and, in the age of Vandyck, one would have expected a more picturesque and effective likeness, especially since, when seen in front, one traces a distinct reference to that great painter's equestrian portraits. The horse is fairly natural, though not free from indications that the artist was thinking of the ill-modelled breed of the ancient Roman sculptors; and the best thing we can say of the group, is that it avoids the bad extravagant style which had by 1633 corrupted Italian sculpture, and of which John of Bologna was one of the most brilliant representatives.

Strange as it may seem, London contains at least one public statue the subject of which is hardly less uncertain than if it had been dug up in Greece or Italy. Probably during the reign of Charles II., when Soho-square was begun, a stone figure was placed there, which has been assigned to the unhappy Duke of Monmouth, to James II., and to Charles himself. The last appears the most probable. It is a standing figure, clothed in English armour, but with a robe twisted behind; a wig surrounds the mutilated features. Cromwell still waits for his statue; and he, in truth, should be a very powerful and accomplished sculptor whose hands could safely attempt the difficult task of doing justice to the great man who stands up like some huge rock among the petty figures of the Stuarts. But unless we commemorate a prince or a general (and Cromwell was something more than most princes and generals), English funds are rarely forthcoming. Men even greater than the Protector are equally unrepresented. Yet there are few methods by which a wealthy man might more certainly or more honourably hand his name down to future generations than by a first-rate public monument to departed genius.

James II., by Gibbons, the woodcarver, apparently completed in 1687, stands behind Whitehall, and, considering its age and exposed position, is well preserved. He is in full Roman armour, laurel-crowned, and a robe falling behind him; the attitude, that of a man giving some command, is rather too showy, yet is rendered with ease and a certain dignity, and there is a considerable air of likeness in the harsh but narrow-looking features. The modelling is fair in its conventional way, which reminds one rather of the Roman-antique style than of nature; and it deserves special praise that Gibbons has known how to take advantage of his material, and has given his figure the comparatively disengaged or "open" attitude of which bronze, from its superior tenacity, admits. The drapery, from the same reason, has been kept light and flat in the folds. These may seem obvious merits; but it will be found that sculptors of much greater pretension and experience than Gibbons have not felt the difference between working in stone and working in metal, and have made their bronze figures dark and heavy, by a massive treatment which only looks well in its own appropriate and light-coloured material. The artist received £500 for this work—a very large sum, the time and the size of the figure considered, and a proof that he must have obtained fashionable recognition as a sculptor.

William has but one statue—that in the centre of St. James's-square. So far as its distance from the eye admits of a judgment, this group (it is equestrian), though rather clever and lively, appears to be in a poor style, imitating the French statues of Louis XIV., and has all the look of a contemporary production. Yet it seems certain that the younger Bacon not only placed this figure here in 1808, but modelled it. Though wanting in dignity and grace, this group has some truth to character in its expression of will and energy. The curious way in which the hair of the tail is detached in little masses in the direction of the horse's progress was probably intended to increase this effect. But there is always a want of due stability and repose when a figure appears to be rapidly moving off its pedestal. The pause of arrested motion, the moment of suspended action, by the laws of material, is almost always the right instant for sculpture to express.

Anne figures thrice: before St. Paul's, and in the two Queen-squares named after her. Of these statues it will be enough to describe one. That in Queen-square West (apparently Portland stone painted) represents her exactly as she might have looked in one of the pictures of the time, in full court robes, wearing a crown, and rising up or walking forward; whilst the right hand is extended over a cushion resting on a twisted column. The features are pleasing, and though

the work is without any trace of proper style, the figure has a ladylike and dignified air. The broken sceptre now lies upon the cushion—an emblem of her ill-fated family! The quiet square, with its solemn but not ungraceful houses around, some still preserving fragments of contemporary carving, the trees and the untrodden grass plots, is a fit place for the monument of the last reigning Stuart.

A figure of George I., showy but effective, and infinitely better designed for its position than the York and the Nelson columns, by two once fashionable [illegible], with into the picturesque campanile of St. George's, Bloomsbury.* George II. (or George I.,—the point is disputed), in Leicester-square has been lately mutilated and ordered for removal, equal acts of folly, for, though the statue was, perhaps, not of greater merit in art than several of our most recent figures presently to be noticed, yet it had real interest for all who feel that to love their land is to love its history, and are aware how much a past period is vivified and realized by the sight of any actual monument which the men of that day saw and handled. A second statue of George II., perhaps by the same hand as the one of his father, stands, like a Roman warrior, in Golden-square. This, again, is a stone figure painted over with the exquisitely absurd English taste in these matters, to look, no doubt, more like stone! The statue is of the ordinary monumental sort, though very elaborately wrought in the drapery and armour, which, from unskilful arrangement, gives it a clumsy air.

The Duke of Cumberland, an equestrian bronze set up in 1777 within Cavendish-square, is the last and perhaps the worst public statue in the primitive style which need be mentioned, for a standing figure of Sir H. Sloane, by Rysbrack, in the Apothecaries' Gardens at Chelsea, though noteworthy as the first extant memorial to a private citizen of distinction, hardly falls within our subject. Awkwardly huddled together in his robes, and seemingly desirous to ride off and hide himself, the statue of the Duke almost justifies a criticism which it drew from Sir J. Reynolds—that modern dress was radically unsuitable for sculpture. But no powerful sculptors had proved then, as David d'Angers in France, Rietschel in Germany, and Watson and Wolner with us, have since proved, that the reverse of Sir Joshua's verdict is the truth. Indeed, it is obvious to common sense that, if we cannot clothe our contemporaries as they were really clothed, we had better leave monumental sculpture alone.

These figures, remarks Mr. Palgrave, all date before sculpture was studied as an art in England—nay, before it was thought possible that genuine English hands could produce anything worthy to be called sculpture. After observing that, during the first half of the last century, nearly the same scepticism existed also in regard to our capacity for painting until Hogarth's time, and the appearance of Reynolds, Gainsborough, and Wilson, Mr. Palgrave says it is about a century since the efforts of Nollekens, Banks, and others, began to lift sculpture above the church figure fashion, or the mere imitation of French and Roman models, and there is henceforward some attempt at sculptural style, although often imperfectly carried out, in the public statues of London.

THEORY OF COLOUR.

ON Saturday evening last, Mr. W. Cave Thomas gave a lecture on "Some Thoughts and Experiments in Reference to a Theory of Colour," to the members of the Associated Arts, Richard Westmeath, Esq., R.A., in the chair. The lecturer said it was to be regretted that the three phases of the theory of light—the physical, the physiological, and the æsthetic—were too frequently separated and studied as distinct specialities; it is therefore seldom grasped in its totality and pushed to its legitimate and ultimate conclusions. He then gave a short history, derived from the best authorities, of the two great theories—the corpuscular and undulatory—which so long divided the scientific world, and traced the progress of the growing conviction of the ultimate coincidence of light and sound in one common phenomenon—the vibrating movement of an elastic medium. He then drew attention to the more recent and sweeping generalization—the correlation of the physical forces, which considers light, heat, sound, electricity, &c., to be merely modifications of an active substance—that everything objectively varies only in configuration and mode and degree of motion; but produces, phenomenally or subjectively, all that infinite variety over and above those differences which is commonly but erroneously supposed to exist externally and independently of sense, whereas, independently of sensuate being, there is nothing but a colourless, silent, fluctuating universe. It is somewhat difficult to conceive this condition of the external world without some previous habit of abstract thinking. Nevertheless, it is a conception which both the Newtonian and Huygenian theories favour; for the former ascribes the differences in colour to the differences in the velocities of the atoms emanating from the sun, and not to differences inherent in the particles themselves; for, if this were the case, colour would be independent of differences of velocity and refraction: and the latter, or undulatory theory, attributes light and colour to undulations of an elastic medium of different rapidity and magnitudes just as the different notes of music are produced in the ear by relative differences in the pulsations of the air. That which through the medium of our senses is actually perceived by the sensorium, is indeed merely a property, as change of condition of our nerves; but the imagination and reason are ready to interpret those changes produced by external influences, as properties of the external bodies themselves, and it is only by close reflection that we perceive this notion to be erroneous, and that there is neither light nor colour in the world to other than living eyes, and no safe progress can be made in scientific studies till this position be thoroughly comprehended.

The first great deduction to be drawn from the theories just noticed is, that light and colour are in all of them attributed effects of moving matter acting on the retina. If, therefore, this physical hypothesis be correct, it might be *a priori* surmised that, as one simple physical cause produces all those diverse effects on the retina from without, the same simple cause would produce similar effects acting from within, and such is the fact—the accumulation of blood in the capillary vessels of the nerves, as in congestion and inflammation, is the one uniform cause, exciting in the retina, while the eyes are closed, the sensations of light and luminous flashes, and in the auditory nerve, humming and ringing sounds. The mechanical influence of a blow, concussion, or pressure, also excites in the eye the sensation of light and colours, and in the auditory nerve the sense of ringing. Voltaic and frictional electricity, and chemical agents, such as narcotics, also produce the different sensations proper to the two senses. Here, then, is another class of facts pointing to force as the common cause of light and sound. Mr. Thomas then passed to the consideration of the phenomena of ocular spectra, and showed that these were yet another proof that colours have their immediate cause in the condition of the retina itself; one very notable experiment illustrating this were the slips of card of one uniform grey tint, which were made to assume all the hues of the spectrum by being placed in the midst of various fields of bright colour, and it was readily proved that these hues had no external existence. In these phenomena, too, the lecturer drew attention to the presiding principle of compensation or balance, and to this being the key to all harmony, and went on to say that it would be noticed in the facts brought together that light and sound may be produced by mechanical means—by a blow, by pressure, by the arterial pulse, by electricity, and by narcotics; that the remarkable phenomenon of interference by which two rays (of either light or sound) extinguish each other, is common to both; and that the theory of light which has the widest acceptance is that which makes its propagation analogous to that of sound. Every colour, therefore, as every musical note, will, in this case, depend upon the relativity of the vibrations of an elastic medium acting upon the retina. But the very fact of the complementary colours, or of compensation in the ocular spectra, connected them with the larger physical phenomena of the solar system, in which the great law of compensation is immutable. It may be thus stated: every departure from a mean state on one side must be compensated by an equal but opposite aberration on the other,—this law, he believes, will eventually lead to the clearing up of much which is still obscure in the theory of colours. But whether we consider the theory of light in its physical aspect as the relativity of vibrations and of states of the retina, as produced by mechanical pressure, or in the phenomena of compensation, its wonderful parallelism with that of sound becomes more and more apparent, and that, like music, it ultimately merges in a science of relative proportion. Mr Thomas concluded an exceedingly able and interesting lecture by observing that science often speaks too confidently about force, as if she had the power to recognize cause *per se*, when she has but the means to infer; that all the time she fancies herself occupied in studying the external, she is only contemplating the world in sense, in its appearances to human nature; and that the fundamental form of sense is quantity. The science of proportion, therefore, is the master one which underlies all others. Of this science Mr. Thomas has given an outline in his work, "The Science of Moderation." When all our knowledge shall have assumed the form of correct quantitative statement, it will have attained its highest degree of certitude.

VENTILATION FOR THEATRES.

M. HAMELINCOURT, of Paris, in his design for the ventilation of the new Grand Opera there, provides for separate systems of ventilation in the summer and winter; in the one case admitting the external air direct, in the other heated. In both cases the fresh air is procured from an opening at the roof to ensure greater purity, and enters the house between each tier of boxes. The foul air is drawn downwards through openings in the floor, thence through flues which pass outwards to the walls, where they ascend, again converging to a common central shaft over the dome of the house, which has an outlet for the vitiated air under the cupola. The draught in this great central shaft is promoted by the ascent of the heated air nearest the ceiling of the house, which has access to it through perforations. Thus it will be seen that the air is renewed by entering in a horizontal direction in the sides of the house, and going out at the top and bottom, the movement of the air in the pipes, which draw it down through the floor, being created by artificial heating. The success of such a system will depend on the complete but imperceptible changing of the air to meet fully the requirements of the largest audience. It is imperative that the air drawn out by the floor should not contain the products of the combustion of the gas used in lighting the house. A gold medal has been awarded to M. Hamelincourt for his apparatus.

AN EARLY ECCLESIASTICAL FRAGMENT.

AT a recent meeting of the Society of Antiquaries of Scotland, Lord Neaves, one of the Vice-Presidents, in the chair, an interesting paper on "the Priory of Restennet, in Angus," was communicated by the Bishop of Brechin. The portions of the priory which still remain consist of the chancel and the tower, with the walls of the cloister. The chancel is a fine specimen of Early English, but the most interesting feature is the tower, which the Bishop considers to be of the period of St. Rule's Tower at St. Andrews, with some features of rudeness identical with those found in the admittedly Saxon tower of St. Michael's at Oxford. In this tower at Restennet, the Bishop noticed for the first time a rude arch of a different material from the rest of the fabric, and so massive and rude in its construction that it must have belonged to an earlier church. The photographs of both the exterior and interior aspects of this arch were sent, from which it appeared that on the outside a rude moulding might be distinctly traced; while the interior view gave very distinctly the composition of the rude work, where a massive lintel, hollowed out as a round arch, and hewn out of one stone, is superimposed upon the posts on either side, thus forming a doorway. It appeared that this doorway had been imbedded in the masonry of the tower from the beginning, and built up, so that it never had been used as an actual entrance since the erection of the tower. Another account of the priory was read by Mr John Stuart, the secretary of the Society. This gentleman was of opinion that the doorway and arch described by the Bishop had also formed part of an early tower, and that it had been built into the enlarged tower of the eleventh century, probably under the influence of David I. or his father Malcolm, by both of whom charters were granted to the priory, and who were both church builders and restorers. Mr. Stuart entered into a consideration of the Scotican mode

* [illegible] ... "A Masterpiece of Absurdity."

of building, which was the only one known to Nectan (King of the Picts, 710), he then directed attention to the recent introduction into Northumbria of the Roman mode of building, which implied the chiselling of stones and the use of mortar. Of Benedict Biscops Church at the mouth of the Wear, the only part now remaining is a tower, penetrated by two arches of small dimensions. Taking all the circumstances into account Mr. Stuart was led to believe that in the rude arch imbedded in the eleventh century tower there was preserved a fragment of the eighth century church built for King Nectan by the workmen sent from Jarrow, if indeed we are not to recognize these workmen in Bonifacius and his companions. In this case, it must be considered the earliest ecclesiastical fragment now left to us; for while, in various features, it greatly resembles the doorways of many of the round towers and early churches of Ireland described by Dr. Petrie, which might be of an almost contemporary period, and while in the round towers of Brechin and Abernethy the arches of the doorways were cut out of the solid stone, as at Restennet, yet it was with a skill and finish which marked them as of a later date.

BIRMINGHAM ARCHITECTURAL SOCIETY.

AT a meeting of the Architectural Society, on Thursday evening last week, Mr. George B. Nichols, of West Bromwich, read a paper as an introduction to a more detailed discourse to be delivered on a future day before the same society, on "The Adaptability of our own Home-grown Timber for internal purposes." Mr. Nichols said the subject had been forgotten by the profession for the last half century at least. The timbers of foreign countries having been brought rapidly into use on account of their adaptability and cheapness, the country had been led to depend entirely upon them, and home-grown timber had been allowed to degenerate, and become of no use except for inferior purposes. The beauty and adaptability for internal purposes of many of our home-grown timbers had been overlooked. He laid before the society samples of home-grown timber, "with a view to the introduction of a variety in design for internal work, when occasion may offer for an improvement upon the ever monotonous painting and graining." The samples he wished to bring under notice, included "the vine prop alone;" "the poplar, never dry," "the builder oak, sole king of forests all;" "the willow, worn of forlorn paramours;" "the yew, obedient to the bender's will;" "the birch, for shafts;" "the warlike beech;" "the ash, for nothing ill;" the maple, the larch, the Scotch fir, the lime tree, the wych elm, the sycamore, the cherry tree, the alder, the howler, the hornbeam, the apple tree, the plum tree, the walnut, and the chestnut. He hoped the subject of internal decoration would be considered, with a view of bringing out in their natural state the materials to be dealt with, relying on the beauty of nature for effect, wherever it could be obtained by judicious treatment of form and colour. He presented the samples to the society for the museum.

LONDON WATER COMPANIES.

IN his recently published returns, the Registrar-General discusses Professor Frankland's report on the drinking water supplied to the metropolis in the past year. In connection with the opinions now generally entertained with regard to the propagation of certain forms of disease, such as cholera and typhoid fever, by means of spires or germs contained in excrementitious matter, he states that the search for sewage pollution in the metropolitan waters has now assumed a high degree of importance. In 1867 the total solid impurity exhibited an increase over 1866 in the water supplied by the different companies, except in the case of the East London Company, in which a marked decrease had occurred. This water, it is stated, was now only inferior to that distributed by the New River Company, which stood alone in the perfection of its filtering apparatus. On one occasion only had the New River water exhibited the slightest turbidity, thus proving that perfect filtration was compatible with a large supply. The other companies occasionally or habitually sent out water that was turbid, and subjected the inhabitants of more than 300,000 houses to the unnecessary expense of private filtration. The Registrar-General calls attention to the fact that, in a sanitary point of view, the tendency of rapidly increasing populations within fixed boundaries was to deterioration. The rate of mortality, uncontrolled, was sure to rise; and if there was reasonable ground to believe that the great engineering works which had been undertaken in connection with the public health had checked this tendency, and to some extent subdued the virulence of epidemic diseases, such results must be regarded with satisfaction and hope. On the whole, the metropolis, as compared with the principal towns in the kingdom, continued to maintain its favourable position in the hygienic scale.

JET.

JET, like amber, is a substance concerning the origin of which more than one conjecture has been hazarded. Some writers confidently describe it as a species of coal; others, as fossil wood, and one ascribes its origin to the action of petroleum. It is found in Saxony and in the Prussian amber mines, and in this country in the upper lias shale in the vicinity of Whitby, and has been worked there for many hundred years. The best is obtained from a lower bed of the upper lias formation, which is of an average thickness of about 20ft., and is known as jet rock. "Soft jet," obtained from the upper bed of the lias, and from the sandstone above it, is an inferior kind. Both are found spread out between the laminations of the rock, in layers seldom more than 1in. or 2in. in thickness. Jet ornaments were made in England during the occupation of the Romans; and in mediæval times, when Whitby Abbey was a centre of religious life, jet rosaries and crosses were worn by the nuns. On the advent of Protestantism, however, at the commencement of the reign of Elizabeth, the manufacture ceased, and appears to have fallen into desuetude until the year 1800, when two working men commenced to make bead crosses and neckchains with files and knives. A stranger who visited Whitby noticed their rude attempts, and advised them to try and turn the material. They followed his advice with complete success, were joined speedily by several others, and since then the trade has steadily increased. The best ornaments are sent to London, the inferior ones being designed for the American market.

VARNISHES.

VERY superior varnishes are made with a solvent composed of highly rectified alcohol and benzole, instead of using, in the common way, alcohol alone. The alcohol should be nearly pure, and equal portions of it and the benzole mixed together and distilled with 7oz. of caustic lime to each gallon. The gum resins should be reduced to as small pieces as possible before being fed into the solvent. The following are different varnishes made with gum resins and alcohol—benzole solvent:—1. For carriage varnish—copal, 23oz.; amber, 8oz.; anime, 4oz.; camphor, ½oz.; solvent, 1 gallon. 2. Varnish for external use—copal, 28oz.; amber, 4oz.; anime, 4oz.; camphor, ½oz.; solvent, 1 gallon. 3. Furniture varnish—copal, 24oz.; shellac (bleached), 8oz.; olibanum, 4oz.; camphor, ½oz.; solvent, 1 gallon. 4. Picture varnish—copal, 20oz.; damer, 12oz.; mastic, 8oz.; solvent, 1 gallon. 5. White hard varnish—copal, 8oz.; mastic, 16oz.; sandarac; 4oz; camphor, ½oz.; solvent, 1 gallon. 6. French polish—shellac, 32oz.; solvent, 1 gallon. 7. Another French polish—shellac, 32oz.; olibanum, 4oz.; solvent, 1 gallon. 8. Varnish for prints and maps—mastic, 16oz.; sandarac, 16oz.; Canada balsam, 4oz.; solvent, 1 gallon. 9. Varnish for iron (to be applied hot)—resin, 12oz.; sandarac, 16oz.; seed lac, 6oz.; solvent, 1 gallon. Preparations of lacquer—1. Sandarac, 26oz.; shellac, 6oz.; turmeric, 6oz.; gamboge, 1oz.; solvent, 1 gallon. 2. Seed lac, 18oz.; amber (fused), 6oz.; gamboge, ½oz.; dragon's blood, 1oz.; saffron, ½oz.; solvent, 1 gallon. 3. Seed lac, 8oz.; copal, 4oz.; sandarac, 12oz.; turmeric, 2oz.; aloes, 1oz.; gamboge, 1oz.; dragon's blood, ½oz.; solvent, 1 gallon.

LEEDS DRAINAGE SCHEME.

MR. ALFRED M. FOWLER, the surveyor to the Borough of Leeds, has submitted a report on the formation of a drainage district for the south-west portion of the borough, which has been published. The proposed new district includes the townships of Armley, Upper and Lower Watley, Farnley, Hough End, Upper Moor Side, Beeston, Mill Shaw, Waterslacks, with such portions of Stanningley and Pudsey as are in the borough. The whole of the district, with the exception of 604 acres at Armley, which drains naturally into the river Aire, and 524 acres near Beeston, which drain naturally into Middleton Beck, is in the valley of the Holbeck. Five main sewers and a number of minor ones draining into them will be required, embracing a total area of 5,764 acres, containing a population of 26,800. Of this about 561 acres are covered with buildings. The sewers are not intended to carry the floods of the district, and a number of storm outlets are provided for the purpose of relieving the sewers in times of heavy rain. The total estimated cost of the project is £40,500. This amount, however, does not include any provision for ventilation, that subject being at present under the consideration of a sub-committee. The cost of maintaining the works in an efficient condition is calculated to amount to about £200 per annum.

NOTICES OF PUBLICATIONS.

"A Century of Birmingham Life; or, a Chronicle of Local Events, from 1741 to 1841." Compiled and edited by JOHN ALFRED LANGFORD: Birmingham, E.C. Osborne. 1868.

To the numerous histories and memorials of Birmingham already existing, Mr. Langford has added another. He has ransacked the files of *Aris's Journal*, from its commencement in 1741 to 1841, and has collected together a vast amount of information, in the shape of newspaper extracts and advertisements respecting the appearance, habits, customs, amusements of Birmingham in days gone by. A good deal of said information is not, we suspect, of a kind likely to interest much anybody but a native. But to him the work will be an entertaining *Olla Podrida*, and it will afford abundance of raw material which a local historian may work with advantage. The present bulky book—which must have entailed a considerable amount of labour and research on the part of the compiler—is only the first volume of the chronicle. Among other interesting facts we learn that Birmingham, which in the time of William the Conqueror was an insignificant hamlet, has now property of the annual ratal of more than a million pounds; the town is more than 5 miles in length and 3 miles in breadth, and covers an area of upwards of 7,800 acres. It has more than 200 miles of streets, which contain something like 60,000 houses. It is also worth noting that there are, at least, 140 ways of spelling the name of the town, as appears from a list given by Mr. Langford.

"The Year Book of Science and Art, exhibiting the most Important Discoveries and Improvements of the Past Year." By JOHN TIMBS, F.S.A.: Lockwood and Co. 1868.

WE only notice Mr. Timbs's now well-known publication to say that the new volume is in every respect identical with its predecessors, except as to the introduction, which this year is devoted to a notice of the life of Sir Samuel Baker, the African traveller, of whom a steel portrait is given. The rest of the contents is of the same varied and useful character as hitherto.

BUILDING AND LAND SOCIETIES.

THE London and Suburban Land and Building Society held its ninth ordinary meeting of shareholders at the London Tavern, last week, Mr. Coleman presided. The report of the directors stated that the total amount of land sold during the half year ending the 31st December last upon the several estates had been £10,202. The number of shares issued during the same period had been 2,879, leaving 1,174 to be disposed of to complete the share list. From the amount of profit standing to the credit of the company the directors had resolved to take the sum of £2,500 and add to the reserve account, leaving a balance of £3,627 5s., out of which they recommended the declaration of a dividend at the rate of ten per cent. per annum. The report was adopted.

The fifteenth annual meeting of the shareholders of the Leicester Permanent Building Society was held the other day. The report shows the society to be in a prosperous and progressive condition. During the year 795 new shares have been issued, making a nett increase of 316¼ shares, and leaving 4,235½ shares on the books at the close of the

fifteenth year. The amount advanced upon mortgage to borrowing members has been £21,800; the amount paid for invested shares completed £3,332 17s. 6d., and for shares withdrawn £4,155 11s. The total receipts for subscriptions have been from borrowers £14,735 18s., and from investors £17,952 3s. 6d., making together £32,688 1s. 6d., being an average monthly receipt of £2,724, and an increase on the previous year of £2,577 14s. 9d. The amount of securities at present held by the trustees is £121,750.

In their sixth annual report, just published, the directors of the Aberdeen Association for the Improvement of the Dwellings of the Labouring Classes state that their house property at Gilcomston terrace has yielded a gross return on the expended capital of 8½ per cent., and a free return of about 5 per cent. The Lock-street property shows a gross return of £9 2s. per cent., and a free return of 6½ per cent., while other dwellings of the association have yielded as high a gross return as 17½ per cent. The total rent of the whole properties was £322 14s. 5d. for the year, being a return of 9 per cent. on £3,588 5s. 9d., the capital expended. It may be stated that the society's new dwellings are built of coursed granite rubble work, with close picked granite dressings. The walls are 2ft. and 2ft. 6in. thick, old Scotch style, with crow-stepped gables. There are ash shafts and water closets for females on each stair landing, and an outside iron range of water-closets for males; iron sinks with hinged covers, water, and gas in each room; common washing-house and bleaching green to each house, and a large coal cellar in basement to each tenement. The tenements consist generally of room and bed closet, or room and two bed closets; and the average total cost of each, including architect's fees and every other charge, amounts to £48, but, counting the rooms and bed closet, the average cost amounts to only £30 for each apartment. Iron bedsteads and cupboards are furnished to each room. The architect is Mr. D. Macandrew. The directors declare a dividend at the rate of 4½ per cent.

The annual meeting of the shareholders of the British Land Company, Limited, will be held in the Guildhall Tavern to-day. The report states that the sales for the year, including timber and materials, have amounted to £205,757. After paying the interim dividend of 5 per cent. amounting to £7,500 the balance sheet shows a profit of £35,398, and out of this sum the directors recommend a further dividend of 5 per cent. and a bonus of 10 per cent. free of income tax, making 20 per cent. for the year, and leaving a balance of £12,898 to be carried forward.

A determination "to keep on the safe side of the hedge," is certainly an admirable resolve, and one that must bring its own reward. This, according to Mr. Tweedie, its chairman, is the determination of the Temperance Permanent Land and Building Society, and the result of its wise policy may be seen in the state of its affairs. The fourteenth annual general meeting of the shareholders was held on Wednesday. The report showed great progress in the transactions of the society. The total receipts of the year had been £67,000 in excess of those of the preceding year; £230,000 had been advanced on houses, being £108,000 more than in the previous year, there having been at the end of the year a total of £197,000 out on mortgage. A tabular statement of the shares and assets showed a regular increase from 1854 to 1867—from 450 shares in the former year and £1,650 assets, to 67,633 shares at the end of 1867, with assets amounting to £592,981, or above half a million. More than £900,000 had up to this time been lent out on mortgage, and the reserve fund had increased to £62,000. But, though the business had increased, and the benefits of the society had been spread over a large area, the profits had not increased beyond the 7½ per cent. Regret was expressed at the retirement of Mr. Benjamin Scott, whose engagements no longer permitted him to continue to act as trustee; also at the death of Mr. William Jansen, who had been arbitrator. The directors also regretted that Mr. Thomas Beggs had been compelled, from want of leisure, to resign the office of arbitrator.

WATER SUPPLY AND SANITARY MATTERS.

At a meeting of the Dewsbury, Batley, and Heckmondwike Waterworks Committee, last week, a number of tenders for the repair of Dunford Bridge Reservoir, and the construction of one in Windleden Clough, were considered. The tender of Mr. J. B. Macguire, of Ulverston, contractor, to execute the works required for the sum of £25,900 3s. was accepted. This was the lowest tender. The works are to be completed in three years.

Dr. Liddel, the Medical Officer of Health in the Whitechapel district, has just published his report for 1867. The document gives returns showing the amount of work performed by the Sanitary Inspectors in that East-end quarter during the year. The number of rooms found to be overcrowded, the space being less than 300 cubic feet for each person, reckoning two children for each adult, was 121, and as many as 150 cases of indecent occupation were discovered. Measures were taken to have these remedied. In addition 13 cellars used as dwellings were cleared of their inmates, and 65 other houses were closed as being unfit for human habitation. In 238 instances dust-bins were provided; water butts in 343; drains improved in 510; cesspools were abolished in 44; and the houses in which the rooms and passages have been whitewashed amounted to 1,143. These figures prove that nowhere is there so much need for the Sanitary Inspector to be abroad as in Whitechapel.

Building Intelligence.

CHURCHES AND CHAPELS.

The new church of St. Mary, Compton Abbas, Dorset, was consecrated on Tuesday last, by the Bishop of Salisbury. The old church and parsonage, which were in a very dilapidated state, have been pulled down, and both rebuilt on a more convenient site. In taking down the old church some rude frescoes were discovered on the walls. The whole of the walls had evidently been covered at two separate periods with frescoes. A curious old hammer beam roof was also found in pulling down the parsonage, with oak timber, wrought and chamfered, which had evidently been an open roof at one time. The timbers were framed to form a trefoil. It may have been brought from the neighbouring town of Shaftesbury, when the monastery there was destroyed. The new church is in the Early English style, and consists of nave, south aisle, porch (under tower on the south side of the church), chancel, and vestry, and the tower is crowned with a handsome broach spire. The chancel has a groined ceiling, the ribs of which are supported by Devonshire marble columns; the capitals and intersections of the ribs are richly carved. The church will accommodate 250 people, and the south aisle is fitted up for the children. Both the church and parsonage adjoining are built of Melbury ragstone, with Doulting stone dressings. The architect was Mr. G. Evans, of Wimborne Minster, and the builder, Mr. A. Green, of Blandford, Dorset.

The parish church of Batheaston, near Bristol, was reopened last week after undergoing considerable alteration and restoration. A new aisle has been built, the south gallery over the west of the nave has been removed, the tower arch has been thrown open, and the church has been reseated throughout. The architect was Mr. F. Preedy, of London, and the contractors were Mr. Newman, of Bathford, and Mr. Silver, of Maidenhead. The cost of the restoration has been between £1,800 and £1,900.

The chancel stone of a new church to be dedicated to St. John, at Meads, Eastbourne, has been laid. The edifice is to consist of chancel, nave, tower, spire, and aisles. It will be in the Decorated style, and will accommodate 450 persons. The architect is Mr. H. E. Rumble, and the builder, Mr. James Peerless, both of Eastbourne.

The newly erected church of St. Stephen's, Newcastle, was consecrated on Thursday week by the Bishop of Durham. The style of the building is Early Geometrical Pointed. It consists of nave, chancel, and south aisle, with provision for the future addition of a north aisle. The chancel is 34ft. 6in. long by 26ft. wide; the nave 82ft. 3in. by 29ft.; and the south aisle 82ft. 9in. by 18ft 7in. The cost of the building is £5,700. Mr. Johnson, of Newcastle, is the architect; Mr. Walter Scott, the contractor for the masonry; and Mr. Joseph White for the carpenters' and joiners' work.

Some workmen lately employed at Holy Trinity Church, Milton, near Sittingbourne, scraping the walls of the east end of the north aisle previous to whitewashing, uncovered some ancient paintings, which appear to have been of a diaper pattern, parallelograms of a foot long and nine inches deep. The colours employed were red, blue, and yellow, and in some places they are still very bright.

The church of St. Barnabas at Burnmoor, Durham, was consecrated on Tuesday by the Bishop of the diocese. It is built in the Early Geometrical style, from designs provided by Mr. R. J. Johnson, of the firm of Austin and Johnson, Newcastle. The material used for the walls is variegated bricks, the roof of the nave being supported by two stone pillars with ornamented capitals. The stone and masonry work was performed by Mr. Hudspeth, of Alnwick, the joiners' and painters' work by Messrs. Charlton and Co., of Newcastle.

The corner-stone has been laid of a new chapel in Chapel-lane, Bradford. The building was designed by Messrs. Andrews, Son, and Pepper, architects, of Bradford, and is in the French Gothic style, and will cost the sum of £5000.

Mr. Wm. Morris sends the following:—"Will you oblige by correcting an error in the Building News respecting the re-opening of St. Andrew's Church, Blunsdon, Highworth; Mr. Butterfield is the architect, I am clerk of works under that gentleman."

The foundation stone of a new Roman Catholic church at Longton will be shortly laid. The design, which is by Mr. E. W. Pugin, is in the Late English style of architecture, and consists of a nave, with side aisles and chancel; a clerestory will divide the roof of the nave from the lower roof of the aisles, the outside walls of which will be supported by buttresses. The walls will be of brick, with stone dressings. The edifice will seat 1000 persons.

On Tuesday, the Bishop of Tennessee laid the foundation stone of the third church which is at present being built in the populous district of St. Mary, Haggerstone. The church of St. Chad will be from the design of Mr. Brooks, the architect of St. Michael's Shoreditch, and is to consist of a nave of red brick, groined with brick, an apsidal chancel with two vestries on the north side, and a narthex, or covered porch, at the west end. It will seat 750 persons, and will cost £6500, exclusive of the site, the price of which was about £3000. To these three churches, which are all being "worked" on High Church principles, one gentleman gave the munificent sum of £10,000.

Mr. Gilbert Scott estimates that the sum of £53,000 will be required for the restoration of Chester Cathedral, "as it deserves to be restored." The Ecclesiastical Commissioners have offered to give £10,000 towards the work, and certain noblemen and gentry in the diocese have promised to contribute liberally. The following is the estimate of the cost of restoration:—Necessarry repairs, £22,531; desirable repairs, £7,000; improvements, £20,000; total, £49,531; and architect's commission (5 per cent.), £2,500—£52,031. Desirable repairs include flying buttresses, restoration of cloisters, king's school, and bottom stage of west Norman tower, with lead instead of slate on the roof. Improvements include stone groining of the nave and aisles, restoration of the tower and spire, internal cleansing and repairing, and complete restoration of the choir.

BUILDINGS.

The Committee of the Travellers' Club have determined, during the ensuing autumn, to restore the balconies of the south front of their Club House to their original condition, as designed by Sir Charles Barry.

A college for young women—in the Oxford sense—is spoken of. The buildings, with accommodation for 100 students, are estimated to cost £30,000. It is proposed that the college should be situated somewhere between London and Cambridge.

The first stone of a new school in connection with the church of St. John the Evangelist, Leeds, was laid on Monday. The building, which is in the Gothic style, will accommodate 400 children, and is to cost £2,300. The walls will be built of pressed brick, with stone window dressings. Mr. John Simpson is the architect; the contractors are Messrs. Garland and Sons, bricklayers, and Mr. M. Spence, mason.

The rebuilding of the burnt part of Constantinople is making progress, but very slowly. Mr. Street's memorial church in Pera is approaching completion. The palace of Aali Pasha, the Grand Vizier, has sustained the usual fate of being consumed by fire. The rebuilding of the burnt palace of H.H. Fuad Pasha has been checked. The Sultan had undertaken the completion at the public cost, and directed it to be adorned with marble and gilding, notwithstanding the preference of Fuad for humbler material. After a Palace intrigue the Sultan took umbrage with Fuad, and the minister surrendered the title deeds to the sovereign. The old Sublime Porte of the Seraglio, the Bab Humayoon, having become inconvenient, has been pulled down, and is being replaced by another gateway. Expectation has been excited that the fresh granted Adrianople railway will be begun in the neighbourhood of the metropolis.

Messrs. Kirk, building contractors to the War Department in the Royal Arsenal, Woolwich, last week commenced laying the foundations of the seven magazines ordered to be erected on the river bank in the arsenal marsh.

A letter from the Metropolitan Board of Works was read at a meeting of the City Commissioners of Sewers on Tuesday, which announced that the Board had voted in aid of the Mansion House improvement the sum of £7,354, and in aid of widening the west-end of Ludgate-hill the sum of £11,756.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—H. R. E.—H L.—I. T. and T. W.—T. E—I. W. W.—R. H. V.—S. and B.—M. and Co.—S. D.—R. P.—W. S.—I. D. P.—R. B.—P. and K—M. and Co.—W. L—E. P.—B. W.—S. J H.—T. E. B.—I B. O.—H. G.—I. T. D.—M. O. *** Several "Intercommunication" questions, &c., are postponed.

B. C.—You can have the back numbers from the middle of last year.

W. S. C.—Poetry, unless it be like refined gold, is inadmissible in our pages. Your lines being simply execrable are in the waste basket. If W. S. C. ever sent such lines to a lover as those sent to us, he deserves to be jilted.

Correspondence.

MR. TARVER ON SYMMETRY.

To the Editor of the BUILDING NEWS.

SIR,—Mr. Tarver is a young man—a very young man: when he is some twelve years older he will feel how very strange it was that at his present age he should have taken up about the most abstruse subject in the whole range of art. Questions like Pure Beauty, Symmetry, Composition, &c., are abstract ideas of which it is a part of metaphysics to treat. To speak of these subjects in anything like an objective manner for the practical guidance of the artist is impossible, as all artists know. The great artist feels rightly on these points, but he can give no rules that have not endless exceptions. That which is an abstract idea in philosophy, and is beyond human reason to define definitely, will, in an objective form, be equally indefinable. To Mr. Tarver one may say, read your Plato, Aristotle, Schelling, Gioberti—learn something of the abstract idea if you can. As an artist, follow the admirable advice of Mr. Burges, given many years ago:—Draw and measure. Does it not strike Mr. Tarver that the man who has measured and drawn to scale more mediæval buildings than anybody in Europe, always, in his lectures, confines himself to objective facts? When a young man talks about symmetry of the Middle Ages and Renaissance, we ask, what does he know about these great works of the past? How many of the magnificent French cathedrals has Mr. Tarver drawn to scale, or any parts of them? because these drawings are valuable, and should be exhibited. There are comparatively few in the country. Has Mr. Tarver ever made drawings of any of Wren's works. St. Paul's is not usually considered to be wanting in symmetry. Michael Angelo and Bramante are not habitually spoken of as ignorant of this quality in art. Has Mr. Tarver ever drawn a Classic building? Can he draw the orders? Has he ever seen an ancient Greek or Roman building? To make invidious remarks about Classic and Gothic at this moment shows unfortunately inability to understand the current of present thought on the subject. The great artists in all ages have the same feelings regarding symmetry. The Greek, the Mediæval, the Renaissance artist felt alike. All great works of art, it matters not what age, possess symmetry. The decorative forms change, but the first principles of beauty, indefinable as they are, remain for ever. Just as humanity is incapable of producing a perfect work in any age, so also no age is without work of merit, and of very high merit. There is change, development in the human mind; but, just as there never exists absolute perfection, so also there is never absolute incapacity. Whether we hold a philosophy of progression or not, this fact remains, and a philosophy of history is not possible without it.—I am, &c, A. O. X.

COCOA NUT FIBRE.

SIR,—Having read Mr. Morton's letter of the 14th, and your reply of the 15th inst., respecting the inflammable nature of cocoa nut fibre, I will gladly bear my testimony to the truth of your assertion, "that it is not inflammable." That it cannot be consumed by fire, without great difficulty, I have many times experienced during many years residence in Bombay, Kurrachee, and other parts of India, where, in cases of cholera and other infectious diseases, I have superintended the destroying of beds, &c., made of that material. I have no interest in the trade, but have strongly recommended it for hospital purposes. I have myself slept on a cocoa nut fibre bed for many years. It is much cooler than any other material, and can easily be cleansed and remade.—I am, Sir, &c.,

J. GARDNER.

46, Albert-street, Newington Butts, Feb. 18.

THE BARRY-PUGIN CONTROVERSY.

SIR,—I have received the enclosed two very important letters from Mr. Herbert, the R.A., which I shall feel obliged by your inserting in your columns at your earliest convenience.—Yours faithfully,

21, Savile-row, Feb. 25. E. WELBY PUGIN.

7, Grove-end-place, St. John's-wood-road,
Feb. 24, 1868.

DEAR EDWARD PUGIN,—I was at the Grange when your father made the drawing for the throne. I have a distinct recollection of being there at that time. I was at work on the same board with your father when the post brought a packet from the then Mr. Barry. It was a drawing of the throne made by your father, treated as a pointed shrine, as if to enshrine Royalty, and covered with magnificent tabernacle work, and going high up towards the roof of the House of Lords. This was a very fine thing indeed, and your father had fixed his heart upon it. In the packet was also a small sketch, treated as a baldequin, square headed, and in a very few lines, barely enough to indicate what it was. Now, why I so well remember this was that your father turned to me, and with his unusual quiet sadness, said, "He spoils everything I do." These are the exact words, and I shall never forget them. But he went out to the study place, and remarked, "Barry wants a 'testa.'" Some days after this he was engaged upon the throne by my side, and I saw him make the design entirely for the present throne.

I had written thus far before seeing the frontispiece of Dr. Barry's pamphlet, and to my utter astonishment I find the photograph is taken from the actual drawing made under my eye; but, independent of my evidence, it must be clear to any one, though not an artist, that the man who could have made this drawing must have had your father's power of doing all that he accomplished before or after. Knowing this I am shocked at seeing Messrs. Barry should have made so grave an error.—Believe me, dear Edward Pugin, always faithfully yours, J. R. HERBERT.

E. Pugin, Esq.

7, Grove-end-place, Friday, February 21, 1868.

MY DEAR EDWARD PUGIN,—I think you may now wholly withdraw from further anxiety or trouble in the question of "who was the art-architect of the palace at Westminster."

The admitted destruction of the thousands of drawings made by your father for Sir Charles Barry, together with the 76 letters entrusted to him under the promise that they should be returned and held by his executors, declare even painfully, but most emphatically, to any man of honour, the justice and truth of the claim made in your pamphlet.

You may quite rely upon it that the article in the "Standard" of the 20th inst., so thoroughly logical and fair, has placed your father's claim beyond dispute; and the public, always desirous to give honour where honour is due, will, though late, insist that your father's name shall go down to posterity as not less than the joint architect of the Palace of Westminster.—Believe me, dear Edward Pugin, always faithfully yours,

Edward Pugin, Esq. J. R. HERBERT.

SANDGATE TOWNHALL COMPETITION.

SIR,—Seeing an advertisement in your impression of February 14, of a competition for "Townhall, Sandgate," I made application for particulars issued to intending competitors, and I find, upon looking over the few almost useless (written) instructions, that no requirements are stated, except that the directors say—"The greatest amount of accommodation at the least cost is the desired object;" and I should really be disposed to believe them, as they state that "Three guineas will be allowed for selected drawings." The secretary writes as follows:—

SIR,—The enclosed has been sent to all applicants. It is intended to guard against accepting designs furnished by some irresponsible designers. The gentleman is expected to sell his design for three guineas. As far as can be, the designer will be retained to carry out the work upon terms to be arranged. The directors are in earnest to select a design without impartiality.—In haste, yours obediently,
(Signed) J. H. HEDGE.

No comment upon this letter is needed, but what can we say to "responsible designers," who would so forget the dignity of their profession as to think for one moment of sending in drawings for this "townhall?" You would confer a great boon on the profession if you would bring your powerful aid to teach boards and "limited companies" that "responsible designers" are not educated through long years to make and "sell" drawings at "three guineas" per set.—I am, &c.,

GEORGE JAMES LOUGH.

67, Tachbrook-street, February 19.

THE COLOSSEUM.

SIR,—I have read with considerable interest your article on "The Colosseum," in the BUILDING NEWS of this week, and beg leave to inform you that it was the intention of some gentlemen some time ago to set on foot a club for young men, and circulars were distributed to that effect; but, as I have heard of nothing further with regard to the subject, I presume it has been abandoned with despair. Nevertheless, I hoped that it would come to something, as it would be a very good thing for young men and youths in the vicinity, as the following circular will show, a copy of one sent to me when the subject was first started. If you would wish to make this known to your correspondents, perhaps a word or two in your valuable journal might again stimulate the gentlemen to persevere in endeavouring to raise a club which would prove so advantageous to young clerks, &c., of London.—I am, &c.,

C. FULLER.

8, Gloucester-crescent, Regent's Park, London, N.W., February 21.

[COPY OF CIRCULAR.]

COLOSSEUM CLUB.

SIR,—At the request of the provisional committee of the above-named club, I beg to lay before you the object contemplated—viz., to convert the Colosseum, Regent's Park, into a club-house for young men engaged in professional and commercial pursuits. It is estimated that accommodation will thus be afforded for 500 resident and 1,000 non-resident subscribers, for whom a lecture hall, reading, dining, class, and billiard rooms (swimming-bath, if possible), and every other convenience would be provided to ensure a comfortable home, combining facilities for intellectual improvement with all kinds of rational exercise and amusement, including frequent musical entertainments, &c. Members can be supplied with breakfasts, dinners, &c, at cost prices, but no wines, beer, or spirits, will be obtainable on the premises. The rent for a single

a [illegible], with all the ordinary advantages of the club, will [illegible] per week, according to the position of the room; but any member wishing a private sitting-room [illegible] may be accommodated therewith at a proportionate rate. The estimated capital for purchasing, altering, and thoroughly furnishing the aforesaid building [illegible] to be raised by [illegible] shares of £5 fully paid up. After very carefully going into estimated receipts and expenditure, the committee have every reason to believe that the nett profits will not only provide for repayment of the original outlay at the expiration of the lease, but also pay a dividend of at least [illegible] per cent. per annum. A large amount of the capital is expected to be subscribed by City merchants, of whom two have already promised £[illegible] each; but [illegible] desirable to raise as much as possible [illegible] themselves, as it is [illegible] that [illegible] in the undertaking should [illegible] of the club, and thus create a [illegible] the present [illegible] interest young men [illegible] of premises of [illegible] depend whether the committee will [illegible] several gentlemen of [illegible] influence and support to [illegible]. If an earnest desire to establish the club be manifested by young men. Any further information you may desire will be immediately furnished on your applying to Mr. H. Tregarthen, the hon. secretary, *pro tem.*, at the [illegible] address. On behalf of the provisional committee.—I am, &c., John Rogers,

Incumbent of St. Thomas, Charterhouse, Chairman.

[illegible] Brunswick-square, W.C., October 15, 1867.

Intercommunication.

QUESTIONS.

[751.]—ROOFAGE WATER.—The superficial area of my roofs are about [illegible] ft. I am desirous of collecting the rain water in an underground tank. I shall feel obliged if some of your correspondents would inform me the required dimensions I should build it (my farmstead is situated in the midland counties of England), the average gauge per annum, and the rule employed for finding the number of gallons I could calculate for in one superficial foot of roof?—M. Payne.

[illegible]—CREOSOTING.—How long should a balk of Memel timber remain in a creosoting tank so as to absorb 10 lbs. of creosote to the foot cube?—J. R. P.

[illegible]—STOCK BRICKS.—Why is it the universal practice of making stock bricks [illegible] in. by 4½ in. by 3in.; and why should they not be made [illegible] in. by [illegible] in. by 6in.?—M.

[illegible]—FLEXIBLE IVORY.—Can you, through the Intercommunication, tell how I can make ivory flexible, and also how to restore it to its original rigid condition?—[illegible].

[illegible]—INDIA RUBBER.—I want a book describing the process of manufacturing india rubber, and especially the [illegible]. Can any of your readers direct me to a book, or give me any information on the subject?—Chisale.

[756.]—CONTOURS OF MOULDINGS.—Will some readers of the Building News inform me how to obtain the correct contours of the mouldings in an existing building? Is there not an instrument for the purpose?—J. K. J.

[illegible]—WATER.—Can you or any of your readers inform me where I can obtain the requisite information to enable me to determine the amount and nature of foreign ingredients held in suspension by water?—G. F. L.

[illegible]—EGG SHAPED SEWERS.—Can you or any of your readers inform me how to work out the formula ([illegible]) for determining the size of egg shaped sewers given in Mr. Weale's "Engineers and Architects' Pocket-Book," as Mr. Hawksley's?—G. F. L.

[illegible]—FREESTONE CHIMNEY PIECES.—Would any of your numerous readers oblige by informing me of any [illegible] with which a light freestone chimney piece might be [illegible], so as to preserve it from injury by finger marks or greasy [illegible]—S. B.

[illegible]—QUANTITIES.—Which is the best work on taking quantities? [illegible] timber [illegible] is easily obtainable; the correct [illegible] the same at other distances [illegible] and respectfully solicited. Can an architect demand a copy of a bill of quantities taken by a surveyor for contractors at their own cost; or, is it a matter of courtesy to furnish him with it free of cost?—F.

[761.] CLEARING AWAY SNOW.—In November, 1867, in the Building News, suggestions were invited to clear away snow from the streets of the City, to be sent to the principal clerk at Guildhall—£50 for the first, £20 for the second that the Committee thought most suitable. I have looked through your paper most weeks, but have not seen any conclusions come to; if you have heard anything of it, an intimation in your next week's paper would oblige.—Interested.

[This matter is adjourned, waiting the results of experiments to be made. The result will be advertised in due course.]

REPLIES.

[742.]—ILLEGIBLE INSCRIPTIONS ON SILVER COINS.—Look at them very obliquely through a convex lens of long focus, such as a spectacle glass, or, to get more power, in the same way with a double eyeglass folded up. So also for marks on old plates.—J. G. C.

STATUES, MEMORIALS, ETC.

An allegorical group in sculpture has been erected in the Parish Church, Leeds, as a memorial to the late Mr. W. Beckett, banker, and formerly M.P. for Leeds. The monument, which is in marble, is 1[illegible]ft. high with the pedestal, the centre of which is occupied with a medallion likeness of the deceased. Baron Marochetti was the sculptor, and the monument has been erected under the superintendence of Messrs. Dobson and Chorley, architects, Leeds.

LEGAL INTELLIGENCE.

Building Bye-Laws.—The Corporation of Leeds the other day summoned Mr. A. Hallbrook, of Carr-moor Side, Hunslet, a builder, in order to enforce the provisions of the 11th Building Bye Law, which says that "party walls of all buildings shall not be less than 12in. in thickness if built of stone, and 9in. in thickness if built of brick. It appeared that the defendant was erecting eight houses, the party walls of which, instead of being 9in., were only 5in., and the buildings were not in accordance with the plans he had sent in to the Building Committee. The magistrates, after hearing the evidence, inflicted a fine of 20s. and costs, and further adjudged that there would be a penalty of 40s. per day for non-fulfilment of the building in conformity with the plans, but that such 40s. would not commence until March 31, so as to give the defendant an opportunity of making his building according to the plans he had deposited.

Our Office Table.

The Home Secretary, on Monday, in answer to a question by Mr. Candlish, intimated that he was not prepared to legislate on the subject of the pollution of rivers this session. The old commission, he stated, had been dissolved, and a new one was about to be appointed to inquire into the whole matter; and Mr. Hardy did not think it desirable to do anything on the subject until their inquiry was completed. On the same day Mr. Ewart obtained leave to introduce a bill, which he does annually, for the adoption of the metric system of weights and measures.

The death is announced, at the age of 78, of Mr. John Herapath, well known as the proprietor of "Herapath's Railway Journal," and as author of "Mathematical Papers." He was first cousin to Mr. William Herapath, of Bristol, the celebrated analytical chemist, whose decease we announced only last week.

A conference of persons interested in the establishment of museums and libraries will be held on Thursday, March 5 next, in the hall of Sion College, London.

We recently stated that Mr. G. Dobie, painter and decorator, of George-street, Edinburgh, had offered a series of prizes for the best designs of drawing-room and dining-room decoration, the competition being open to the whole of Scotland. Thirty-six competitors entered, and the result has been a very creditable display of artistic skill. Some of the designs—which are now on view at Mr. Dobie's place—are said to be of a very high class. The gentlemen who acted as judges in the competition were Messrs. J. Dick Peddie, (architect); James Ballantine, (artist in stained glass); John Nisbet, Edinburgh; R. Dow, Perth; and J. B. Bennett, Glasgow. Their decisions were as follows:—Drawing-room—1st prize (20 guineas), William Luetjens, Glasgow; 2nd (10 guineas), Alexander Girdwood, Edinburgh; 3rd (5 guineas), Matthew Hislop, Langholm. Dining-room—1st prize (10 guineas), Alexander Girdwood, Edinburgh; 2nd (5 guineas), William Luetjens, Glasgow, 3rd (2½ guineas), Anthony Wells, Glasgow.

The municipality of the City of Paris has just determined, for reasons of economy, to have every other gas lamp in the streets of the capital extinguished after midnight. This measure is to come into operation next month. The saving is incontestible, but the police, when informed of the intention, made some just observations as to the difficulties which the arrangements will introduce into their surveillance.

The trustees of the Clyde navigation at a meeting lately held in Glasgow resolved to ask for borrowing powers to the extent of £600,000 in the bill for the formation of a new graving-dock, which the trustees intend to bring before the present session of Parliament.

Since the establishment of the Masons' Society in 1840, they have expended for benevolent purposes alone £102,181; for trade purposes £62,182.

A second collection of Artizans' Essays on the comparative merits of British and continental industry and manufactures will shortly be published. These essays will emanate from the Paris Excursion Committee.

Certain native artists, it is said, when they would drill a hole in pearls, first fit them loosely in apertures bored in a piece of wood. Then a little water is sprinkled around them, which gradually penetrates the fibres and causes the wood to "swell," until each little pearl is held as firmly as in a vice. Indeed, no vice could hold such delicate little treasures without marring them and diminishing their value. But by this simple process, which might be applied to other purposes, the choicest ones are kept securely in their places, without injury, until the artist's work is done, and then, as the water dries out, the fibres gently relax, and the pearl is free.

A correspondent states:—My object in writing is to warn you and your readers that Temple Bar is no longer safe, and to recommend that it be either shored up or pulled down without delay, for when I passed it on Saturday afternoon I not only discovered several fresh cracks in the masonry, but saw that the old ones had increased in length and breadth. This new "settlement" may have been caused by the disturbance of some part of the northern abutment during the removal of the houses for the Law Courts.

Although forty years have elapsed since Ali Pasha gave "Cleopatra's Needle" to George IV. it still lies outside Alexandria. We understand certain savants have been in communication with the Government, with a view to bring the time-worn monolith to England. It is said that £20,000 would be required to accomplish the project.

Now that the necessary legislative powers have been obtained, there is every reason to think that the erection of the East London Museum will be commenced immediately. The site is at the junction of the Bethnal-green-road with the Cambridge-heath-road, leading from Whitechapel to Hackney, and about half a mile distant from Victoria Park.

We announce, with pleasure, that the next annual dinner, or we suppose we may now say banquet, of the Hardware and Metal Trades Society, will be graced by the presence of ladies. The appearance of ladies at the annual dinners of charitable and other institutions will do much to make such festivals worthy of the objects they profess to promote. As now conducted they smack of vulgarity and selfishness.

The Summer Session of the Female School of Art (43, Queen's-square, W.C.) will commence on the 2nd of March. Professor Donaldson will give a series of lectures on the principles of shadow, and Mr. O'Neil, A.R.A., a series on painting, in the course of the session.

A sale of much interest to art collectors is announced to take place at Munich on the 16th of next month. The collection of M. Entres, a sculptor, will be brought to the hammer. It is exactly fifty years ago—in 1818—since that gentleman began to amass all that he could find bearing on the history and development of German art, and the result of his labours is a collection which is said to be rare both in the number of the objects brought together and their, in some cases, almost inestimable value. The sculptures in wood and ivory, we are told, are quite unique. There are also the finest impressions of the rarest engravings, woodcuts, and etchings, besides original drawings by Raphael, Corregio, Rubens, Rembrandt, Domichino, and other great artists. The pictures of the old German school give a perfect history of the art. The Flemish, Dutch, French, and Italian masters are also well represented. There are caskets in the precious metals so admirably wrought, that the material becomes insignificant beside the workmanship. The fact that there are in all nearly 4,000 lots will give some idea of M. Entres's collection, and, on looking at all the efforts of skill and genius, one is at a loss, as a correspondent remarks, to understand how a private individual could become the possessor of such a museum.

Mr. Boucicault has, it is said, purchased the Sablonière Hotel, Leicester-square, intending to convert it into a theatre.

The Hardware and Metal Trades Pension Society has been in existence for many years, during which time it has done an untold amount of good. The society was instituted for granting annuities to aged and deserving members of the above-mentioned trades and their widows. As an evidence of the growth of the society, we may mention that in 1856 its annual income was £1,155, and in 1868 its income amounted to £2,612. In the former year 60 pensions were granted, and in 1867, 132 pensions were granted. Of this number 57 were men and 67 were women. The annual ball of the society came off at Willis's Rooms, a few nights since, and, as usual, it was characterized by overflowing numbers, bewitching beauty, and brimming satisfaction. Our notice of the society would be incomplete without associating with it the name of Lieut.-Col. Stedall, who for many years has lovingly and energetically promoted its prosperity.

MEETINGS FOR THE WEEK.

MON.—Society of Engineers.—Discussion on "Papers read on the Surveys of the Proposed Lines for a Ship Canal between the Atlantic an Pacific on the Panama Railroad;" and, on the "Darien Ship Canal," by Dr. Cullen, 7 30.

TUES.—Institution of Civil Engineers.—"On the Manufacture and wear of Rails;" by Mr. C. P. Sandberg, Assoc. Inst. C.E., 8.

WED.—Society of Arts.—"A Workman's Views of Technical Education;" by Mr. J. Randall, one of the artizan Reporters on the Paris Exhibition.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

1660 B. TEMPLAR. IMPROVEMENTS IN FASTENINGS FOR WINDOW SASHES. Dated June 6, 1867.

This invention consists in making the fastenings of window sashes self-acting, so that when the window is closed, the sashes are securely connected together, and cannot be opened from the outside. Another part of the invention, which is applicable to fastenings of the ordinary construction, as well as to these improved fastenings, consists in making the casement plate of the bracket of the bottom sash to overlap that of the other, to prevent the introduction of a knife blade or other instrument in order to throw back the catch.—Patent completed.

1855 W. COOKE. IMPROVED APPARATUS FOR HOISTING BUILDING MATERIALS. Dated June 25, 1867.

This invention consists, principally, of a single fall or endless rope passing over a grooved pulley above, and having fixed, or connected to it, appliances for attaching two hods thereto, so that when the full one is being hoisted the empty one is descending.—Patent abandoned.

1919 P. IRONSIDE. IMPROVEMENTS IN THE CONSTRUCTION OF VENETIAN BLINDS OR SHUTTERS. Dated July 1, 1867.

Here a vertical rod is laid in a groove, and each lath carries an arm which, besides passing through the vertical rod, rests in bearings formed in the sides of the groove. The vertical rod has a slot at its central part for each lath, and each lath receives a disc, eccentric, or plate, and through which each arm of each lath passes; pins also pass through the projecting points of each disc or eccentric; therefore, the arm of each lath is tied, as it were, in two places to the vertical rod; thus when motion is communicated to the vertical rod, whether causing it to rise or fall, so the discs turn the arms of the laths and alter the position thereof, as desired.—Patent completed.

1845 J. WEBSTER. A NEW METALLIC ZINC PAINT. Dated June 25, 1867.

The patentee takes spelter and melts it in a furnace, and raises it to 800 deg. Fah. He then covers the metal with a flux of borax mixed with caustic of soda or chloride of ammonia. He then adds about 7 or 8 per cent. of finely divided iron wire or scrap, agitating the whole with an iron rod until the whole of the iron or scrap particles are taken up by the zinc. He then adds sufficient antimony to cause the metal to run freely from the furnace. When the metal thus prepared has cooled down it is next pulverized and ground, when it may be mixed with any oleaginous matter or varnish, and the metallic zinc paint results.—Patent completed.

1902 A. HODGE. IMPROVEMENTS IN ADJUSTABLE APPLIANCES FOR FIXING DOOR HANDLES. Dated June 29, 1867.

This invention consists in adapting an internally screwed collar to screw upon the screwed edges of the square or equivalently shaped spindle, such collar holding the handle by a flange or rim turned over a bead or flange on the neck of the handle, and being prevented from unscrewing from friction against the door or shield by an interposed disc loose on the spindle, but fitted so as not to turn thereon.—Patent completed.

1953 T. WELTON. A NEW REVOLVING SHUTTER OR BLIND, TO BE APPLIED EITHER INSIDE OR OUTSIDE OF HOUSES OR OTHER BUILDINGS. Dated July 4, 1867.

This invention consists in making a shutter or blind of sheet iron or steel, so that each part (described as plates) interlocks with the other and others, and so forms a continuous hinge or hinges, to the front of which may be affixed laths of wood, or metallic bars of the required thickness of any sectional form or width, either as regards the plates, otherwise hinges, or the outside covering (if any) of iron or wood.—Patent abandoned.

1927 J. STURGEON. IMPROVEMENTS IN MACHINERY EMPLOYED IN GETTING COAL, STONE, AND OTHER MINERALS, AND IN APPARATUS CONNECTED THEREWITH. Dated July 2, 1867.

The chief object of this invention is to produce a machine capable of performing the principal operations required in tunnelling or making a drift, long wall, cutting or pillar and stall cutting, or to work at an irregular face of coal of any length. The patentee employs a cutter or cutters actuated by an engine worked by compressed air, which is so arranged that the cutter may have an independent forward motion imparted to it for a certain length without shifting the whole machine bodily from its original situation during the process of cutting.—Patent completed.

1922 W. STEVEN and A. ROBERTSON. IMPROVEMENTS IN BRICKMAKING MACHINES. Dated July 2, 1867.

This invention relates to machines of the kind described in a former patent, dated March 22, 1811 (No. 8857), and one of these improvements consists in dispensing with certain pistons or plungers employed in the machines constructed according to that invention. A cover of metal or wood is placed over each pug mill outlet, and is shaped so as to lead or guide the issuing clay down into the moulds or mould openings in the sliding frame. A second improvement consists in actuating the remaining pistons or plungers by means of weights in combination with levers, which levers have their movements regulated by cams shaped with depressions to allow of the descent of the weights at the proper times, and the inclined sides of which depressions re-elevate them by a positive action. A third improvement consists in introducing a yielding appliance in the driving arrangement, so that when from obstructions in the machine the resistance becomes injuriously increased, the parts will slip, and thereby save the gearing.—Patent abandoned.

1978 T. C. THOMAS. IMPROVEMENTS IN WATERCLOSET FITTINGS. Dated July 6, 1867.

This invention consists in so arranging the fittings that a regulated quantity of water may be discharged for flushing the basin every time the closet is used. This is effected by establishing at some convenient point above the level of the pan a small cistern or chamber with a tumbling trough which is always kept charged with the regulated quantity of water, and is filled from a reservoir above. The tumbling trough is filled from the supply pipe through a ball-cock which only admits a certain quantity; it is mounted on centre pins, so that when required it may be tipped over, in order to discharge the water. It is worked by gearing consisting of bands and pulleys connected to a lever, which may be actuated by a handle in the ordinary manner; or it may be connected to the door of the closet, so that it may be actuated whenever the door is open. The pan is provided with a syphon, and when the lever is pulled up or the door opened the tumbling trough will be pulled over on its axis, and the water will be discharged therefrom and allowed to rush down the exit pipe with considerable force into the pan.—Patent abandoned.

1980 J. CAPPER. IMPROVEMENTS IN THE CONSTRUCTION OF CHIMNEY TOPS. Dated July 8, 1867.

According to one modification of this invention the inventor makes that part of a chimney top which is attached to the upper termination of the chimney of a cylindrical form, and surrounding the higher part of it by another cylinder of larger diameter, so that an annular space is left between the two. Both of these cylinders are open at the top; the larger and outer one rises above the termination of the smaller one. A short distance below the larger cylinder, and attached to the smaller one, there is a projecting ring from which pieces rise and are attached to the outer cylinder, so as to leave alternately closed and open spaces. Wind enters at the latter, rises upwards in the annular space, and assists egress of the smoke.—Patent abandoned.

2018 J. E. WHITING. IMPROVEMENTS IN SUSPENSION BRIDGES AND OTHER STRUCTURES IN WHICH GIRDERS ARE EMPLOYED. Dated July 10, 1867.

This invention consists in connecting by a hinge, or other flexible joints, the ends of the upper chords of two diagonally braced girders, so that each girders may have its top chord always in tension; and these girders are constructed so that this may be the case, and they are inclined to one another at an angle properly chosen according to the proportions of the structure, and the requirements of the case, as to moving and fixed loads, and so as, the girders being free, to adapt themselves to changes of length consequent on changes of temperature and strain.—Patent completed.

2028 G. R. B. AMOTT. IMPROVED MACHINERY FOR MAKING BRICKS FOR BUILDING AND OTHER PURPOSES, AND OF COAL PEAT OR OTHER SUBSTANCES TO BE USED AS FUEL. Dated July 10, 1867.

This machine includes both a pugmill and a moulding apparatus. Mounted upon the bed of the machine is the pugmill, which is fitted with knives for working the clay, &c., and forcing it down towards the bottom of the mill. At the bottom of the pugmill cylinder openings are made to permit of two or more endless chains of moulds passing through the cylinder. These moulds are carried by tumblers or drums mounted in bearings at opposite ends of the machine, and they receive their transverse motion from the axle of one of the tumblers, which is driven by suitable gearing. As the moulds pass through the pugmill they are filled with the material to be compressed, the surplus of which is removed by the lip of the exit opening of the pugmill cylinder through which they pass. The filled moulds in passing along the bed severally come under the action of a compressing plunger and a discharging plunger, the former of which completes the moulding of the brick, &c., while the latter serves to discharge it from the mould on to a transverse travelling apron for delivering the bricks, &c., out of the machine.—Patent completed.

2029 A. H. BRANDON. IMPROVEMENTS IN WOOD-PLANING MACHINES. (A communication.) Dated July 10, 1867.

Here the inventor, according to one arrangement, places the timber to be planed on the table of a machine, and he advances it towards a rotating cutter by an upper feed roller turning in fixed bearings above the timber, and a lower feed roller let in the table immediately below the first, and beyond these rollers and above the timber he places transversely a cutter running at a high velocity, on either side of which, and parallel with the same, he also places guiding rollers to maintain the timber steady under the action of the cutter. In order that the feeding rollers may adapt themselves to any thickness of stuff to be passed through the machine; he terminates the under edges of the table in which the lower one runs in the shape of inclined planes, and by advancing and withdrawing horizontally two inclined planes on which the table rests he causes it to rise and fall vertically to the required extent.—Patent abandoned.

2030 A. H. BRANDON. AN IMPROVED CIRCULAR SAW MACHINE. (A communication.) Dated July 10, 1867.

This invention refers to a machine provided with two rotating circular saws, either of which can be brought to bear on the wood or other material to be operated upon. The patentee mounts each saw on the extremity of a shaft, and one of these shafts is mounted on bearings adapted to the extremities of two parallel levers, kept at a proper distance apart by a hollow sleeve shaft connecting them at their centre. The other shaft is mounted on bearings adapted to the other extremities of these levers. The sleeve shaft, with its levers, shafts, and saws, is mounted on a stationary shaft or bolt at such a distance below the table of the machine that the upper saw projects to the required extent. A small pulley is mounted on each of these saw shafts, so that the driving strap will always drive the upper one, whilst the lower one will remain stationary; thus, by rocking or turning this apparatus on the stationary shaft as its centre of motion, either one of the saws can be brought into work.—Patent completed.

2041 R. A. KENNEDY. IMPROVEMENTS IN DOORS AND WINDOWS, AND FASTENINGS FOR THE SAME. Dated July 12, 1867.

This invention is chiefly applicable to the windows generally known as "French windows," and it consists in making the sashes so that they can be raised on their hinges above the bottom bead forming part of the frame.—Patent abandoned.

2062 W. DRURY and C. WESTRUP. IMPROVEMENTS IN THE MEANS OF INDICATING NUMBERS AND NAMES ON DOORS OF PRIVATE HOUSES. Dated July 13, 1867.

Here the patentees cast the head of a street door knocker, which is usually of solid metal, with a round, oval, or other shaped opening, and in the back of this opening they insert a ground or other glass tablet, having thereon the number of the house inscribed. An aperture of similar form is also made through the door immediately behind the tablet in the knocker head. In this manner the number may be readily discerned on the transparent tablet from the street at all times, and especially at night, by the light of the hall or passage lamp, or from other source.—Patent completed.

Trade News.

TENDERS.

ALDERSHOT.—For sewering, paving, curbing, channelling, and other works, in Victoria road. Quantities supplied by Mr. W. Rowley, surveyor:—

Wainwright	£1860 16 6
Jeffries	1400 9 8
Benthall	1391 12 8
Martin	1372 4 2
Beevons	1333 6 4
Booth	1315 7 5

BATH STONE OF BEST QUALITY.

PROPERTY SALES.

Feb. 17

At the Mart.—By Mr. Dyer.—Leasehold residence, No. 1, Gloucester terrace, The Grove, Blackheath, annual value £1[illegible], term [illegible] years unexpired at £30 per annum—sold for £6[illegible].

Feb. 18.

At the Mart.—By Messrs. Debenham, Tewson, and Farmer.—Freehold tannery and premises, situate between Willow walk and Grimscott street, Bermondsey, occupying an area of about 47,[illegible] square feet—£6,000.

Freehold house, No. [illegible], Grimscott street, Bermondsey, also a large yard and workshops, occupying an area of about 6,000 square feet—£1,400.

Freehold residence, known as Highbury House, Selhurst-road, South Norwood—£1,700.

Leasehold house, No. 2, Lloyd square, Clerkenwell, let at £48 per annum, 49 years unexpired at £7 10s. per annum—£[illegible].

By Messrs. Glasier and Son.—Leasehold two residences, Nos. [illegible] and [illegible], Union row, Queen's road, Peckham, producing £[illegible] per annum, term [illegible] years unexpired at £19 10s. per annum—£675.

Freehold ground rent amounting to £150 per annum, arising from six houses and shops in Arundel place, Arundel square, Islington, and fifteen houses in Bride street, Liverpool road, Islington—£[illegible],400.

Feb. 19.

At the Mart.—By Messrs. Ventom, Clarke, and Bull.—Policy of assurance for £[illegible] in the Scottish Union Fire and Life Insurance Office, on the life of a gentleman in his 61st year—£1[illegible].

By Messrs. Norton, Trist, Watney, and Co.—Freehold corner plot of building land fronting New road, Carshalton—£[illegible]15.

Freehold plot of building land, situate as above—£235.

Freehold corner plot of building land fronting North street and New road aforesaid—£440.

Freehold building site known as White Bench field, situate overlooking Beddington Park, Surrey, and containing 2a. 1r. 20p.—£1[illegible].

Freehold building site, containing 5a. 2r. 20p., and known as the School House, Beddington, Surrey—£1,150.

Freehold, 1a. 1r. 24p. of building land, situate at Walton-on-the-hill, Surrey—£150.

Freehold [illegible]a. [illegible]r. 17p. of land, fronting the Epsom road, Surrey—£1,[illegible].

Freehold and copyhold farm, known as Mount Pleasant, situate four miles from East Grinstead, Sussex, comprising a residence, with farm buildings, and [illegible]a. 1r. 1[illegible]p. of arable pasture, and wood land—£2,[illegible].

Freehold three farms, known as Denman's, Swedes, and [illegible], in the parish of West Hoathly, Sussex, and farmhouses, buildings, and [illegible]a. 0r. [illegible]p. of arable, pasture, and wood land—£1,[illegible].

Freehold farm, known as Adgates, Cinder Hill, Horsted Keynes, Sussex, with house, buildings, and [illegible]a. [illegible]r. of pasture land—£1,[illegible].

Freehold [illegible] of arable pasture, and wood land, situate in the parish of Horsted Keynes—£[illegible].

Freehold [illegible]a. [illegible]r. 25p. of arable, pasture, and wood land, on the road leading from Lindfield to West Hoathly, Sussex—£1,[illegible].

Freehold farms, known as Hoathly Hill, and Newlands, with part of [illegible], situate close to the village of West Hoathly, with farmhouse, homestead, cottage and brick [illegible] buildings, &c., and [illegible]a. [illegible]r. [illegible]p. of arable, pasture, and wood land—£[illegible],[illegible].

Freehold farm known as Longridge, West Hoathly, with homestead, cottage, buildings, and [illegible]a. 1r. 12p. of arable, pasture, and wood land—£[illegible].

Freehold building known as the Police Station, West Hoathly—£[illegible].

Freehold [illegible] of building land, situate at West Hoathly—£[illegible].

Freehold 8a. [illegible]r. of arable land, situate at West Hoathly—£400.

Freehold estate known as Sharpthorn, West Hoathly, comprising a homestead with house, buildings, and 27a. 2r. 21p. of arable, pasture, and wood land—£1,[illegible].

Freehold farm known as Blacklands in the parish of East Grinstead, Sussex, with homestead, house, farm buildings, &c., also part of Nayland's farm, the whole containing 1[illegible]a. 2r. [illegible]p.—£[illegible],250.

Freehold farm known as Nayland's, East Grinstead, with farm house, buildings, and 56a. 1r. 31p. of arable, pasture, and wood land—£1,[illegible]20.

Freehold 7a. 3r. 12p. of meadow land, known as Bunch Grove Fields, situate at Bunch Grove, on the road from Horsted Keynes to Maresfield, Sussex—£2[illegible].

At the London Tavern.—By Messrs. Vigers.—Freehold plot of land, forming the corner of Denmark road, Camberwell—£2[illegible].

Freehold plot of land, fronting the Camberwell Station road—£600.

Freehold plot of land, fronting the Camberwell Station road—£310.

Freehold plot of land, fronting Wyndham road, Camberwell, and a lease for 1,000 years of two railway arches—£[illegible].

Freehold plot of land, fronting Crown street, Camberwell, and a lease for 1,000 years of a railway arch—£380.

Freehold plot of land, situate as above, and a lease for 1,000 years of a railway arch—£2[illegible]0.

Freehold house, No. 12, Olney street, Walworth road, let at £5 12s. per annum—£390.

Freehold plot of land fronting Sutherland square, South, Walworth road, and lease for 1,000 years of four railway arches—£1,320.

Freehold plot of land fronting Sutherland street, Walworth road, and a lease for 1,000 years of a railway arch—£[illegible]20.

Freehold plot of land, situate as above, and a lease for 1,000 years of a railway arch—£310.

Freehold house, No. 2, Carter street, Walworth road—£[illegible].

Freehold four houses and land, fronting Gravel lane and Paradise row, Southwark—£[illegible]10.

Freehold house, No. 12, Brixton place, Manor rise, Brixton—£620.

Freehold house in Shepherd's lane, Brixton—£330.

Freehold house, land, and buildings, fronting Nursery road, Park grove, Brixton—£960.

Freehold plot of land and buildings, in Stewart's-lane, Battersea Fields—£1,560.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

George Pottow Dyke, Greenham, timber dealer, March 4, at 2—William Augustus Hammon, London-street, Tottenham-court road, builder, March 5, at 2.—Thomas Keen, Stratford, builder, March 11, at 11—Robert Lipscomb Blomfield, Birchington, near Margate, church decorator, March 18, at 12.—John Cottell, South Norwood, painter, March 18, at 12.—Samuel Goslacre, Bromley, Kent, builder, March 9, at 12.—George Lapthorn, High street, Poplar, master joiner, March 18, at 11.—William Lintott, New Barnett, timber dealer, March 10, at 12.—William Parry, Hampstead, builder, March 9, at 12.—Richard Charles Rudman, Walmer road, Notting-hill, builder, March 18, at 12.

TO SURRENDER IN THE COUNTRY.

Thomas Scurr, Darlington, joiner, March 4, at 11.—William Smith, Hull, joiner, March 11, at 12—George Fawsett, Kyo, near Antield Plain, Durham, joiner, March 9, at 1. George Gale, Sherborne, builder, March 4, at 12. —Uriah Halsall Jones, Liverpool, builder, March 5, at 11. Anthony Rogers, Trevethin, Monmouthshire, contractor, March 9, at 11.—Henry Sharp, Burton, stonemason, March 9, at 1—Thomas Whetter, Truro, Cornwall, joiner, March 4, at 11.—Edwin John Wyles, Brighton, builder, March 9, at 11.—James Young, Goole, builder, March 9, at 11.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

March 16, F. Davy, St. Paul's-street, New-north-road, builder—March 16, W. Luxford, Myrtle-street, Dalston, builder—March 16, W. H. Soar, Vauxhall bridge road, plumber—March 18, W. THE BUILDING NEWS.

LONDON, FRIDAY, MARCH 6, 1868.

LEGISLATION UPON IMPROVED DWELLINGS.

AMONG the many important subjects pressing for Parliamentary consideration, the improvement of the humbler class of dwellings is certainly not the least. No amelioration of the condition of the masses can be real or permanent without an improvement of their squalid and unwholesome habitations. Health and strength are inestimable blessings to us all, but they form the entire capital of the poor; and, while no other dwelling-places are provided for them than the present overcrammed dens, where strength becomes palsied and health is hourly undermined, all other efforts for their benefit, whether political, social, or educational, are of very diminished value. We are, therefore, glad to perceive that Mr. Torrens is availing himself of the earliest opportunity to press forward his third bill on the subject. This perseverance does him infinite credit, and, though we consider his plan deficient, and in some respects even unwise, we are sure that its continued discussion will lead to the framing and adoption of some really practical and efficient measure at no distant date. In its main features the bill is the same as that of last year, and provides with respect to dwellings proved to be unfit for human habitation, that, if the present owners refuse to effect improvements themselves, they shall be compelled to sell them, at a valuation, to the local authorities, for the purpose of alteration or demolition, and the erection of improved dwellings on the site, the expenses of which are to be provided for by an addition of threepence in the pound to local taxation. Last year we pointed out, as a great objection to this proposal, that, so far from a compulsory sale (which always means a sale at a very high price) being regarded by sordid owners in the light of a penalty, it would practically operate as an inducement for them first to screw up the rents of their wretched tenements as high as possible, so as to enhance their nominal value, and then to permit them to fall into that state of neglect which should soonest compel the authorities to purchase them. The bill would thus defeat its own object, and offer a premium for the creation of the very evil it is intended to suppress. We perceive that criticisms of this nature have not been altogether unnoticed, and in the new bill a feeble attempt is made to meet the difficulty, by a proviso that, in assessing the amount of compensation, "allowance shall not be made in respect of the compulsory taking of the property." Now we very much doubt whether such a proviso will be permitted to pass the Committee. Holders of property will consider it a rather dangerous precedent; but, if it does, it will produce a very small effect indeed. The present race of weekly landlords, who wring heavy rents from poverty-stricken tenants, will not want for means of wringing a heavy price when compelled to sell their property. We are in principle opposed to compulsory sales at all, as will be seen, but, if the thing is to be done, we will offer a hint that it might be wise to take. Let the valuation be based upon the returns which have been made to the Income Tax Commissioners, for an average number of years past. In the case of weekly property, these returns are made, as a rule, by the landlords themselves. We should be sorry to suspect them unjustly, but it is within the bounds of possibility, that, when valuing their property for taxation, they have put rather a smaller figure upon it than if valuing it for purposes of sale. Be that as it may, they would have no right to complain, and the country ought not to be expected to admit a higher value when it has to pay money out of the exchequer than when it has to receive it. This we offer as a suggestion, though we should greatly prefer to see other means adopted. The man who draws from them an income of from 15 to 20 per cent., as the owners of the tumbledown tenements are said to do, is a trader upon immorality and disease, and the legislature should fix a stigma upon such a man, it should make him suffer in pocket, the most sensitive part of his nature, and, by a system of inspection, and fines if need be, should drive him to find it to his interest to make his places decent habitations, or to sell them at such a price as would permit others (themselves of course being subject to like control) to do so. A measure of this kind has had a wonderful effect upon the common lodging-houses of London, which now being bound to be regularly cleansed and subject to stringent regulations to prevent overcrowding, present an appearance contrary in every respect to the filth and squalor of some years back. We admit that from structural defects many places would be found incapable of improvement without utter demolition. In such cases, although we must hold that public authorities will always make bad builders and very objectionable landlords, we cannot object to compulsory acquisition by the authorities for the purpose of reconstruction.

It can hardly be said in most cases to be the present possessor's fault that the house was badly constructed at first, and he is entitled to reasonable remuneration. Nor can we object to the compulsory acquisition of property for the purpose of creating vacant spaces for air and ventilation. This is pre-eminently a work devolving upon the public, and cannot possibly be expected of private enterprise. The expenses being in the nature of capital laid out for the benefit of all future generations should be raised by loans and spread over a period of considerable length, otherwise we think the practical efficiency of the measure will be very much jeopardised. In small corporations the average municipal mind is not educated up to the point of acknowledging the paramount importance of sanitary measures, and if called upon to tax themselves too heavily for the purpose, such a consideration is likely to overbalance other motives, and the good work will be left undone. In fact, the proposal of an extra tax is likely to prove a rock upon which the entire measure will be wrecked, as regards the metropolis at least. Other proposals for improvements have had to be postponed on account of the fact that local taxation has reached its outside limit. We wish we could agree with the advocates of the bill, who aver that the rating power is taken merely as a reserve, and is not likely to be used. It is true, that properly conducted dwelling improvements will pay a fair percentage. But we have the awkward fact that the attempts of public bodies hitherto have not been well conducted, and we see no reason to suppose that they will be in the future. The well meant exertions of the City of London Corporation, and the recent failure of the Liverpool Corporation, are instances in point. The former acquired a site at Clerkenwell, at the price of £15,000, on which they have erected a pile of buildings at a further cost of £39,000, containing 168 separate tenements and 12 shops. Now, making every deduction for the value of these shops, it will appear that they have spent for every poor man's tenement, consisting only of two or three rooms, with a scullery attached, a sum which may be variously estimated from £250 to £280. These again are not occupied by the class of persons removed from wretched hovels, but by skilled artizans and others in the receipt of good wages, at rents varying from 4s. 6d. to 7s. 6d. per week; and at these rents the dividend is only 4 per cent. At Islington Cattle Market, also, they have spent £10,000 on the mere alteration of two large taverns into improved dwellings. These examples of corporate proceedings contrast very unfavourably with the action of private individuals and companies, or even of charitable associations, where the same work is usually done for at most about one-half of the cost, and the really poor are much more effectually housed. The Liverpool Corporation has, at present, according to all appearance, broken down in its attempt. Hampered by some inexplicable regulations, after having bought land, they rejected, first, the plan of their own officers, and afterwards all those sent in upon competition, and the last report is that the scheme is likely to be abandoned. Before casting the responsibility of fresh work upon such bodies, is it not true wisdom to inquire how they have hitherto accomplished work of the same nature, which they have voluntarily undertaken? If it be alleged that they are likely to perform the work well in future, some reason should be given for the expectation.

Our own view is, that the action of corporate bodies should not extend to the erection of buildings at all. The great practical obstacles at present to dwellings' improvement are—the difficulty of procuring sites in crowded neighbourhoods, owing to their high price, and the incorrect notion prevalent in the minds of capitalists that the investment is precarious and unremunerative. The former difficulty is increased by the present bill, which will enhance the value of land by taking it compulsorily, but might be obviated to a great extent by legislation framed with the view of rendering "bad" property burdensome to the present holders, while it remains in its present condition, a course which should compel them voluntarily to improve it themselves, or dispose of it at a fair price to others who will do so, which, failing, we conceive the law would have a right to step in and compel them to dispose of it—say, by public auction—under supervision of the authorities, subject to conditions of improvement and reconstruction on the part of the purchasers. Thus would a great number of eligible sites, for which dwelling reformers now search in vain, be thrown into the open market, and being sold subject to conditions for the erection only of improved dwellings, would be purchased at values to admit of that object. Again, the prejudice of capitalists against dwellings' improvement as an investment is likely to be increased by the working of the bill. Public bodies, as we have seen, always build extravagantly and pay the lowest possible dividend. What is most required is some examples on a sufficiently extensive scale showing that it will pay. This Alderman Sir S. Waterlow's company is doing; but the proposed corporate action would be set over against all their efforts, and the good effect they might have be most lamentably neutralised.

We think we need say little more to maintain that the action of the authorities should be limited to its proper sphere, which is not that of becoming house builders on a large scale, but of examining where improvement is necessary, and of using their powers to compel those who now derive profit from squalid wretchedness to effect such improvement themselves. No addition should be made to our fiscal burdens for the purpose of putting money into the pockets of landlords, or for expenditure on building jobs, but only for the unavoidable purpose of effecting clearances where no building of any kind should be allowed to stand. If the corporations are restricted to these departments only, we believe that a vast amount of capital which is now locked up would flow forth to effect a sorely needed social improvement.

IGNORANCE OF STYLE.—THE NEW WORKS, PALACE-YARD.

MR. E. M. BARRY, A.R.A., has done nothing to maintain the reputation of the architect of the Palace at Westminster by his last work—the piers and railings enclosing

Palace-yard. To anyone who knows something of the style in which the Palace is built, it must be a matter of surprise and regret that the present architect of the Palace should have learnt so very little even of the grammar of that style. According to all the evidence which the Messrs. Barry have advanced in the paper trial of Pugin v. Barry, the father of Mr. E. M. Barry must have been most intimately acquainted with all the details of the architecture commonly known as Perpendicular, or third Pointed, when the architect of the railings was in his long-clothes. It does indeed seem strange that, after years and years of apprenticeship to a master of one particular phase of Gothic art, the master should have been so cruel as not to have enlightened the pupil, or the pupil so obstinate as to refuse to be enlightened. A few months, a year at the furthest, would be time enough for any young man having eyes in his head to make himself master of the rudiments of our insular style, the Perpendicular. He would require no foreign travel, he would need but little home travel, for in almost every town he would find examples of this particular style. So that whether we accept Barry or Pugin as the art-architect of the Houses of Parliament, it is, we repeat, surprising that in our day, any man, principal or clerk, who had to work in harmony with such a building as the Palace of Westminster should make such a muddle of his subject and exhibit so much ignorance of the style to which he was necessarily committed. We can quite understand that Mr. E. M. Barry, like a number of his brethren, was never fond of the Gothic school of architecture, and, knowing what architects' offices are like, we can quite understand this even in the face of the evidence presented by the Endell-street Schools. It is possible too, that, even supposing Mr. Barry to be catholic enough to admire Gothic art as well as Classic work, he may yet have strong preferences, and hold, with Mr. Ruskin, that the later school of Gothic was "ignoble, uninventive and declining," and the earlier, "noble, inventive, and progressive." He may possibly have learnt almost to despise that kind of Gothic art in which his father seemed to him so proficient, and have narrowed his faith in Gothic to some very early phase of it. Still under no condition or conditions that we can think of is it possible to find an excuse. If Mr. Ruskin be right, the nation has accepted a building which some people think magnificent, "though there may not be from foundation to coping one ray of invention, or any other intellectual merit, in the whole mass of it." Still merit or no merit, declining or progressive, Mr. E. M. Barry was appointed its finishing architect, and might at least have taken the trouble to understand the nature of the work he was called upon to complete. That he does not understand it is plain to anyone who will take a walk round the railings of Palace-yard and note the details of the stone piers and the coarseness of the mouldings, their relation to one another, and all those things which indicate *style*. Of the general design, the intervals or spacing of the piers, the management of levels, the proportion of the mass of the pier, the outline of it, the curb, the gilding, and the lamps, we confess we are not at all enamoured; but for defects on these points excuse may be found. For the ignorance in detail there is no excuse. That a man should be unable to compose may be a shortcoming, but is not a blameable fault—that he should be unable to spell a single word or construct a single sentence grammatically are faults most blameworthy. It is very disheartening to us to write thus against the works of those who from their position may be assumed to be the art pioneers of the rising generation of architects. It is still more disheartening to us to find apathy and indifference so widespread, and mere personal considerations so strong, that so few care to take up the cause of art for its own sake. The individual shortcomings, or ignorance of Mr. Barry, are not much in themselves; the great danger at the present time is the very unwholesome influence such ignorance may possibly exercise on the future of many an unfledged architect. The letter of our correspondent "A. O. X." in our last impression should be taken well to heart by our younger readers. There is, without a doubt, a spirit of flippancy hovering over the young architects of the present day. They are too anxious to be heard, and not anxious enough to listen. A week or fortnight's trip on the Continent, a few hurried scratchy sketches, and a copy of Viollet-le-Duc, are considered by too many fit substitutes for the years of toil and study their elders have endured. This indifference to education, and this carelessness about the details of art, have been in a measure induced by the worldly success which appears to have fallen on men certainly not distinguished for their art knowledge. Young men see that the game of life is played sometimes successfully by fluking. They know that the right track involves hard uphill work, and to avoid this they take their chance with the flukes.

We are not crying "Wolf" without good cause, and Mr. E. M. Barry may be confident of this much, that it is not to hurt, or vex, or expose him that we have thus written, but rather to warn others, and especially our younger readers, that works showing ignorance of the grammar of art shall find no quarter in our columns.

A VISIT TO THE NEWARK PLASTER MINES.

NEWARK-UPON-TRENT, with its grim old feudal castle on the margin of the river, its quaint old timber houses, and its beautiful church, is a cherished spot to those versed in historic and legendary lore. Although in the midst of a district rich in objects dear to the antiquarian, we must pass on to the distant hills, where are situate the far-famed plaster mines. Upon ascending Beacon Hill, we turned aside into the works of the Newark Plaster Company, and, after hastily inspecting the various groups of men employed in selecting, dressing, baking, and grinding the plaster, we approached the face of a perpendicular cliff whose base is covered with vast heaps of débris. This "open working" has long been abandoned for the more economic mode of "mining." In a loosely stratified class of red marl this is not an easy matter, as the treacherous material above is rife with danger. The approach to the mine is by a descending tramway which leads to the lowest point of the old workings. Our guide, after penetrating the mine for a few yards, begged to return to the office, his ideas of safety being strongly in advance of remaining in such a dangerous place. Upon looking round at the numerous props, planks, and beams which were doing office in holding up the falling roofs, we could see ample cause for fears of personal safety. Being handed over to the foreman of the mine—a hardy fellow who has taken care of these underground works for five years—we commenced our dismal march. By the faint light of a candle suspended by a long wire swinging from the hand of our guide, we were able to form an opinion of the character of the workings. We were passing down a broad drift 10 or 15ft. wide, and from 6 to 8ft. high, with beautiful erratic veins of various coloured gypsum ornamenting its sides. Presently we had to step aside to allow a horse and wagon to pass; the boy in charge of the same, although provided with no better light than ourselves, pursued his dismal occupation with a joyous heart. We confess we were scarcely able to associate the popular air he was humming with the surrounding scene—conveying a load of crude gypsum along such a dreary road seemed the last thing in the world to inspire one to indulge in sounds of mirth and music. Admiring the wisdom of Providence which fits the back to the burthen, and makes light the heaviest load, we pursued our onward course. In the distance we could distinguish other lights. The atmosphere thus illuminated reminded us of a London fog. Our guide informed us that it was caused by the smoke from the powder used in blasting. The very idea of blasting in such a place evoked numerous fears. Upon nearing these lights, which were common candles stuck into pieces of clay, we were introduced to a class of workmen whose daily occupation is to dress the blocks of gypsum as they are brought away from the miners. Pursuing our journey we soon came to the end of the drift, where the miners were busily at work. There we were shown the system to which the mining of gypsum is reduced. The rock, which partly consists of layers of gypsum varying in shade from green and red to the purest white, is interstratified with consolidated red marl. Into this marl the miners bore horizontal holes for the insertion of blasts of powder, which, upon exploding, displaces the surrounding materials. A horizontal chase being thus formed, shots are placed in like manner in the material above and below, until the whole is cleared out except the lower stratum, which forms a step or raisement from the floor. This is a bed of solid gypsum, and is one of the best the miners pursue. Blocks of great size for architectural and other purposes may here be obtained. From being somewhat blue or variegated in colour the miners have given this vein the name of the "blue rock." The principle of these workings is to drive drifts of 15ft. in width to the extent of the boundary, leaving a wall of rock of the same thickness to separate them. This being done, cross drifts are cut, connecting them at regular distances. The mine is thus like an underground temple, set out in true parallelograms, its roofs being supported by innumerable pillars of massive strength. After the earth is thus honeycombed, the miners commence at the farthest extremities to work the area over again. This is done by sinking the floor 15 or 20ft., and, as the veins and beds of gypsum are extremely rich in the lower portion, this secondary operation is pursued at a trifling cost. These lower levels, save by the diminished ray of some distant lights, are lost in darkness, the penetration of which we found no easy matter. After climbing over tons of gypsum which had been raised from these lower workings, we passed along a series of narrow inclined planks, upon which men, who can accommodate themselves to lead a life in such an atmosphere, wheel heavy loads of stone. We are often surprised at the ease with which our labouring men wheel heavy loads along these narrow planks, but to pursue this feat in darkness is a work of no ordinary peril; yet such is the ease with which difficulties are overcome by practice, that these miners can pursue their calling with no other protection from falling into the abyss of darkness below than a candle fixed in front of their barrows.

Being landed at the lowest levels of the mine we are introduced to its grandest features. The pillars have so risen in importance that the roof which they support is lost in the darkness overhead. The lower beds of gypsum which now present themselves are of pearly whiteness, the lowest being of the greatest value and thickness. This is mined for artistic work, and to be manufactured into the finest plaster of Paris, and of late years a great trade has been carried on with this class of stone, in being ground up in an uncalcined state for "terra alba." This powder is used in enamelling paper, and in the preparation of calico and other textile fabrics. It is also largely used in confectionery and in the adulteration of food, the principal market for this purpose being on the Continent. Whether it returns again to this country, and is consumed as a condiment in our food and spices, we will not stop to inquire; certain it is that a large trade is done in this calcareous powder. Returning to the material itself, we find the men busily engaged

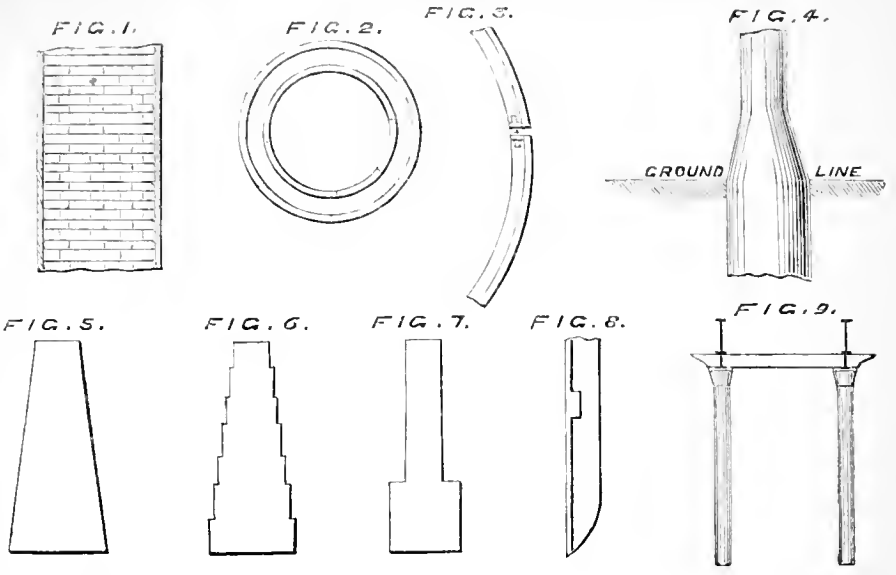
in drilling blast holes in this valuable bed of gypsum, extracting the white powder from the drill holes, or charging them with shot for blasting. From this point we were led through a perfect network of passages to examine the various sections, some of which were truly beautiful. Those which were newly cut, and had not been discoloured by the damp and smoke, reflected with their myriads of amorphous and nedular crystals our lights a thousandfold. Forgetting for a moment the position we were placed in, and being away from the noise of the miners, we were induced to question our guide, in the hope that such a great worker of geological sections in the upper series of the new red sandstone system might be in possession of that long sought philosopher's stone, "a fossil from the gypseous marls." Whilst waiting his reply we suddenly reeled, our breath became suspended, and, half unconscious with a sense of internal displacement, we hoarsely exclaimed, "Has the mine fallen in upon us? What was that terrible shock which shook the very earth?" "That, sir," said our guide, "is a blast;" he quietly continued, swinging the candle in his hand, "it is not so bad as some—we have every candle in the mine blown out at times by the concussion of the air." Before we had retraced our steps many yards, another and still another blast overtook us, and with mingled fears for our safety and our senses—which had never been so severely tested—we pursued our way to the mouth of this dismal mine. With dilated eyes we regained the light, and, after breathing the fresh air which is so sweet on the hills of Nottinghamshire, we left the Newark plaster mines, having the inward satisfaction that those amongst the curious who wished to explore them could do so without our envy.

ELEMENTS OF ENGINEERING.

CYLINDERS.

IN all examples of construction, the inherent strength of the whole design is due, either to the individual strength of a number of comparatively small component parts, intimately and rigidly connected to one another, or in that of a few massive constituents, serving to compose the fabric. The greater the number of parts, or the smaller their dimensions, the greater the necessity for solidity and firmly completing their connection. As a case in point, let us select a solid pier of masonry, and compare it with one similar in form and size, constructed of screw piles, in the manner described in our last article on "Elements of Engineering." When once the pier of masonry has been erected, it resists all attempts to disturb its equilibrium, as much, if not more, by its own insistent weight, as by any additional strength it may derive from the value of the cementing material between its component parts. It is otherwise with an assemblage of screw piles, which we have previously shown must be strutted, braced, and tied in almost every conceivable direction, to maintain them in that position which alone can guarantee their uprightness and safety. If once a pile gets out of the plumb, the cause originating its deviation from the perpendicular being still at work, its ultimate fall is only a question of time, and of the durability of the bracing. In truth, the thin film of cement put between the joints of two large stones, weighing, as many of them do in the present Thames Embankment and Blackfriars Bridge works, four or five tons, is completely a superfluous operation. Any force that would move the stones themselves, would speedily detach the cement. The case is very different where brickwork is concerned. In the first place, brick is a more porous substance; and, secondly, the quantity of the cementing material employed for each stone—regarding each brick as a small stone—bears a large proportion to that of the parts to be cemented together. Taking the ordinary mortar joint at an eighth of an inch, the proportion between the solid contents of a brick and the surrounding mortar will be about six to one. When bricks are not the material constituting the structure, but large stones are used instead, the proportion becomes almost infinitely great, as the mortar increases simply as the square, the thickness of the joints being constant, while the stones increase as the cube. Apologising for this digression, we now return to the more immediate purport of our article.

ELEMENTS OF ENGINEERING.—CYLINDERS.



As screw piles present peculiar advantages in certain localities, which counterbalance the complexity of their arrangement, and the element of weakness always attached to designs composed of a multitude of small subordinate parts, so do cylinders afford a freedom from many of the disadvantages possessed by the other means of laying foundations under water. These latter do not attain to the solidity and imposing massiveness of the solid pier, yet they have more inherent strength, owing to their increased dimensions, than the screw piles. The real difference is mainly one of degree and not of kind, if we except the absence of the screw flange upon the lowest length of the pile. There is, however, a very important difference to be observed in the duties demanded of piles and of cylinders. Piles act as the *bonâ fide* support of the superstructure; while cylinders, after serving the purpose of laying a solid foundation under water, may be regarded more in the light of a casing or protection to the concrete, masonry, or brickwork contained within them, than as sustaining the weight of the bridge resting upon them. A vertical section taken through one of the cylinders of the Charing-cross or Cannon-street bridges would represent the appearance shown in fig. 1. The real utility in the employment of the cylinder system is the facility it affords, as a perfectly watertight cofferdam, of building up a pier of solid material under water, with nearly as much rapidity and safety as the operation could be carried out upon dry land. The diameter is seldom less than six feet, as a smaller dimension would interfere with the working of the men inside, and the prosecution of the undertaking. Moreover, as the contents are ultimately intended to support the superstructure, it would scarcely be judicious to employ a pier with a less minimum breadth. There is also but very little extra difficulty and expense incurred in sinking a cylinder exceeding another by merely a foot or two in diameter. All the tackle and temporary plant required in the one instance would be equally necessary in the other, and the mere cost of the material would be too trifling a consideration to be allowed to interfere with the result. The shape usually chosen for cast iron cylinders in plan is round, although at first sight it would appear as if they should be of the same form as an ordinary pier, that is, rectangular in the centre portion, and either pointed or curved to an angle at the extremities. When, however, it is kept in view how small their dimensions are in comparison with a solid pier running the whole breadth of the bridge, it is manifest that the circular form offers scarcely any appreciable difference in resistance to the flow of the water. There is, besides, a very forcible objection to employing cast iron plates with a sharp angle in the position of a cutwater of a pier, as, from the brittleness of the material, a blow from any heavy body floating in the stream would certainly fracture it. The cylinders encasing the piers of the Charing-cross and Cannon-street railway bridges are circular in plan, and those of the former have different diameters, according to their height above foundations. From the bottom up to the level of the ground they are fourteen feet in diameter, and from that level to the cross girders over head they are ten feet. Their plan, viewed from above, is shown in fig. 2; and they are composed of segments cast with horizontal vertical flanges upon them, both for the purposes of strength and also to allow of each segment to be bolted to its neighbours. A peculiarity in the joint is that the separate segments do not touch one another, but a small space is left, as shown in fig. 3, which is filled with iron cement, through which the connecting bolts pass To ensure an accurate close fit the joints of the segments are all planed and faced. It will be seen, on referring to fig. 3, that the flanges are cast upon the inside of the segments, which not only, similarly to screw piles, is indispensable to those lengths penetrating the substratum, but also enables the bolting up of the separate segments to be accomplished with greater facility and convenience. Where the dimensions of the cylinder, as in the case of a small screw pile, are contracted, it is less laborious to bolt up the different lengths from the outside, as the workman has abundance of room, and is not hampered in the use of his tools.

At the ground line, as represented in fig. 4, the part of the cylinder in the structure already alluded to having a diameter of fourteen feet, slopes up at an angle to that of ten feet in diameter above ground.* Generally, when there is a difference in the diameter or

* As we are dealing with the subject generally, we have selected the cylinders of the Charing-cross Bridge merely as an example, and not as a pattern or model. The reader will find a full description of the whole of this bridge in a paper read before the Institution of Civil Engineers by Mr. Hayter.

dimensions at the top or bottom of any pier, whether solid or hollow, the two inequalities may be united or reconciled in one of several methods. The most usual is that of an uniform batter, especially when applied to brickwork or masonry (see fig. 5); and there would be not the slightest difficulty in employing this principle in the construction of cylindrical iron casing piers. The wrought iron pillars carrying the roof and galleries of the Exposition Universelle were made of this form, although their horizontal section was rectangular instead of circular. An increase towards the base may also be obtained, as shown in fig. 6, which presents a very elegant appearance to the eye, or the difference may be surmounted by a single offset at right angles, where it is judged advisable to enlarge the dimensions of the structure. In the case of cylinders exposed to the action of tidal waters, the increase by either one or successive offsets would be a less preferable plan of augmenting the size compared to that in fig. 5 or fig. 4. Owing to the quantity of detritus and solid matter contained in the stream, those portions of the cylinders below high water mark, if formed in this manner, would constitute small receptacles for the deposit of foreign substances, and at low water present a very unsightly appearance. Strictly speaking, the junction of the two dissimilar segments, represented in fig. 4, is identical with that shown in fig. 7, except that the offset is bevelled off at a very flat angle. The vertical ribs cast upon the interior of the bottom segments are tapered off (see fig. 8) to allow of the free penetration of the cylinder into the bed of the river or sea, and also to prevent any chipping of the edges taking place. It is difficult to lay down any rule or the proportion of thickness to be observed in the castings, but the limits may be taken as lying between one inch and one inch and a half. In bolting the various segments together, the joints, where possible, should always alternate—that is, the different lengths should break joints with one another. This was not done in the Charing-cross Bridge cylinders, and it was alleged that by not complying with this usual detail the horizontal joints fitted better. It is probable the case was so, but it is not sufficient to form a precedent, nor do we acknowledge the validity or force of the argument in any degree. The absence of all bracing and strutting is a feature favourable to the employment of the cylinder system, and draws a broad line of distinction between that system and the adoption of screw piles. The only bracing that cylinders require is a strong connection at top, which is easily and most advantageously effected by the cross beam necessary to support the roadway, supposing the main guides to rest immediately over the longitudinal axes of the cylinders. This arrangement is represented in fig. 9, and is that evidently presenting itself as the one most suitable for adoption whenever it can be applied with propriety. Care, however, should be taken in bedding the girders that they should not actually rest upon the edges of the cast iron casing. All danger of this occurring can be readily obviated by carrying up the internal pier an inch or so above the outer casing, which is best accomplished by capping the pier with a massive granite or limestone block capable of bearing any weight short of what would crush the material. Having completed a description of the cylinder principle, the next step is to consider the means of sinking them. There are several different systems in use, but, as these are all equally applicable to the sinking of caissons—another description of subaqueous foundations—we shall reserve an account of them until we have touched upon the latter method of laying the foundations of piers, harbour-walls, and other examples of engineering construction. This we propose to do in our next article relating to "The Elements of Engineering."

GOSSIP FROM GLASGOW.

(From our Correspondent.)

Whether men are to be made moral, good, and wise by Act of Parliament—by Household Suffrage, Technical Education, or Permissive Beer Bills—or not, meanwhile crime creeps apace with our so-called civilization, and accordingly Glasgow is crying out for more of court-room in which to administer justice, and gaol-room in which to punish. The additional court accommodation is to be attained by a conversion of the present "County Buildings" in Wilson-street, and the erection of new towards Ingram-street; also by altering, in the Old Gaol at foot of Saltmarket, the Small Debt Sheriff Court into rooms for witnesses. It will be necessary to apply to Parliament for power to raise the requisite ways and means for this extension of courthouse accommodation, and the standing orders require the preparation of an explanatory block-plan; but the Commissioners have instead had plans made out in detail and estimated, the cost being £36,000 for the alteration and addition in Wilson and Ingram-streets, and £4,000 for the alteration at foot of Saltmarket. No street in Glasgow is already richer in public buildings than is Ingram-street, and the new façade of the courthouses will be a most important addition, although, unfortunately, it will have to face the north. It is well that the alteration of the Old Gaol will not affect the exterior—a remarkably fine elevation in Greek by Stark, albeit without the platform on which his excellent judgment originally designed it. The prison extension will assume the form of an addition or additions to the present Bridewell in Duke-street at a cost of about £50,000. If the style of architecture of the present building be carried out, I fear that an undue punishment will be imposed upon such poor prisoners as have any feeling for the Fine Arts.

The insurance companies are following the banks in the erection of palatial offices. The Scottish Widows' Fund and Life Insurance Society have, with this view, just purchased a very large property in a commanding situation, the corner of Renfield and West George-streets. Although at present covered with substantial buildings, about their demolition there will be little hesitation, as lately a public edifice in their immediate neighbourhood was pulled down before that it had either shown any decay or known a second decade.

Although such mere materialism as a slated and fenestrated big box of stone, timber, and cast iron might be occasionally removed, one's idea of the peculiar status of a statue is the *statu quo*. In Glasgow we exercise an extraordinary amount of deliberation in choosing sites for our statues; but, after all, we surely either choose not well, or else are foolish enough not to let well alone. The Queen's Statue, erected only a few years ago in St. Vincent-place, has been lately erected over again in George-square, and the other day the Town Council resolved that the statue of Sir John Moore be removed to make way for that of Lord Clyde. Of course the public have been addressed on the subject in "letters to the editor," from "A Constant Reader" and "A Peninsular Veteran." Hierocles speaks of a brick as a specimen of a house; and Glasgow has just received a specimen of the Clyde Statue in the form of a bust, which has been kindly sent by Mr. Foley to our "Portrait Exhibition." There have been exhibited in Glasgow, also, busts of Lord Clyde by Adams and Ewing.

Competitions are a *questio vexata* here as well as in London. In my last I mentioned that the United Presbyterians, in asking designs for a church, bound the competitors over to merely Greek or Gothic, but the Reformed Presbyterians have shown themselves even more knowing. Ever since the so-called "National" Wallace Monument Competition, when, notwithstanding that competitors were strictly limited to "India-ink," one boldly ventured upon colour, and was accepted, competitions have had anything but a sweet-smelling savour about them. The Reformed Presbyterians have guarded themselves in a most effectual way against such malpractices by—well, what do you think?—issuing the paper on which the elevations are to be drawn, a paper that, even if made expressly for the purpose, could not have better served it. It is whispered in "circles likely to be well informed" that the committee will be aided in its decision by a professional assessor, so, if "justice" be not given for once, it at least seems as if intended. But the committee must needs know that long ago a patent was taken out for using up even the best intentions into Tartarian pavement.

We have had another visit from Mr. Bazalgette and Mr. Bateman anent the sewage question. As now nothing of a public nature can be done without that noun of multitude conveying plurality of idea, Mr. Demos getting his hand in, a "sewage association" has been formed, in which essays are periodically read on the most economical means of removing and utilizing the city *excreta*. As, according to Dogberry, "comparisons are odorous," I am happily spared the unpleasantness of pronouncing upon one or other of the schemes set forth by members of the association; and, notwithstanding that in a multitude of counsellors there is wisdom, I ask to be excused if I put my trust in an individual engineer, who, like Bazalgette, has reported upon plans for the improved drainage of such towns as Belfast, Folkestone, Dublin, Brussels, Oxford, Norwich, Cambridge, Cheltenham, and Saint Leonard's. To Bateman we are greatly indebted for furnishing us with an exhaustless supply of pure water, and, if he be as successful in ridding us of the foul, our gratitude will be none the less.

The same day that the Town Council resolved upon the removal of the statue of Sir John Moore, a plan for providing accommodation in the Corporation Property, Sauchiehall-street, the building in which are the several art galleries, for the School of Art, the Philosophical Society, and the Institute of Engineers, was exhibited and considered. The plan embraces also retiring rooms in connection with the upper galleries for the use of the corporation, and a hall about forty feet by thirty for a museum for inventions, models of machinery, &c. The School of Art is, I believe, prepared to enter into a lease for twenty years at £300 per annum, and the Philosophical Society and the Institute of Engineers conjointly into a long lease at £200 per annum. The Galleries sub-committee expressed its opinion that having such establishments under one roof would tend to promote the interests of art and technical education in the city, and that the return to be secured is sufficient to justify the proposed expenditure.

All building business is unusually dull. There is little doing in even speculative enterprise, notwithstanding that of late the rent of almost all classes of houses have been considerably raised.

PLUMBERS' WORK.

A paper on this subject was recently read before the Architectural Association by Mr. J. A. Bunker. Dividing his subject into three sections—Historical, Chemical, and Practical—he referred, first, to the great antiquity, importance, and wide diffusion of the metal lead. He then gave the results of various experiments that have been made with a view to determine the exact action of water on lead pipes. Passing to the practical part of his subject Mr. Bunker said a plumber who really understood his business should be able to cast lead into sheets even as thin as 4lb. to the foot superficial. In casting sheet lead, a copper is provided, well fixed in masonry at the upper end of the workshop, near the mould or casting table, which consists of strong deal boards well jointed together, and bound with bar iron at the ends. The sides of this table, of which the shape is a parallelogram, varying in size from 4 to 6ft. in width, and from 16 to 18ft. and upwards in length, are guarded by a frame or edging of wood 3in. thick, and 4 or 5in. higher than the interior surface, called the shafts. The table is fixed upon firm legs, strongly framed together, about 6 or 7in. lower than the top of the copper. At the upper end of the mould nearest the copper a box called the pan is adapted in its length to the breadth of the table, having at its bottom a long horizontal slit from which the heated metal is to issue after it has been poured in from the copper. This box moves upon rollers along the surface of the rim of the table, and is put in motion by means of ropes and pulleys fixed to beams above. While the metal is melting, the surface of the mould or table is prepared by covering it with a stratum of dry and clean sand regularly smoothed over with a kind of rake, called a strike, which consists of a board about 5in. broad, and rather longer than the inside of the mould, so that its ends, which are notched about 2in. deep, may ride upon the shafts; this being pressed down the whole of the table reduces the sand to a uniform surface. When this is done, the pan is brought to the head

of the table close to the copper, its sides being guarded by a coat of moistened sand to prevent its firing from the heat of the metal, which is emptied in with ladles from the copper. These pans or boxes are made as to their contents equal to the quantity of lead required to cast a whole sheet at one time, and the slit is so adjusted as to let out during its progress along the table just as much as will completely cover it of the thickness and weight per foot required. Everything being thus prepared, the slit is opened, and the box is moved along the table, dispersing its contents from the top to the bottom, and leaving in its progress a sheet of lead of the desired thickness. From this description it will be understood how the old lead cisterns, fast disappearing, were cast. The pattern required for the front and ends would be impressed in the sand, and when cast the sheet of lead would thus be ornamented, and being bent at certain points at right angles the cistern would be formed. The great objection to cast lead is that it frequently happens in casting that small air holes are left through which water will of course find its way. This difficulty is overcome by milling the lead. Milled lead being now nearly always used, all students should acquire by experience the power of testing, with the aid of the thumb and finger only, the several weights of milled lead, and, as a rule, not believe too readily in heavy 4lb. lead when it ought to be 5lb.

In using milled lead for gutters, flats, and flashing, let the leading principle be that of giving the metal as much liberty as possible to expand and contract as it may be necessary according to the variations of the temperature: this is done by dividing flats into narrow strips by using rolls which should not be more than 2-6 apart. Gutters should not be more than 10ft. long without having drips or rolls as may be necessary. In ordinary gutters the lead should always be at least 9in. under slates, and 6in. against vertical walls, and be properly flashed. The flashes should be well wedged and pointed to brickwork and burnt into stonework. This latter plan is not done so often as it should be; a groove or chase is cut into the stone, the edge of the flashing is then inserted, a length of clay, properly prepared, is attached, and molten metal poured in in such a way as to make the edge of the flashing and the metal poured in one solid mass.

Lead pipes used for conveying water to and from cisterns, sinks, &c., are jointed together with solder, either by wiped or blown joints. The former is the older method, and consists of opening one end of the pipe in order to receive the end of the length of the pipe to be joined with it, which end has been previously shaved; the two ends being brought together and secured in a steady position, the molten metal, as contained in a small ladle, is taken in the one hand, and the wiper in the other—metal is poured on the joint and wiped round until the bulb join, so well known, is obtained; these joints are generally finished off with a hot iron, but an experienced plumber would be able to wipe a joint and finish it off without its use. It is of great importance in these joints that the molten metal should be used at a certain degree of heat, such as can only be ascertained by experience. Where this experience is wanting it is generally sought to conceal that fact by the use of the iron and tallow, the object being to leave the solder such a colour that to an experienced eye it may appear to denote a joint made with metal at the right heat and wiped and finished without an iron. Blown joints are formed, as may be inferred from their name, with the aid of the blow pipe; these joints are not so neat in appearance as the wiped joints, but many believe they are much stronger, because, by the aid of the blow pipe, the molten solder is brought into contact with the ends of the pipes, and the whole formed into a more solid and compact joint than can be done by merely pouring over the liquid metal on ends of pipes that must chill it, and thus, unless great care is used, form but an imperfect joint.

From experience of the serious consequences of taking waste pipes of cisterns into D-traps, soil pipes, &c., he advised that in all cases these pipes should be carried into rain-water pipes, external gutters, or into internal sinks, indeed anywhere but where they will become as ventilating shafts to the soil or drain pipes. He suggested the more extensive use of air pipes from D-traps and soil pipes; they might be carried into chimney shafts, or otherwise disposed of, and at a very small expense would greatly assist in keeping houses free from noxious smells. He trusted that the subject would receive increased attention from architects, and earnestly advised them never to be careless over the specification for plumbers' work.

REMARKABLE MECHANICAL INVENTION.

A NEW JERSEY (United States) paper tells the following story:—Mr. Zaddock Deddrick, a Newark machinist, has invented a man; one that, moved by steam, will perform some of the most important functions of humanity; that will, standing upright, walk or run, as he is bid, in any direction, and at almost any rate of speed, drawing after him a load whose weight would tax the strength of three stout draught horses. Six years ago the inventor conceived the novel idea of constructing a man that should receive its vitality from a perpetual motion machine. The idea was based on the well-known mechanical principle, that if a heavy weight be placed at the top of an upright slightly inclined from the vertical, gravitation will tend to produce a horizontal as well as vertical motion. The project was not successful. However, by observing carefully the cause of failure, persevering and perfecting the man-form, and by substituting steam in place of the perpetual motion machine, the present success was attained. The man stands 7ft. 9in. high, the other dimensions of the body being correctly proportioned, making him a second Daniel Lambert, by which name he is facetiously spoken of among the workmen. He weighs five hundred pounds. Steam is generated in the body or trunk, which is nothing but a three horse power engine, like those used in our steam fire engines. The legs which support it are complicated and wonderful. The steps are taken very naturally and quite easily. As the body is thrown forward upon the advanced foot the other is lifted from the ground by a spring and thrown forward by the steam. Each step or pace advances the body two feet, and every revolution of the engine produces four paces. As the engine is capable of making more than a thousand revolutions a minute, it would get over the ground, on this calculation, at the rate of a little more than a mile a minute. As this would be working the legs faster than would be safe on uneven ground or on Broad-street cobble stones, it is proposed to run the engine at the rate of five hundred revolutions per minute, which would walk the man at the modest speed of half a mile a minute.

The fellow is attached to a common Rockaway carriage, the shafts of which serve to support him in a vertical position. These shafts are two bars of iron, fastened in the usual manner to the front of the carriage, and are curved so as to be joined to a circular sustaining bar, which passes around the waist, like a girth, and in which the man moves so as to face in any direction. Besides these motions, machinery has been arranged by which the figure can be thrown backward or forward from a vertical position nearly forty-five degrees. This is done in order to enable it to ascend or descend all grades. To the soles of the feet spikes or corks are fixed which effectually prevent slipping. The whole affair is so firmly sustained by the shafts, and has so excellent a foothold, that two men are unable to push it over or in any way throw it down. In order to enable it to stop quickly, it is provided with two appliances, one of which will, as before stated, throw it backward from the vertical, while the other bends the knees in a direction opposite to the natural position. An upright post, which is arranged in front of the dashboard, and within easy reach of the front seats, sustains two miniature pilot wheels, by the turning of which these various motions and evolutions are directed. A sufficiently large amount of coal can be stowed away under the back seat of the carriage to work the engine for a day, and enough water in a tank under the front seat to last half a day. In order to prevent the "giant" from frightening horses by its wonderful appearance Mr. Deddrick intends to clothe it and give it as nearly as possible a likeness to the rest of humanity. The boiler and such parts as are necessarily heated will be encased in felt or woollen under-garments. Pantaloons, coat, and vest, of the latest styles, are provided. Whenever the fires need coaling, which is every two or three hours, the driver stops the machine, descends from his seat, unbuttons "Daniel's" vest, opens a door, shovels in the fuel, buttons up the vest, and drives on. On the back between the shoulders the steam cocks and gauges are placed. As these would cause the coat to set awkwardly a knapsack has been provided that completely covers them. A blanket neatly rolled up and placed on top of the knapsack perfects the delusion. The face is moulded into a cheerful countenance of white enamel, which contrasts well with the dark hair and moustache. A sheet-iron hat with a gauge top acts as a smoke stack. The cost of this "first man" is 2,000 dol., though the makers, Messrs. Deddrick and Grass, expect to manufacture succeeding ones, warranted to run a year without repairs, for 500 dol. The same parties expect to construct, on the same principle, horses which will do the duty of ten or twelve ordinary animals of the same species. These, it is confidently believed, can be used alike before carriages, street cars, and ploughs. The man now constructed can make his way without difficulty over any irregular surface whose ruts and stones are not more than nine inches below or above the level of the road.

RUNNING-UP HOUSES.

DR. LANKESTER, the coroner, last week held an inquest at the Torrington Arms, Finchley, on the body of George Moore, who was killed by the falling of a portion of a building, on which he was working. The case only furnishes another lamentable instance of the extraordinary way in which houses are "run-up" in London, and we need scarcely say that it reflects the greatest discredit on those who can be found to execute such work. The evidence showed that the house in question was intended for a public-house, and an effort was being made to get it finished in time for the forthcoming licensing day. In order to obtain large cellarage room the stacks of chimneys were not carried down to the ground, but built upon the party wall, which was 28ft. long and 9in. thick. As soon as the centring was removed the wall and chimneys fell, burying the deceased and suffocating him. Mr. Richard Wale, an architect, who was examined, said that no architect could have designed and no competent builder have erected a building on the plan of the one which fell. It could not possibly have stood. If it had been propped up for twelve months and the support then removed it must have fallen. The dead weight upon the structure was altogether too great for its capacity. If the chimneys had been carried down to the ground the wall would have stood. He had been in his profession for thirty years, and had never seen a building on such a plan before. Henry Moule Thomas, a carpenter and joiner, living in Finchley, admitted that he prepared the plans and specifications for the construction of the building for a Mr. Denton but with respect to the chimneys he merely suggested the way they should be put up, and left it open for Mr. Denton to decide. He thought the wall was strong enough to bear the weight, and considered that the accident had been caused by the contraction and expansion consequent upon alternate cold and warmth. He had certified that the work was carried out properly so that the builder might get his money. The jury, after returning a verdict of "accidental death," passed a resolution attaching blame to the owner of the house for not obtaining competent assistance, and extending the censure to all the principals, but they subsequently differed about the exact terms to be employed, some thinking the resolution as worded by the foreman not strong enough, and others thinking it too strong. Ultimately the coroner and six jurors signed the following resolution:—"The jury empanelled at the Torrington Arms, Finchley, on the 27th day of February, 1868, on view of the body of George Moore, having returned a verdict of 'accidental death,' are of opinion that sufficient care was not taken by the owner of the building in which the deceased met his death, to secure efficient assistance in the planning and construction of the said building, and the said jury are also of opinion that the said owner and his advisers and assistants are culpable for the deficient arrangements by which the said deceased met his death."

Four companies share the work of cleaning the streets of Paris, the contracts for it being obtained on sealed tender. The persons employed are divided into street sweepers of the first and second classes, with auxiliaries, men and women. The total number in the service is about 6,000. This little army of labourers is paid, not by the day, but by the hour. The sweepers of the first class receive 38 centimes, and those of the second 29; the male auxiliaries, 25; and the female, 20. As the work is ten hours daily, summer as well as winter, the wages of the men amount to 2f. 50c., and the women to 2f. Nearly all these labourers, of both sexes, come from Alsace, Rhenish Prussia, the Grand Duchy of Baden, and Luxemberg, but chiefly from the latter.

FRET CUTTING AND PERFORATED CARVING.*

In noticing this book on Fret Cutting and Perforated Carving, we can recommend it as containing many valuable practical hints for the amateur, and a number of good and useful designs for fret cutting. The book is elegantly got up with illustrations and descriptions of tools necessary for the use of the learner. It possesses, however, many defects, some of which we will point out. The designs, fifty-three in number, are appropriate, and, considering their effectiveness, are not difficult to work out, and, being applicable to articles of utility, the professional fret cutter will find them serviceable. Should, however, the amateur attempt to execute them according to the instructions given, we are afraid he will be disappointed. The mode of working, although apparently simple, is exceedingly difficult, and, should the amateur by perseverance overcome all the difficulties, he may have the mortification of learning that much better work can be produced by an easier and simpler method in much less time. Why should the amateur adopt the most primitive and difficult method, when, by the outlay of a few pounds, he can purchase a machine which will enable him to do his work with ease and satisfaction? Fret work is now extensively used in commerce, simply because it can be produced, by the aid of the fret cutting machine, cheaper and better than by the old methods. These machines are worked in the following manner. The work is held and guided by both hands on the table of the machine; the saw works up and down by means of a treadle similar to a sewing machine. In the absence of a machine there is another method commonly used, which is preferable in many respects to the one recommended by the author. It is a kind of wooden vice (called a donkey), which holds the work steady. The fret cutter guides his work with one hand, and saws with the other. His position is easy, his work is straight before him, and he has more command over it. This vice may be either screwed to the bench, or stand independently. The drilling tools and saws recommended in the work are the proper ones, but, when several pieces are to be worked together, the manner of fastening them by means of glue and paper is not so good as tacking them together with French brads in the margin of the work, as it saves the trouble of removing the paper. A piece of fine glass paper should be held firmly on a flat cork, and lightly rubbed over the rough side of the work; it removes the burr produced by the saw, and gives the work a sharp appearance. Fret cutting is purely a mechanical process—we may say it is the preparation of the wood for the carver, or, at the most, it is only a thing half expressed, and requires the aid of the carver to give it full form and expression. The author of the book seems to acknowledge this, and gives a few practical instructions to guide the amateur in this method of proceeding. The carving tools recommended should be taken rather as a sample of what is required than a complete set. The pupil is told to cut away a portion of the leaves so as to lay them in a natural and graceful position, and then to carve in the stems and veins. Again we must say the amateur is in a fair way of being disappointed unless he first obtains the assistance of a practical carver to instruct him in the way of holding the tools, and show him the peculiarity of the grain of different woods, and, above all, in the manner of producing certain effects in the wood, as a substitute for the forms of natural details. Should the amateur attempt to copy Nature exactly, he will find he labours in vain. The nature of the material is such that it will not allow of so fine a manipulation. The experienced carver has learnt to produce effects in carving which are, after all, only a substitute for natural forms. The pupil having been rightly instructed in the use of the tools, with the exercise of a little patience and practice he will soon master the mechanical part of carving, and then his artistic powers will be brought into play. Then, in fact, it is that carving becomes truly an agreeable and delightful amusement. The fact that so many of our best carvers began carving as an amusement is encouraging to amateurs. It is not necessary that a great deal of time should be devoted to the mere manipulation of the material; that is a fault of modern carvers. The principal part of the carvings of the present time are nothing more than a display of mechanical cleverness and skill in working the material. The old carvers were content to carve wood as wood, caring little for the fineness of the work, so long as it expressed some noble thought or some beautiful idea. We are afraid such books as we are now considering have a tendency to lead the amateurs to devote too much time to the mechanical part of carving.

* Fret Cutting and Perforated Carving. Bemrose and Sons, London.

CAB-RIDES FOR NOTHING.—LONDON BARRICADES.

Our friend, the London cabman, is usually considered a proficient in the art of extortion, and the last person in the world likely to give his professional services gratis. This, however, is only partially true. In one part of London, it is quite a common thing for cabby to stand and offer the use of his vehicle freely to the first passer by, who will accept it—he will even thank those who avail themselves of his offer. However, like most of our poor humanity, a selfish motive lurks in the recesses of cabby's breast. The offer is only made in the neighbourhood of those London barricades, the private street bars and gates, to which we called attention a short time ago. Cabby is not allowed to pass these sacred barriers with an empty cab, and, as it is often an object with him to save time and distance, he loiters about till he finds some workman or poor person who will accept a lift, "for the honour of the thing," whereupon he drives up boldly to the gate, which is duly opened by the obsequious beadle, and cabman and "fare" pass triumphantly through. We call attention to this, as a very practical illustration of the inconvenience and obstruction caused by these barriers. If the London cabman finds it worth his while to resort to such an expedient, no further demonstration can be wanted that the free opening of them all would greatly facilitate other traffic. When cabby cannot get through with his empty cab, he is obliged to take it round other and more crowded thoroughfares, to his own and the public inconvenience. The same thing takes place in the case of loaded vehicles of all kinds, which are not allowed to pass at all, unless going to the inhabitants of the district; they thus crowd our other streets and contribute an enormous quota to that great roar and traffic which, let it not be forgotten, causes every week the destruction of four valuable lives, not to mention the maiming and injury of between thirty and forty others. Are we not a foolish generation to spend hundreds of thousands upon the formation of new streets to relieve this traffic, while so many of the old thoroughfares are closed for private pleasure or convenience?

WALNUT-TREE LITANY DESK, ST. ANDREW'S, WELLS-STREET, AND ALABASTER LECTERN AND CANDELABRA AT WORCESTER COLLEGE OXFORD.

We this week present our readers with a double plate, one representing a carved walnut litany desk, executed by Mr. Robinson, of 173, High Holborn, for St. Andrew's Church, Wells-street; and the other a lectern and candelabra lately fixed in the Chapel of Worcester College, Oxford. These were carved by Mr. Jacquet, of Stanford-street, Vauxhall-bridge-road. The figures of the latter and rough models of those in the litany desk were executed by Mr. Nicholls, sculptor, Hercules-buildings, the whole being designed and made under the superintendence of Mr. W. Burges, architect.

MANCHESTER NEW TOWNHALL.

We understand that at a meeting of the Manchester City Council held on Wednesday, the Mayor stated that the report of the architects consulted in respect to the designs and plans of the New Townhall, namely Professor Donaldson and Mr. Street, had been received. Those gentlemen name five of the eight sets of plans with approval, and recommend one for selection by the Council. It is pretty generally believed that the architect of the design recommended by the referees is Mr. Alfred Waterhouse, the architect of the Manchester Assize Courts. It may be mentioned here that the eight competitors are Mr. Brodrick, Mr. W. Lee, Mr. J. O. Scott, Mr. T. H. Wyatt, and Mr. Waterhouse, of London, Messrs. Speakman and Charlesworth, Mr. Worthington, and Mr. Salomans, of Manchester.

MR. RUSKIN ON ART TEACHING.

It appears that Mr. Ruskin has been invited to the forthcoming Exhibition of the Wakefield Industrial and Fine Art Institution. We regret to hear, however, that, owing to ill-health, Mr. Ruskin has been obliged to decline the invitation. In the course of an interview granted to the Mayor of Wakefield and other gentlemen on the subject of the institution, Mr. Ruskin remarked that he had been in indifferent health during the last two years, and for some time past had avoided public meetings, wishing to reserve his remaining years for quiet work. In the next place, his opinions upon the best manner of teaching art had lately undergone much change. He remarked that we had long been working from the wrong end; we had been trying to work downwards instead of upwards. All true art must be the efflorescence of a people's joy—the spontaneous outpouring of their inner happiness. The right way to lay the foundation of art, he believed, was to improve the condition of the dwellings of the people, by rendering them more comfortable and decent; to make the streets of our towns cleaner and less unsightly; to study more the purity of Nature, to consume our smoke, to cleanse our streams, and to use every means in our power to raise the people from the squalid misery and vice into which they have sunk—such misery and vice that a true-hearted man entering the slums of one of our great towns, if he did not perish by violence, must die of grief to witness the bitter wretchedness of the inhabitants. In these days, he said, we had too much mere talk of improvement; we thought too much of mere words; we paid too much attention to what a man said than to what he did. If there was any recollection of the little he had done, he should prefer to use what influence he possessed in quietly helping forward societies and institutions of a benevolent and charitable kind, and all such means as would promote the objects he had pointed out. On his being informed of the whole scope of the Wakefield Institution, Mr. Ruskin expressed his hearty approval of it, and said, although he could not come to the opening meeting, he should endeavour to send to the museum of the institution a leaf from some old missal, with a few words which he would himself write upon it, or a few objects of art which would not be without some helpfulness towards the main object of interesting the working classes. He now spent much time in examining and arranging minerals, in order to extract from them the many principles they contained; and he should, if he were able, also prepare a small series of minerals in a way which would be interesting, and send them to the museum, where they would, he hoped, be considered of value, not for their intrinsic worth, but for the lessons they would teach. There were great lessons of morality to be studied in a piece of quartz—still more in the forms of animal life. Ever since the great struggle between good and evil had commenced, since the serpent and the dove had first existed, these great lessons had been set before mankind in ever increasing circles.

On Wednesday next Mr. Thomas Beggs will read a paper before the Society of Arts, on "Courts of Arbitration and the Principles of Co-operation, as means of bringing into harmonious action the Interest of Capital and Labour." The importance of the subject, and the able manner in which, in all probability, it will be handled, will, no doubt, attract a large meeting.

VERIFICATION.

WHEN we stated last week that the more a true statement was examined the more it became manifest, we did not expect that it would, in connection with the Pugin and Barry controversy, so soon receive such a complete verification. It will be remembered that Dr. Barry put as a frontispiece to his pamphlet a photograph of the drawing for the throne of the House of Lords. Mr. Pugin said that he saw his father make the design for the throne. Mr. Burton spoke from his knowledge that he knew the design was executed by Mr. Pugin's hand. Mr. Herbert also stepped on the stage and said he also saw Mr. A. W. Pugin make the drawing with his own hand. In answer to these statements Mr. Charles Barry, in a letter to the *Standard*, twits Mr. Herbert for his "powers of imagination," and says there was "not a line of Pugin's in the drawing in question, and further I say that any architect who was acquainted with the style of the two could not hesitate for a moment in recognising my father's hand throughout the drawing." He proceeds to rebuke Mr. Herbert for making "statements quite untrue," and for not "taking the slightest pains to test such statements." Whereupon Mr. Herbert returns to the charge, and solemnly declares that he saw Mr. Pugin make the "design" for the throne. His letter is as follows:—

SIR,—I would gladly have made a bridge of gold for Mr. Barry, as I do not doubt that he believes that his father made the design from which the photograph in Dr. Barry's pamphlet is taken. I would, however, ask him whether his father was in the habit of inserting in his own designs the initials of Augustus Welby Pugin? I ask this because I find in the upper part of the profile of the canopy of the throne between the pinnacles, on the left of the photograph, the separate initials, A. W. P., which my old friend had the habit—I might say the providential habit—of dropping into all kinds of places in furniture, hangings, metal work, &c. This is not a question of "imagination." Every person who will use his eyes may see (even in the small photograph) the initials, and all the world may judge whether I have given testimony in matters entirely unknown to me.—I am, Sir, your faithful servant, J. R. HERBERT, R.A.

7, Grove-end-place, St. John's Wood-road, Feb. 3.

This, then, puts the controversy for ever at rest. No destruction of documents, no suppression of evidence, no tortured interpretation of particular words, no special pleadings, will ever make the fact different. A drawing, and no less a one than that of the throne in the House of Lords, has been presented to the world as from the hand of Sir C. Barry, though it was nothing like anything that Sir Charles did, and resembled in foundation, feature, and spirit every drawing Augustus Welby Pugin executed. We can say, with the editor of the *Standard*, that we have carefully examined with a magnifying glass the photographs published by Dr. Barry in his pamphlet, and there is no possibility of doubt that the letters A. W. P. are to be found there. Mr. Barry in his last letter says, that he fails to see the letter A., and that the letters W. P. are intended for the Prince of Wales. The letter A. is written almost as plainly as W. P., and there it stands as an ineffaceable testimony that Augustus Welby Pugin designed the throne.

A great deal has been said about Mr. Pugin not accepting the offer of submitting the matter to the arbitration of the council of the Institute of Architects. As it is not matter involving any principle of architecture but purely a question of evidence, we do not see that a committee of architects would be the best tribunal to investigate it. If a court of arbitration be appointed, the legal mind should be largely represented in it. Let architects by all means form a portion of the court. If any such step be taken the best way would be to appoint a commission of enquiry, in which the persons most interested, and the general public should have confidence. If it were a question of altering the Houses of Parliament, or of passing an opinion on its architectural merits, the Council of the Institute would be a proper body to appeal to.

THE ARCHITECTURESQUE.

IT has been remarked that the man who can make two blades of grass grow where only one grew before should be regarded as a benefactor of mankind. We suppose that a proportionate amount of credit is due to him who contributes an additional word to our vocabulary, if the word be truly and really an addition. That, of course, is the important point. It must be something more than a word—it must be the word, one that is happily conceived, and exactly adapted to convey to the mind the idea intended to be conveyed. Moreover, it seems almost indispensable to its general acceptance that such term should be euphonious, smooth, and soft; it should come pat and glib to the tongue. It ought not to be a word hard to pronounce, a "jaw-breaker," or one of sesquipedalian proportions. Whether the new term which Professor Kerr is anxious to see added to our stock of architectural phrases altogether fulfils these conditions may safely be left to the decision of our readers. It will doubtless occur to some that the adjective "architecturesque" sounds not very musically on the ear, and that still less does the adverb "architecturesquely." They are a sort of five-barred gate words, rather difficult to get over comfortably. Nor is their meaning plain at first sight. Professor Kerr explained, in his address at the Architectural Association last week, that he found argument and justification for the use of architecturesque in the word "picturesque"; and this, by the way, is precisely what we cannot call the other word. It is not picturesque. But let us give in brief Professor Kerr's idea. Picturesque he defined as signifying worthy of being painted. It was purposely to fix and define this idea that the word was introduced into our language. It formulated a most valuable and essential idea. Having described the landscape painter's notion of what a picturesque subject was, he went on to say that he thought it desirable that we should have some word that would be equally useful in connection with the fine arts in architecture, one that would carry with it the same idea in regard to their own art. He suggested "architecturesque." It signified the picturesque in architecture, or architecture worthy of being painted. The word "picturesque" was not a mere name, but an entity of the painter's art upon whose existence he depended. And why should we not suppose a similar entity in other arts? Architecture was an essence of form and disposition. It used to be called the beautiful in building. For building was not architecture, nor was architecture building. There were various modes and various fashions of the picturesque. At one time the Italian villa was considered picturesque, then the Elizabethan style was so considered. Gothic churches, whatever else they might be, were always picturesque. Mediæval architecture was essentially so, and the French chateau and the Scottish castle, though not always comfortable places to live in, were always picturesque. Now, the architecturesque was architecture and nothing else. The Parthenon was cited as a building which had not one element at all picturesque, and it showed that the Greeks were a thoroughly architecturesque people. The site of the building, however, was picturesque. The Egyptian temples, again, were architecturesque and not picturesque. The Pantheon at Rome was the same; there was no attempt to make it pictorial. It was the same again with the Pompeian house, which was eminently architecturesque. We were thus led to perceive, according to Professor Kerr, that Classic work and Oriental work generally were essentially and primarily architecturesque only, and that mediæval architecture, on the other hand, was picturesque. Pursuing his idea into other arts connected with architecture, he observed that architecturesque painting implied subordination to architectural principles and forms. Then he took occasion to remark that the decorative paintings of Mr. W. B. Scott, which were recently illustrated in the BUILDING NEWS, were not, in his opinion, treated architecturesquely. They were admirably executed as paintings, but they had not been subordinated to architectural principles. Sculpture also ought to be adapted to the forms and purposes of the architect—that was, it should be treated architecturesquely. The statues at Temple Bar, though excellent sculptural works, were not adapted to their situation, and he thought that the statue of Sir Robert Peel at the New Palace at Westminster would present a very meagre and inartistic effect when unveiled. Its position was decidedly bad. As seen through the railing it looked like something inside a cage. Professor Kerr also instanced furniture, observing that cabinet makers always objected to the architect's designs for furniture. The reason was that the architect kept himself anxiously to architectural principles and failed to perceive the cabinet making principles. If furniture was to be well adapted it must be done by the architect. But it must be treated architecturesquely. In designing an interior, one is apt to treat it architecturally. Now, the first object of a plan being convenience, it must be treated architecturesquely. Adverting next to landscape gardening the Professor dwelt upon the architecturesque style of Italian, and the picturesque style of English gardening. In speaking of site, he said the Houses of Parliament had been treated by Sir Charles Barry as an essentially architecturesque building with reference to its site. The Thames Embankment had an interest to architects for the same reason. It was certainly an effort of the architecturesque. And the principle was to be seen in perfection in Paris in regard to the treatment of its streets. That city offered a striking contrast to the mediæval town, with its winding zigzag streets, and many turnings and corners, which were so picturesque. He thought this object was one of great importance, and if so, why, he asked, was it so completely neglected, as it was in London? There was not the slightest attempt made to dispose of our most costly buildings with a view to their architecturesque site, which would simply double their value. In concluding his address, Professor Kerr said that the subject of the architecturesque being entirely new, he had had no authorities to consult. He merely, therefore, suggested and offered reflections of his own. It was possible that he might be more or less wrong in his conclusions, but he hoped he had made his meaning intelligible. The subject, as it appeared to him, was one well worthy of careful study and further development.

The Professor's address, we may say, evoked, or provoked, less discussion than almost any address we ever remember to have listened to at the Association. Probably this was owing to the peculiar novelty of the subject. It certainly did not lack interest at the hands of Professor Kerr. However, there appeared to be a more than usual shyness, or at all events reticence, among the members, and very few opinions were ventilated. A vote of thanks to Professor Kerr was moved by Mr. Tarver, who thanked the lecturer for having given them a new word, which he thought they might often have occasion to make use of. He, however, differed with the Professor respecting his definition of mediæval architecture, which he conceived had as much of the architecturesque in it as the Greek, or as the Pantheon, for instance. A similar opinion was expressed by Mr. Lacy Ridge, in seconding the vote of thanks. This gentleman held that Gothic architecture contained all the same elements of beauty as the Classic *plus* the picturesque. He also objected to the description given of mediæval towns, where there was no absence of straight lines any more than in modern towns. As to the French capital he sincerely hoped that they would avoid the style adopted there. It was utterly dry and uninteresting. Mr. Phené Spiers, the

chairman, did not agree with Professor Kerr's opinion that the northern nations had gone in so exclusively for the picturesque, while the eastern nations had followed the principle of the architecturesque. The Egyptian statues supporting buildings, however, he thought, afforded an apt illustration of his argument, for those figures were invariably treated architecturesquely. He also agreed with the objection taken by the lecturer to Mr. Scott's decoration. The figures had the appearance of being cut off by the arches. He mentioned similar decorations designed by Rosetti at Oxford. They were some paintings round windows, and portions of the heads and figures were actually missing. Besides, the light coming in through the window prevented the picture being seen, and the effect was entirely lost. He hoped the buildings to be erected along the Thames Embankment would be treated architecturesquely, like the Houses of Parliament, and, though he himself did not object to a little irregularity in style, he was in favour of following the example of our French neighbours in this respect.

THE INTERIOR OF ST. PAUL'S CATHEDRAL.

THE notorious John Wilkes, it will be remembered, was confined in the Tower for calling the House of Commons a "den of robbers." He was compelled to make an abject apology on his bended knees before the House. On rising he addressed the Speaker in his usual sneering manner, and said, rubbing his knees, "After all, Mr. Speaker, this is the dirtiest house I was ever in." And for this he was sent back to the Tower. Had Mr. Wilkes seen the interior of St. Paul's he might have used similar language. We are afraid that St Paul's Cathedral is the dirtiest cathedral in England or anywhere else. Several complaints have reached us regarding its very neglected state. It is complained that dust and dirt lie thick in all parts of the edifice, and that one or two of the marble monuments in particular are disgracefully dirty. Surely some little attention ought to be bestowed on these interesting and beautiful memorials of the dead. No one who has seen the cathedrals on the Continent could fail to have been struck with their great cleanliness as compared with those at home. Compare, for instance, the Notre Dame in Paris with St. Paul's. The "dim religious light," of which Milton sings, is scarcely applicable to St. Paul's, if we except the dimness which is owing to dirt. It is this which gives the noble interior an oppressive rather than impressive air. It is dull rather than solemn. As compared even with other English cathedrals, the greatest cathedral in the country is wretchedly looked after.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT a special meeting of the members of this Institute held on Monday last, the recommendation of the council that the Royal Gold Medal for the current year should, with her Majesty's gracious sanction, be awarded to Austin Henry Layard, D.C.L., M.P., was unanimously adopted.

The following medals and prizes were awarded:—The Soane Medallion, to which, under certain conditions, the sum of £50 is added by the Institute (subject of competition, "Design for a Townhall") to W. George Walls. A second prize of £20 was given by W. Tite, M.P., president, to Mr. Henry L. Florence, whose drawings were considered next in order of excellence; and a medal of merit to Mr. Herbert M. Marshall.

The late Sir Francis E. Scott's prize of £10 10s. (subject of competition, "An Establishment for Baths and Wash-houses, designed in accordance with modern requirements, and in the style of the thirteenth and fourteenth centuries") to Mr. Ernest Lee.

The Institute Silver Medal, with £5 5s. (subject of competition, "The Restoration of the Choir of Old St. Paul's Cathedral, founded on the Plates illustrating Dugdale's Work"), first prize to Mr. Edmund B. Ferrey; medal of merit to Mr. H. Renault Mangin. In this competition, Mr. E. B. Ferrey, complying with the conditions prescribed in the last year's list of prizes, sent in drawings illustrating the restoration of the entire cathedral.

The Institute Silver Medal, with £5 5s. (subject of competition, "Measured Drawings of any Building erected before the year 1700, and hitherto unpublished,") to Mr. William Henman; medal of merit to Mr. Charles H. Heathcote. In this competition the drawings of Mr. Morton M. Glover were "honourably mentioned."

The Institute Medal, for the best essay "On the Origin and Progress of Window Tracery" or other suitable subject, was awarded to Mr. W. Scott Champion.

The designs, drawings, &c., are now on view from ten to five daily at the Institute, where they may be inspected by anyone bringing a card of introduction from a member.

BUILDING AND LAND SOCIETIES.

IF we are to rely on report, unanimity of feeling and purpose does not seem to prevail at the Board of the London Land and Building Company (Limited). At the annual meeting of the company which was held at the London Tavern last week (Mr. W. T. Makins presiding), there was an unusually large attendance of shareholders. The report of the directors stated that no new obligations had been entered into since the last annual meeting. The amount received from the estates sold has been somewhat less than the directors anticipated; but this has arisen, partly from forcing the sale of property the mortgages on which were called in, and partly from the premature realization of leasehold estates, the holding of which would have necessitated further outlay in new buildings to the extent of nearly £100,000. The whole of the shareholders not assenting to the alteration of the shares from £10 to £5, as proposed by the directors in circular of January 1st, 1867, the contemplated reduction could not be effected, and another plan for the same purpose, suggested by the directors, in circular of August 26th, 1867, was likewise frustrated, by the non-co-operation of shareholders. The directors retiring by rotation were Messrs. W. T. Makins and T. H. Harris, who were eligible for re-election. Messrs. Simpson, Fraser, Johnson, and Churcher having resigned, the directors had elected Messrs. H. F. Makins and J. Smith, whose election requires confirmation by the shareholders, in accordance with the articles of association. After a long and angry discussion, says the reporter, in the course of which two amendments were made and withdrawn, the report was adopted, the retiring directors and auditors re-elected, and the election of Messrs. H. F. Makins and J. Smith, as directors, confirmed.

The "Birmingham Post" announces with much regret the failure of the Victoria Freehold Land and Building Society. The affairs of the society have been placed in the hands of a solicitor, with a view to the presentation of a petition to the Court of Chancery, under the Winding-up Act. The liabilities are not yet precisely ascertained, but we believe that £30,000 is due to depositors, and that the deficiency amounts to about £7,000.

COMPETITIONS.

REFERRING to the Darlington Workhouse Competition, a report of which we gave last week, a correspondent in sending us an account of the proceedings at a meeting of the Local Board of Guardians, writes:—"You will observe that the professional gentleman selected for the first premium the drawings bearing the motto 'Nota Bene'; second, 'Economist'; third, 'A in a circle'; but the guardians have, it appears, been unwilling to go the 'whole hog' by allowing all the premiums to be sent out of the town, and, to save disrepute from falling on the local talent, have partly negatived Mr. Lee's well-considered decision by assigning the first place to 'Suum Cuique,' a townsman. Such is life—let us hope that 'A in a circle' is delighted and 'Suum Cuique' surprised. I can fancy the former being devoid of friends in court to assist him with a timely vote. When will those unhappy competition affairs be properly managed?" We quote an extract from the report of the meeting to show the amusing way in which certain matters are managed or mis-managed by local magnates. "At a meeting of the Plan Committee, it was moved by Mr. Rowlandson, seconded by Mr. W. Thompson, and carried unanimously, that the following resolution be recommended to the Board for its confirmation and adoption:—'That this committee accepts the opinion of Mr. Lee as regards the plan marked "Nota Bene," upon condition that the architect can give a guarantee from some respectable builder or builders that the work can be executed for the estimate he has given, namely, £9,000, including the alterations suggested by Mr. Lee.' Mr. Bowman moved and Mr Ward seconded that the second premium be given to 'Suum Cuique.' Mr. Thompson moved and Mr. Stephenson seconded as an amendment, that 'Economist' receive the second. The amendment was carried by a majority of two. It was moved by Mr. Spark and seconded by Mr. Bowman that the plans marked 'Poverty is no sin' are entitled to the third premium, whereupon it was moved by Mr. Thompson and seconded by Mr. Thomas Robinson that 'A with a circle' should take the third place. There were an equal number of votes for each of these propositions, and it was therefore agreed that the two plans should be referred to the Board for selection. At the meeting on Monday, on the proposition of Mr. Hodgson, seconded by Mr. Middleton, it was resolved that the recommendation of the committee with regard to 'Nota Bene' should be adopted. With regard to the second premium, Mr. Hodgson proposed and Mr. Middleton seconded that 'Economist' be accepted. Mr. Spark moved and Mr. Bowman seconded the acceptance of 'Poverty is no sin.' The original motion was carried. Mr. Ward proposed and Mr. Nesham seconded, that the third place be assigned to 'Suum Cuique.' Against this, Mr. Benson proposed and Mr. Robinson seconded 'A with a circle.' The motion in favour of 'Suum Cuique' was carried. The seals were then broken, and the names of the competitors were disclosed as follows:—'Nota Bene,' C. J. Adams, Stockton; 'Economist,' G. Styan, York; 'Suum Cuique,' R. B. Dixon, Darlington; 'A with a circle,' W. Snowdon, jun., Bishop Auckland; 'Poverty is no sin,' G. G. Hoskins, Darlington; 'Oxenham,' G. W. Hamilton, Liverpool; 'Freemason,' W. Bryson, Darlington; 'Efficiency and Economy,' J. J. Bradshaw, Bolton; 'Knowledge is Power,' M. Thompson, Newcastle; 'Palmam qui meruit ferat,' W. Peachey, Darlington; 'Palmam non sine pulvere,' Messrs. Paton and Thompson, Bradford; 'Pro Bono Publico,' C. Eaglesfield and Sons, Maryport; 'Red Seal,' J. Ross, Darlington; 'Spen,' J. P. Pritchard, Darlington; 'The poor shall not always be forgotten,' W. H. Blessley, Middlesborough; 'Red Star,' W. Longson, Liverpool; 'Alpha,' W. Hodgson and R. J. Lithgo, Darlington; 'Earnest,' J. E. Oates, Halifax. The chairman produced a number of testimonials to the ability of Mr. Adams, including one from his son."

WATER SUPPLY AND SANITARY MATTERS.

Mr. Codrington, Associate of the Institution of Civil Engineers, has addressed a letter to the Mayor of Reading, proposing to submit a plan to the Drainage Committee for the disposal of the sewage of that town. Irrigation of a sufficient area of land at Lower Caversham, above flood level, and an outfall from the irrigated land, aided by pumping, are prominent points in the plan. A saving of £7,000 in cost of works, and of a large sum in annual working expenses, is anticipated.

After much debating, the Health Committee of the Liverpool Town Council, by a majority, has at last put forward a distinct programme on the water-closet question. Till the next Session of Parliament it is proposed to continue the present system, but the Council is to recommend them to apply for Parliamentary powers to enforce the general adoption of water-closets, the cost to be defrayed by the Corporation and the owners, in such proportions as may hereafter be decided upon. It is also proposed to make an allowance, under certain conditions, to those owners who may have already been compelled to convert middens into water-closets. The cost of a wholesale conversion is estimated at £250,000, one half of which, it is assumed, will be borne by the owners, and the other half by the Corporation.

The results of Dr. Frankland's analyses of the water derived from the Thames, as we find them in the Registrar-General's weekly return, are not satisfactory. The waters contained impurities probably of an animal origin to a considerable extent. The waters of the New River, East London, and Kent companies were clear and transparent. The hardness was least in the West

Middlesex water (18), highest in the Kent (30). The Kent Company's water, delivered at Deptford, differs essentially from the other waters. It contained 59 parts of solid impurity in 100,000 parts, and of this impurity 15 parts were common salt, which it is difficult to account for, except on the supposition that the wells have some connection with the brackish reaches of the Thames.

Liverpool.—The idea of obtaining a water supply for Liverpool from Bala Lake appears to be favourably entertained by a number of the members of the Local Council. At a meeting of the water committee, on Monday, several members expressed the opinion that, instead of spending £160.000 on additional works at Rivington and on works at Dudlow-lane, it would be much more advisable to obtain powers to spend from £2.000,000 to £3,000,000 upon a scheme to obtain water direct from Bala Lake, in order that the supply to Liverpool might be continuous both for present and future want. After some discussion, the chairman stated that they were bound to proceed with the works sanctioned by the Council, and that, if economy were exercised, and the present system of water-closets recommended by the Council were not pushed too far, there might be a sufficient supply from existing sources for the next twenty years.

Building Intelligence.

CHURCHES AND CHAPELS.

A new Wesleyan chapel has been opened at Winlaton, near Newcastle. The style is an adaptation of Gothic, and the internal dimens 40ft. long by 28ft. wide. The building 250 persons at a cost of about £600. Mr will seat March, of Blaydon, was the contractor. Thomas

The Prebendal stalls of the choir of Wells Cathedral have been enriched with sculptured diapering from the designs of Mr. Ferry, the diocesan architect. These stalls, designed by Salvin, during the diaconate of Dr. Jenkins, are of stone, and placed between the piers of the choir arches, thus showing the bases of those piers, in groups of five; they consist of gabled and crocketted canopies, with sub-ogee arches, also crocketted, divided by pinnacles supported by slender polished Purbeck shafts. The names of the several Prebends attached to the Cathedral, numbering in all 57, are carved on the panels of these stalls. Some of the diapers are copied from ancient examples, and the very beautiful hexagonal Canterbury pattern has been employed on the Dean's and other stalls on the Decanery side. The Precentor's stall is marked by the introduction of harps and other musical instruments. Before the sculptured diapering was decided upon, the desirability of employing polychrome as a background was considered.

A new Wesleyan chapel, dedicated to St. Nicholas, has been erected at Tapshaw, near Hereford; the style adopted is Early French Gothic. The building consists of nave, with north and south transepts and chancel. In the apse wall are five lancet memorial windows, by Messrs. Heaton, Butler, and Bayne, representing Christ and the Evangelists. Mr. F. R. N. Haswell, of North Shields, was the architect.

On Sunday last the opening at Chester of a new Catholic and Apostolic church was celebrated by services at which the angel of the Catholic and Apostolic diocese and a portion of the priests and choir of the Liverpool church officiated. The church, which is a plain building in the Early Gothic style, is built of brick, and calculated to seat about 300. It consists, at present, of a nave and vestries for priests and choristers, but it is intended to add a chancel and spired tower. The architect is Mr. O. Ayliffe, of Manchester, and the building, as at present, was erected for about £1,500.

A new parish church has been built at Faccombe, Hants. It is in the Decorated style, having a tower and spire at the west end. The materials used are flint and Bath stone dressings. The church comprises a nave 52ft. by 21ft., chancel 18ft. by 15ft., with a vestry and south porch. Mr. G. B. Mussellwhite was the architect, and Messrs. Hillary, of Andover, the builders.

The manufacturing and colliery districts of Durham are gradually becoming well provided with places of worship. Churches have lately been built at Leadgate, Quarrington, and Burn Moor, and within the next six months there will, it is stated, be half a dozen new churches in the colliery villages round Durham city. The church erecting at Coxhoe is approaching completion, and the Wesleyan Methodists of Lanchester have in course of erection a handsome church in that village.

Halifax.—Plans for the new church in Rhodes-street have been prepared by Messrs. Mallinson and Barber, architects, Halifax. The church is designed in the Geometrically Decorated style of Gothic. The interior will be divided into nave, side aisles, and chancel. The length of the nave measures 82ft. 9in.; the width of nave and aisles, 51ft.; and the height from the floor of the nave to the roof, 48ft. The chancel will be 34ft. by 20ft. The church is calculated to seat 500 persons.

BUILDINGS.

A new warehouse for Messrs. Cox and Painter, drapers, at Malvern, has just been erected by Messrs. McCann and Everall, from designs by Messrs. Haddon, Bros., architects, of Malvern. The style of architecture adopted is Early Domestic Gothic. The materials employed are bricks with Bath stone dressings, the columns and mullions having Mansfield red stone shafts, with carved caps and abaci.

The old national school at Wakefield has been reconstructed and adapted for the Wakefield Fine Art and Industrial Institution, and will be opened in April. The architect employed was Mr. W. Watson.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

Notice.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

Received.—G. W. N.—E. A.—W. S.—H. I. G.—I. T.—W. C. B.—B. and P.—W. B.—P. and K.—P. and M.—S. and J.—B. J. T.—I. W. H.—E. F.—T. P.—W. H.—I. H. A.—G. N.—W. I. J. F.—W. I. C.—E. W.—E. P.—G. H. G.—H. N.—A. W.—M. and Co.—I. H.—I. R.—H. and Co.—E. G. P.—S. J. H.—W S.—S. and B.—C. P.—W. P.—G. R.—I. I. S.—N. and Son.—B. and Co.—I. H.

R. F. G., Glasgow—The "Old Book" is the best.

A. Hayes., Manchester.—We have made our arrangements.

C. R. P.—The price of binding the Building News will depend on the manner in which the work is done.

Cautia.—The number is out of print. We do not know whether the paper on Iron Girders was reprinted by the author.

Correspondence.

ORGANS.

To the Editor of the Building News.

Sir,—As architects are continually employed more or less directly with this instrument, perhaps a few words on the condition of the trade may be of use. Organ builders in England, with one or two exceptions, are essentially tradesmen—not artists, nor craftsmen. You will find in English organs all the names of the celebrated stops of Schulze and Cavaillé, but these have not the slightest resemblance to them in tone. As a rule, English organs are very cheap, although very pretentious in appearance. The pipes are made of very inferior metal that costs very little indeed, but the right mixture to get beauty of tone is very costly. You may make wooden pipes of cheap, bad, new wood; you may make the bellows one third the full size; you may have inferior mechanism throughout. All these things are pretty generally done in England. The churchwarden idea of getting something cheap and showy prevails. An organ builder should be a man of innate taste for sound—to this he must add artistic and mechanical knowledge of a high order. He must be a man of taste and education; a great knowledge of mechanism will not produce a fine instrument, there must be also great taste. There are at the present time three builders of organs who are really artists in their craft, and who produce instruments of the highest merits. Schulze, of Paulinzelle, in Saxony, is remarkable for fulness and richness of tone, power of bellows, and excellent mechanism. Cavaillé, of Paris, is remarkable for delicacy and refinement of tone in his reeds. There is a beautiful instrument by him in the Carmelite Church at Kensington. Schulze has instruments at Doncaster and Leeds. T. C. Lewis is remarkable for excellent mechanism, power of bellows, and for the fulness of tone so well known in Schulze; he has also a good deal of Cavaillé's merit; he may be described as a pupil of Schulze. There is a good small instrument by him in Christ Church, Clapham, and a fine instrument at Shields. One great disadvantage in England is the general absence of any high scholarship in music. We are deluged with clerical amateurs with half knowledge—with crotchets—all of which are very detrimental to the real interests of music—I am, &c.,

A. B. C.

CHAPEL ARCHITECTURE.

Sir,—I have read, with considerable interest, your somewhat severe critique on "Architecture and Independent Dissenters" in last week's Building News. In some things there said I do cordially unite, but I must protest against the sweeping condemnation with which you visit the whole denomination, simply because the designs published in the last Congregational Year Book are not up to the standard of earlier years. You must not, however, suppose that the Year Book contains plans of all the buildings the denomination has erected during the past year, and I have little hesitation in saying that many of the best buildings find no place in that Year Book, beyond the bare announcement that such-and-such places have been opened. In the Building News for January 3, mention is made of a Congregational church, erected at Driffield, at a cost of £15,000, from designs by Mr. H. J. Paull, of Manchester. I believe this building will not suffer by comparison with anything that has been done during the year, either in church or chapel architecture; and I am the more induced to notice this because you have ventured, in a left-handed manner, to compliment the architect as having, in some way or other, learnt "a little of the art of architecture." I will not attempt to describe the work, architecturally or otherwise; the building is here, and will of itself testify whether anything decent has been done during 1867.

I believe architects are too often hampered with conditions, which in many cases it is impossible to carry out. Tower and spire are stipulated for, and when cost has to be considered, a sum ridiculously small is named, and the consequence is an erection more or less contemptible. In the case I have named, the committee in their instructions, with a judgment too seldom displayed, simply stated the amount of accommodation required in a given space, and left all matters of detail to the architect, who was to be the judge of the style of architecture best suited to the locality. The committee have every reason to be satisfied with the result—a thoroughly substantial building, massive without clumsiness, clean, comfortable, well ventilated, and at what everyone would consider a moderate outlay. It would be unwise to look upon this as an isolated case. I believe "Independent Dissenters," as such, have as keen an appreciation of the beautiful and the correct in art as any other body of public men.—I am, &c.,

Driffield, March 2, 1868. A. B.

MR. TARVER ON SYMMETRY.

Sir,—Will you favour me with a little space to explain that the paper that I read on "Symmetry from a Gothic Point of View" was, in fact, no more than the following proposition, submitted with all deference to my fellow students in the Architectural Association:—"Should not the study of Gothic architecture be undertaken with as much reverence for symmetry as that of Classic architecture?" From the censure passed on me by "A. O. X." your readers might infer that I had taken a very different ground, and had denied the existence of symmetry in Classic work; even the short report of my paper that you were good enough to publish in your number of the 21st ult., will dispossess their minds of such an idiotic assumption on my part. If "A. O. X." had been present at the meeting, and had favoured me with his remarks on the spot, by taking part in the discussion, I would have attempted to answer him. Two of the newspaper reporters kindly asked me for the paper in full, and I at once declined to publish my youthful—very youthful—efforts to appreciate Gothic principles; and I must, therefore, be

excused from defending in print that which I did not venture to offer to public criticism.—I am, &c.,

Edward J. Tarver.

10, Craig's-court, Charing-cross, March 3, 1868.

Sir,—Your correspondent "A. O. X." appears to argue from speculations rather than from facts. It is very evident he was not present at the delivery of Mr Tarver's paper, had he been, he would have heard Mr Tarver preface by saying that he simply took the matter up as a student for the consideration of his fellow students, and with no intention to dogmatize. The title of the paper was not "Symmetry," but "Symmetry from a Gothic Point of View," and therefore, it is not surprising that he confined himself to his subject. Had "A. O. X." taken the trouble to have made a few inquiries about Mr Tarver, he would not have made the strong personal attack he has done, for those who know him know also that he has not neglected to measure and draw to scale ancient examples in England and France, and so far as following the advice of Mr Harris, I will say, that if that gentleman has any disciples Mr Tarver may certainly be reckoned as amongst his first and foremost. For the benefit of your correspondent and others, permit me to state that the whole sum and substance of the paper was this—endeavour, by careful study, to discover the principles that actuated the designers of the mediæval building, and by this means obtain for your building the symmetry possessed by many Classic buildings. At the same time gain greater truthfulness between plan and elevation; and rather study the necessities of the nineteenth century than reproduce or adapt designs made for other climates and requirements.—I am, &c.,

A. A.

Sir,—Having had the honour of occupying the chair when Mr. Tarver's paper was read before the Architectural Association I feel it my duty to inform the readers of the Building News that he most distinctly disclaims all attempt at dogmatic teaching, and simply set forth his opinions for discussion among his fellows. This renders the criticism of "A. O. X." altogether unfair; and I can only hope that "twelve days" will suffice to make him feel it "very strange" that he could have written anything so grossly personal. To those who know Mr Tarver intimately, the advice of your anonymous correspondent as to drawing and measuring seems to savour of impertinence. Feeling sure that your columns will not be less open to defence than attack—I am, &c.,

Lacy W. Ridge.

28, Bedford-row, March 2, 1868.

CAUTION.

Sir,—I will, with your permission, claim a few lines in the Building News to caution its readers against a man who is going about to various architects' offices under the following pretence. He came to the office where I am employed and asked to see the "Governor," who was not in at the time. He then told me a very pitiable story about his having been articled to an architect and civil engineer, who had gone abroad; and he added that he had been out of employment for six months, and had not had anything to eat that day. I gave him a trifle and started him. The next morning he came and said that Mr ——, a leading architect of the day, had given him employment, and that his instruments were in pawn, and, if I would lend him the balance he wanted, he would return it on Saturday. I thought it a hard case, and (though very suspicious of him) I lent it, and immediately wrote to the person he named, and found he had been neither seen nor employed there. He said he was a Welshman (he might also have added a "Welsher"), which I found correct on asking him a few questions. He is tall, with fair moustachios, and poorly clad.—I am, &c.,

Fleeced.

Intercommunication.

QUESTIONS.

[762.]—FIXTURES.—If a covenant in a lease states that fixtures are to be delivered up at the end of the term, can the lessee claim, in addition to landlord's fixtures, what are usually considered tenant's fixtures? In a legal point of view, it appears to me that this would be so, but I should be glad to know what is the usual custom in such cases.—J. J.

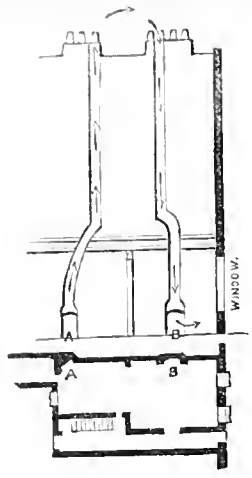
[763.]—FILTERING.—I want to filter 1,200 gallons of rain water, caught in a tank used for laundry purposes; can any of your readers inform me of a cheap and effectual way of doing this?—E. H. H.

[764.]—PAVING TILES.—I have been told there has been recently published a set of designs for laying paving tiles of only three colours so as to get a pleasing variety. I should be obliged by being informed where I could obtain the above designs.—H. W. B.

[765.]—BLACK STAIN. Will you, or any of your readers, kindly inform me how to make the black stain used by gasfitting manufacturers to stain the metal before black leading, in green bronzing. Also how to make green, ormolu, French gold, and pale lacquers?—F.

[767.]—THE BUILDING ACT.—In the back yard of the house next mine stands a building contrary to the Building Act, but it has been in existence about two years. Can any of your readers inform me whether there is any limit to the time after the erection of a building during which the District Surveyor has power to interfere, and if so, what that limit is?—Building Owner.

[766.]—SMOKY CHIMNEY.—Would you, or some of your correspondents, kindly inform me of some way to cure a chimney? In the accompanying sketch you will find two



fireplaces and chimneys, marked A and B: when there is a fire in A and not in B the smoke comes down B and fills the rooms with smoke, so that we are obliged to open the doors and windows for a time, more especially in the evening.—Smoky.

REPLIES.

[736.]—RESERVOIR BOTTOMS.—In answer to J. W. H. of February 7, I would advise him to cover the bottom of his reservoir with concrete, about 9in. deep, to prevent the growth of vegetation and facilitate the process of cleaning when empty. Good concrete will cost about 12s. per cubic yard, if stone and sand are easily procured, mixed in the following proportions:—one measure of blue lias lime to three of clean sand, and four of broken stone, well pounded together before setting commences.—Wm. Watts.

[749.]—ILLEGIBLE INSCRIPTIONS ON SILVER COINS.—To read illegible inscriptions on old silver coins, lay the coin on a red hot iron. The parts which have been most compressed in the die oxidize at a higher temperature than the other parts, and remain a lighter colour. See "Sir David Brewster's Letters on Natural Magic."—Ardwick.

[751.]—ROOFAGE WATER.—The average rainfall in the midland counties will be about 30in. per annum. But "M. Paynter" must construct his underground tank to hold the greatest rainfall in twenty-four hours, which we will take at 2in. deep upon every square foot of his roofage; *i.e.*, 90,000 × 144 × 2 = 25,920,000 ÷ 1728 (the number of cubic inches in a foot) = 15,000ft × 6·25 (the number of gallons in a foot) = 93,750 gallons. A tank, therefore, 42ft. by 36ft. by 10ft. will hold 750 gallons more than what is needed, but it is better to have room sufficient. The only thing to look at is a capacity of 15,000ft. or twenty-four hours' rain, whatever that may be, and construct the tank accordingly. I shall be glad to render your correspondent any further assistance.—Wm. Watts.

[751.]—FLEXIBLE IVORY.—"Ilminster" can make ivory flexible by immersing it in a solution of pure phosphoric acid of sp. gr. 1·30, and leaving it there until it loses its opacity. It must then be taken out, washed in water, and exposed to dry air till it hardens. It will resume its pliancy on immersion in hot water.—Sans Peur.

WAGES MOVEMENT.

The North Shields operative painters turned out on strike on Monday for Saturday half holiday. They were paid 30s. a week.

The operative masons of Hamilton, near Glasgow, are on strike for an advance of wages.

STAINED GLASS.

A stained glass memorial window has recently been fixed in the parish church of Winslow, Bucks, erected by Mrs. Miles, in memory of the Rev. J. Miles, B.D., late incumbent of Holy Trinity Church, Paddington. The lights are four, the subjects being—the Agony in the Garden, the Crucifixion, the Resurrection, and the Ascension. The work was designed and carried out by Mr. A. J. Mingaye, of London.

The east window of Horspath Church, near Oxford, which is in the Perpendicular style, has just been filled with stained glass at the cost of the Rev. H. R. Bramley, Fellow of Magdalen College. The subject, which extends across three openings, is the Crucifixion; our Lord and Mary Magdalene in the centre, and in the side compartments the figures of the Marys, St. John, and Salome. The whole is surmounted with a canopy. The tracery is filled with figures of St. Frideswide, St. Giles, St. Mary Magdelene, and St. John Baptist, patron saints of the diocese and church combined. The window was designed and executed by Mr. G. J. Baguley, of Newcastle-upon-Tyne.

STATUES, MEMORIALS, ETC.

The high cross at Taunton has just been completed. It is 30ft. in height, and is built of Ham-hill stone, with pillars of dark polished marble. At the base are three steps of blue Portland stone. The northern and southern faces contain drinking fountains, and half way up are niches for six statues. The top is spire-shaped, and is surmounted by a carved cross. The new cross has been built by Messrs. Shewbrooks, of Taunton, from designs by Messrs. Giles and Robinson, architects, of London.

LEGAL INTELLIGENCE.

A District Surveyor's Fees.—Mr. Albert Nicholls Bryett, builder, of 116, St. James's-road, Holloway, was summoned, before Mr. Cooke, by Mr. John Turner, of 8, Duerden-villas, Tollington Park, one of the district surveyors of Islington, to show cause why he refused to pay the sum of 15s., for surveying the erection of a cellar attached to a bakehouse, erected after the roof of the bakehouse had been covered in. Mr. Cooke—the case having been heard at great length on a previous occasion, and adjourned for the purpose to this day—now delivered a lengthened judgment, in which he laid down the principle that where an addition to a building was not contemplated and commenced before the main building was covered in, it could not come under the "additions" referred to in the act, covered by the first notice and first survey; but was an addition for which an additional notice must be given, an additional survey had, and an additional fee paid. He thought the builder had a right to say that the cellar now in dispute formed part and parcel of the bakehouse, and was intended to be included in the notice of June 12th, 1867. The wall of the cellar formed part of the bakehouse, and, though there was an external and not an internal communication, he thought that that did not make it a separate building within the meaning of the act. The cellar being therefore a part of the bakehouse, the surveyor was not entitled to another fee.

Professional Claims.—William Fogerty *v.* Hugh Moore.—This action was brought by Mr. Fogerty, the well-known architect, of Harcourt-street, before the Court of Exchequer, Dublin, against Mr. Moore, druggist, of Capel-street, to recover fees for plans, specifications, estimates, details, and part superintendence of the works of a warehouse proposed to be erected by the defendant in that city, and estimated to cost about £12,900. Tenders had been received from the leading builders and a contract nearly entered into, which was afterwards broken off. The defendant lodged £223 18s. 6d. in court. The case came on for hearing on Tuesday, the 18th ult., when Serjeant Barry opened for the plaintiff. After examination of Sir Charles Lanyon, M.P., President of the Royal Institute of Architects of Ireland, and the taking of a portion of the plaintiff's evidence, the further hearing of the case was postponed.

Our Office Table.

We hear that paraffin has been used with good results for the preservation of fresco wall paintings. Frescoes, in a very advanced state of decay, become quite solid after saturation in mineral turpentine. Further experiments are being made in its application.

Some interesting antiquarian discoveries, says a correspondent at Rome, have been recently made on the site of the Palace of the Cæsars. Signor Rosa, who directs the excavations for the Emperor of the French, has found the base of what appears to have been an altar, bearing an interesting inscription, stating that it was erected by "Curius Domitius Calvinus," who twice filled the Consular dignity in the years B.C. 53 and 40. This relic was found close to the basement of the temple of Jupiter Victor, raised at the close of the Social war, by Fabius Maximus, B.C. 80. In another part of Rome, on the site of the Emporium between the foot of the Aventine and the Tiber, Signor Visconti has brought to light numerous masses of rich ancient coloured marbles, some bearing dates of the time of Domitian.

Portable rustic bridges, composed of ropes so arranged as to be hastily thrown over a river to facilitate the transit of the native huckeries, have long been known in India; these, though differing so essentially in the simplicity of their formation and the fragility of their materials, deserve, nevertheless, from their similarity of principle, to be considered as the prototypes of our more elaborate and massive suspension bridges of iron. It has, indeed, lately been asserted, that the largest iron bridge in the world is in China, near Kingtung, where it forms a perfect road from the top of one immense mountain to another; moreover, it is formed by twenty chains bound together by cross chains, and is more than 150 years old.

The annual meeting of the Architects' Benevolent Society will be held at the Royal Institute of British Architects, on Wednesday next. We trust it will be well attended, and to the advantage of the friends of the Institution.

A public meeting, convened by the Amalgamated Society of Carpenters and Joiners, was held on Wednesday, for the purpose of presenting the accident benefit of £100 to George Bewford and Francis Johnns, two of its members, who have been permanently disabled from work. Mr. T. Hughes, M.P., presided.

The Liverpool Architectural Society has decided to present to the next meeting of the town council, a memorial setting forth that the present regulations affecting the building trades are anomalous, impracticable, and highly injurious to the interests of many individuals, as well as to those of the public generally, and requesting that such measures may be speedily adopted for the amendment of such regulations as to the council may seem expedient, after consultation with their official advisers, the representatives of the profession of architects, and the building trades.

Notwithstanding his very imprudent, and it must be said rather ridiculous infatuation for Lola Montes, there were a great many good points in the character of old king Louis of Bavaria, whose death, at the age of 82, is recorded. It is not generally known that he was very much devoted to art, and was himself an artist, though his talents were chiefly appreciative, not creative. He did not attempt to excel, or even to rival the works of Italian art; he merely reproduced them. The Pitti Palace, the Loggia de Lansi, obelisks, churches, basilicas, all Florence, Rome, and Ravenna, rose to new life in Munich. It has been said of him that he went to Italy as to his real home and country; he brought Italy home to his own German country. Every ward in the city of Munich was like one of the courts at the Crystal Palace. The buildings outside were mere copies, but the treasures within were genuine. The King was a good connoisseur and collector. Munich had its pictnres and sculpture galleries; it had its schools of painting and statuary; its Klenze, Oelmuller, and Gœrtner, its Cornelius and Schwanthaler. Since his dethronement, old Louis had devoted his time and means to the encouragemeot of the art to which he was so warmly attached.

There is a "London Central Painters' Hall" announced under a limited liability company, with a capital of £4,000, in 2,000 shares at £2 a share. It is intended to close the share list on the 1st of May.

The report of the Directors of the National Gallery states that 17 pictures were purchased during the year, at a cost of £4,382 10s., and that 17 others were received as bequests or donations. The gallery was visited by 1,469,942 persoos on the public days during 1867; 823,426 at Trafalgar-square, and 646,516 at South Kensington. The portion of grant for 1867-8 for the purchase of pictures according to estimate was £10,000.

The new edition for this year of the Royal Insurance Company's Almanack gives a detailed statement of the operations of the company for the past twelve months. The directors' report shows a favourable result in each branch of the Company's business, which is steadily increasing. It is now announced that henceforth the life assurers are to receive an increased share in the profits of the company, although the life bonuses hitherto distributed have been among the largest ever given by any Assurance Institution.

The Royal Commission on Trades' Unions recommenced their sittings on Tuesday last, and proceeded with the examination of witnesses.

The time for sending pictures to the Royal Academy for the forthcoming Exhibition is on Monday the 6th, or Tuesday the 7th of April next.

In confirmation of the opinion expressed by Mr. Mechi, of Tiptree Hall (see BUILDING NEWS of Feb. 28), relative to chimney-pots, a correspondent writes:—"Chimney-pots are a blunder. In the cities of New England, with fires and fuel of every character, such things are unknown, and scarcely have they a smoky chimney. The cause is that which you advocate—narrowing the draught just over the fire. In Boston it is done by a small zigzag into the flue."

The French Government has ordered a very powerful organ of Messrs. Cavaillé-Coll for the Cathedral of Notre Dame, the restorations of which are just completed, and a special commission has been appointed to watch over, and receive the work. The commission includes the composers Auber, Thomas, and Rossini, M. Benoist, professor of the organ at the Conservatoire, Baron Seguier, of the Academy of Sciences, several dignitaries of the Church, the Director of the School of Religious Music, M. Viollet-le-Duc, the architect, and several officials.

Husband-street and New-street, Golden-square, having fallen into disrepute, the Metropolitan Board of Works, on the application of the vestry of St. James's, Westminster, has ordered the names of those two streets to be abolished, and the whole line of thoroughfare to be called Ingestre-place. The subsidiary names in the following thoroughfares are also ordered to be abolished—Talbot-road, Paddington; Avenue-road, Bow; Alderminster-road, Bermondsey; Guildford road, South Lambeth: and the houses re-numbered. The board lately ordered that Red Lion-street, Holborn, should be incorporated with and named Lamb's Conduit-street; but, on the remonstrance of the inhabitants that theirs being the oldest of the Red Lion-streets in the metropolis should not be the first to be altered, the board has rescinded the resolution, and Red Lion-street remains as of old.

A new system of paving footpaths has been tried in Paris on the Boulevard de la Chapelle, where iron frames, measuring three feet square, have been laid, into which, by means of holes bored in the frame, are encased blocks of poplar, forming a capital pavement, the wood of the poplar having been selected instead of oak. The latter, from its non-absorbing qualities, was found objectionable. The system presents a pleasing effect to the eye, and appears to succeed. On each side of the footpaths are small conduits, by which rain-water is at once drained off into the side sewer.

The "Niagara Falls Gazette" says that workmen are engaged in putting cables over the river for the new suspension bridge at that place.

There are ten marble quarries now in successful operation in West Rutland, and three others in process of development. The entire thickness of the stone in these quarries is nearly 50ft., and is so stratified that it can be easily worked in separate layers, ranging from 1ft. to 6ft. in thickness. Successive strata frequently present a great variety, both in colour and quality, from purest white—the marble so valued by sculptors—to the coarsest of coloured rocks, the best often lying in close proximity to the poorest.

Baron Haussmann is girding his loins for renewed efforts in the way of demolitions and improvements in the French capital. His programme of improvements for the present year includes the opening of the Rue de l'Imperatrice and the Rue Réaumur, the completion of the two new boulevards of the Faubourgs St. Jacques and St. Marcel, the laying out of the park of Montsouris, the construction of the Hotel Dieu, completion of the central markets and their approaches, erection of the College Rollin on the site of the Montmartre abattoir, completion of the College Chaptal at the angle of the Rue de Rome and Boulevard des Batignolles, construction of a magnificent fountain on the Place du Château, and the termination of the Boulevard St. Germain and of the Rue de Rennes.

MEETINGS FOR ENSUING WEEK.

TUES.—Institution of Civil Engineers.—Discussion on Mr. Sanberg's paper on "The Manufacture and Wear of Rails," 8

WED.—Society of Arts.—"On Courts of Arbitration and the Principle of Co-operation as a means of bringing into Harmonious Action the Interests of Capital and Labour," by T. Beggs, Esq.
Geological Society, 8

FRI.—Architectural Association,—Members' Soiree.
Society of Arts.—Cantor Lectures, first of four Lectures "On Chloride of Sodium, the Products Obtained from it, and their Application to Arts and Manufactures," by Dr. F. C. Calvert, F.R.S.

SAT.—Associated Arts Institute.—Committee Meeting.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

2128 R. SHAW and J. STIRK. IMPROVEMENTS IN BRICK-MAKING MACHINERY. Dated July 20, 1867.

The object of this invention is to construct bricks by a simple and direct acting apparatus, thereby ensuring a durable machine, as well as one that may be worked economically. The inventors effect this by the use of an ordinary vertical pug mill (for disintegrating the lumps of clay), having at the bottom an aperture of about the size of an ordinary brick, and placed over a suitable rectangular table which sustains a shaft having a double ratchet wheel upon it, and driven by suitable gearing. Between the top of the table and the bottom of the pug mill, a space of the depth, say, of a brick, intervenes to permit the passage of a series of moulds placed across the table. The moulds, although close to each other, are in no way connected, but are successively traversed along the table by the action of the ratchet wheels upon projections on their extremities, and each in turn comes under the aperture in the bottom of the pug mill, receives a charge of clay, and is thrust forward by the one behind it, a drag roller rotating on the top of the moulds keeping each in its place. The brick may then be discharged from the mould by being thrust out through a perforated portion of the table upon an endless band below.—Patent abandoned.

2139 E. TOMLINSON. IMPROVEMENTS IN ORNAMENTING, PRINTING, COLOURING, ENAMELLING, STAINING, CUTTING, CREASING, BLENDING, AND MANUFACTURING ARTICLES FROM WOOD AND OTHER MATERIALS. Dated July 23, 1867.

This invention has for its object improvements in printing or placing designs of labels on wood, card, paper, metals, and particularly on wood and scale board, for match or other boxes, which are printed or stamped and cut through at one operation, and for boxes creased and bent, the whole being the result of the same combined action. This is accomplished by placing knives, cutters, or rules made of any suitable material in combination with the printing press, or any suitable machine (either cylindrical or flat pressure), that is, the knives or cutters are fixed in the required position in the forme, or that part that receives the pressure resulting from the action of printing, so that the wood, card, paper, or other material is first cut through and then stamped or printed, and with boxes creased or bent, the whole being the result of the same combined action; or in some cases to perform one or more of the said operations at one and the same time.—Patent abandoned.

2108 J., J., and T. PALMER. IMPROVEMENTS IN MOVABLE SPANNERS OR SCREW WRENCHES. Dated July 18, 1867.

This invention consists in certain improvements in actuating and adjusting the movable jaws of movable spanners or screw wrenches of the kind called Clyburn's spanners or screw wrenches, that is, spanners or screw wrenches in which the movable jaw usually works across the body in a line at right angles, or nearly at right angles, to the handle of the spanner or screw wrench. In actuating the movable jaws of the said spanners or screw wrenches according to this invention the patentees construct and arrange the parts in the following manner:—The bar of the movable jaw works in a recess made across the body of the spanner in the usual way. In the end of the bar of the movable jaw they make a screw box, in which screw box one end of a screw works, the other end of the said screw turning in the body of the spanner immediately under the fixed jaw. A milled collar is fixed by a cross pin or otherwise to the screw. By means of this milled collar the screw may be rotated in one or other direction. A hole is made through the body of the spanner from side to side, in which hole the milled collar is placed and works, the said milled collar being flush, or nearly flush, with the faces of the said body. Instead of placing the milled collar for turning the screw in a hole or recess in the body, one end of the screw may project from the edge of the body, and have a milled head thereon for rotating the screw. By turning the milled collar or head in one or other direction, the screw box of the movable jaw is moved upon the screw in one or other direction, and the movable jaw advanced towards or withdrawn from the fixed jaw on the body of the spanner, and the distance between the two jars is thus adjusted.—Patent completed.

Trade News.

TENDERS.

ABINGDON.—For villa residence to be erected upon the Albert-park, Abingdon, for Mr. Edward Harriss. Edwin Dolby, architect. Quantities not supplied:—

Dover	£1300
Thomas	1088
Selby	1026

HANLEY.—For the erection of a house in Trinity-street, for Mr. Sutton:—

Wooldridge	£669 10 0
Bennett and Cook	514 0 0
Hammersley	489 0 0
Emery (accepted)	435 10 0

LONDON.—For alterations to 55, Old Broad-street, City, for Messrs. Somes, Mullens and Co. R. J. Woodcock, architect. Quantities supplied by Mr. G. Evans:—

Johnstone and Jeanes	£1935 10 6
Gammon and Son	1597 0 0
Carter and Sons	1570 0 0
Piper and Wheeler (accepted)	1524 0 0

LONDON.—For erecting a detached residence and stables at Stamford-hill. Mr. Thomas J. Hill, architect:—

Colls and Sons	£3470
Mordand and Burton	3300
Ashby and Sons	3125
Henshaw	2995
Pritchard	2991
Conder	2948
Webb and Sons	2929

HAMMERSMITH.—For St. Peter's Free School, Albion-road, West-end, Hammersmith. Mr. G. A. Burn, architect:—

Stimpson	£4665
Braithwaite	4617
Dove, Brothers	4140
Adamson	3995
Myers	3938
Mansell	3795
J. and E. Bird	3755
Chamberlain	3687
Scrivener and White	3677

KENTISH-TOWN.—For alterations and additions to Bower Cottage, Kentish-town, to adapt the same as a relief office for district No. 1 and a labour yard, for the Parish of St Pancras. Mr. E. C. Robins, architect:—

Waters	£2400
Keeble	2300
Palmer	2190
Brass	2097
Abbott	2090
Till	2054
Heming	2026
Crockett	2000
Newman and Mann	1996
Crabb and Vaughan	1990
Ball	1988
Nightingale	1873
Lathey, Brothers	1870
Kelly, Brothers	1853
Robert Mann	1850
Nutt and Co	1790
Scrivener and White	1789
Manley and Rogers	1764
Sharpington and Cole	1777
Thomas and Son	1755

LONDON.—For erecting a dwelling house and shop in Old street, St. Luke's, for Mrs Brain. Mr. Thomas J. Hill, architect:—

Chessum	£1167
Rivett	1093
Moreland and Burton	1085
Perry	1031
Henshaw	1020
Enner	971
Sabey	931

LONDON.—For alterations to White Horse Tavern, Fann-street, City. Mr. Thomas J. Hill, architect:—

Deer	£340
Foale	335
Perry	330
Corbelblick	301
Fagg	257

OULTON.—For alterations in, and additions to, Kibbleston-hall, Oulton, near Stone. Mr. C. Lynam, architect, Stoke on Trent:—

Critchlow and Ward	£950
Turner	880
Critchley	860
Jeffries (accepted)	850

PORT-HILL.—For residences at Port-hill, near Bursleim, for J. J. Hancock, Esq., exclusive of outbuildings and boundary walling. Mr. G. B. Ford, architect, Burslem:—

Barlow	£1360
Bowden	1100
Brindley and Critchlow (accepted)	1050

STOKE-ON-TRENT. For the addition of ten rooms to Mr. Lawton's Commercial Hotel. Mr. E. Boon, architect, Burslem:—

Yoxall	£540
Oakley and Minks	525

PROPERTY SALES.

FEB. 24

AT THE MART.—By Mr. Robins.—Leasehold house and shop, No. 132, Clarendon road, Notting Hill, let at £37 10s. per annum, term 80 years unexpired, at £15 per annum—sold for £325.

FEB. 25.

AT THE MART.—By Messrs. Farebrother, Clark, and Co.—Freehold business premises, No. 281, Strand, let on lease at £100 per annum—£1,800.

By Messrs. Debenham, Tewson, and Farmer.—Freehold two houses, with stabling, coach house, and lands, situate in Hill street, Clapton, let on lease at £84 per annum—£1,870.

Freehold premises, No. 23, Broad street, Holborn, let on lease at £75 per annum—£1,050.

Freehold residence, known as The Elms, Bickley Park, with stabling, grounds, &c., 3¼ acres—£6,400.

By Messrs. Wilkinson and Horne.—Leasehold business premises, No 68, Castle street East, Berners street, Oxford street, annual value £40, term 21 years from 1862, at £1 per annum—£320.

Freehold rentcharge of £30 per annum, arising from an estate comprising the Manor of Shipton Sollers, Gloucester, together with the messuages, tenements, farm buildings, &c., thereon—£700.

Redeemed land tax of £10 9s. per annum, charged upon a messuage, and 445 acres of land, situate in the parishes of Shipton Sollers and Shipton Olliffe, Gloucester—£220.

Freehold groundrent of £30 per annum, with reversion in 1897, arising from property in Wapping High street, and Queen's Head alley—£1,180.

Leasehold residence with stabling and pleasure garden, containing about 1¼ acres, situate at Denmark Hill, term 22¼ years unexpired at £30 per annum—£1,500.

FEB. 26.

AT THE MART.—By Messrs. E. Fox and Bousfield.—Freehold house and shop, No. 160, Hackney road, together with workshops and sheds, let at £47 per annum—£915.

FEB. 27.

AT THE MART.—By Messrs. Fuller, Horsey, and Co.—Freehold groundrents arising from houses, &c., in Cordova and Hamilton roads, Mile End, terms 80 years unexpired.—Lot 2, groundrent of £42 per annum—£650.
Lot 4, groundrent of £25 per annum—£400.
Lot 5, groundrent of £20 per annum—£310.
Lot 6, groundrent of £16 16s. per annum—£250.
Lot 7, groundrent of £3 10s. per annum—£50.
Lot 8, groundrent of £28 7s. 6d. per annum—£450.
Lot 9, groundrent of £3 10s. per annum—£50.
Lot 10, groundrent of £10 10s. per annum—£160.
Lot 11, groundrent of £11 14s. 6d. per annum—£180.
Lot 12, groundrent of £25 7s. 6d. per annum—£400.
Lot 13, groundrent of £10 10s. per annum—£150.
Lot 14, groundrent of £10 10 per annum—£160.
Lot 15, groundrent of £3 10s. per annum—£50.
Lot 16, groundrent of £2 10s. per annum—£40.
Leasehold six houses, Nos. 2 to 7, Meetinghouse lane, Woolwich, producing £78 per annum, term 73 years unexpired at £14 12s. per annum—£200.

By Messrs. Ellis and Son.—Leasehold two residences, Nos. 94 and 96, Leighton road, Kentish Town, producing £76 per annum, term 68½ years unexpired at £10 10s. per annum—£810.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Thomas Fortune, Augusta street, Regent's Park, timber merchant, March 16, at 12.—Thomas Ginger, New Barnet, carpenter and joiner, March 12, at 12.—Robert Grant, Croydon, stonemason, March 12, at 2.—William Henry James, Warren street, Fitzroy square, builder, March 10, at 1.—John Wentworth Liddell, Bromley, Kent, builder, March 12, at 12.—Edward Maynard, Chester street, Kennington lane, timber dealer, March 18, at 1.—James William Woolhough, Hoxton square, Hoxton, bricklayer, March 16, at 2.—Thomas Morris Capes, Commercial road, Peckham, builder, March 16, at 2.—Charles Hunt, Harrow road, house decorator, March 18, at 11.

TO SURRENDER IN THE COUNTRY.

John Cole, Chester, March 10, at 12.—James Cooper, York, journeyman plumber, March 11, at 11.—Edward Cowin, Hulme, joiner, March 10, at 11.—George Freeman, Hereford, builder, March 10, at 10.—Adam Lever, Bolton, stonemason, March 11, at 11.—John Scourfield, Liverpool, surveyor, March 13, at 11.—Edwin Walker, Litchurch, journeyman joiner, March 12, at 12.—John Bretherton, Little Bolton, joiner, March 18, at 10.—John Pyne, Exeter, carpenter, March 13, at 12.—David Roberts, Festiniog, joiner, March 13, at 12.—Thomas Shepherd, Worksop, joiner, March 25, at 3.—Joseph Shipley, South Shields, painter, March 16, at 11.—Robert Whitehead, Bradford, plumber, March 17, at 9.15.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

March 27, W. Flood, Southampton street, Pentonville, builder.—March 27, W. Rowden, Portobello road, Notting Hill, painter and glazier.—March 27, J. Starkey, Acton, carpenter and builder.—March 26, B. Wilhams, Rhyl, builder.—March 18, C. Coney, Bournemouth, builder.—March 25, J. Springbett, Cottage grove, Peckham, builder.—March 25, F. Hersee, Old Kent road, carpenter.—April 1, P. Farrell, Salford, builder.—March 19, R. Lillycrap and W. Pearcy, Bursted, Hants, brickmakers.—March 18, J. Coleman, Ewell, surveyor.

SCOTCH SEQUESTRATION.

Donald Forbes, Inverness, house painter, March 9, at 1.

DIVIDENDS.

March 12, J. Best, Seaforth, joiner.—March 12, J. D. Wilhams, Chester, builder.—March 13, J. Heatley, Whitehaven, plumber.—March 17, S. Cole, Cencoed, civil engineer.—March 13, J. Dufton, Birkenhead, contractor.

DECLARATIONS OF DIVIDENDS.

T. Forrest, Wandsworth, surveyor, div. 1s. 3d.—F. H. Green, Lower Norwood and Battersea, builder, div. 2s. 3½d.—J. F. Mathews, Reigate, builder, div. 1s. 6½d.—T. Rose, Buxton, plumber, div. 6½d.

PARTNERSHIPS DISSOLVED.

Stidder and Co., Hanover street, Long Acre, sanitary engineers.—Richards Brothers, Chester builders.—Moorshead and Lett, King's road, Bedford row, architects.—Sudbury and Son, Halstead, builders.—Rennie and Co., Lewisham, railway contractors.—Legan and Co., Macclesfield, railway contractors.—S. and C. L. Norman, Sheffield, builders

THE BUILDING NEWS.

LONDON, FRIDAY, MARCH 13, 1868.

SCENERY AND MACHINERY OF THE STAGE.

NO one can examine the scenery and machinery of the various theatres in London very closely without coming to the conclusion that they present a sorry spectacle. Curiously enough, the houses which have the greatest capacity for scenic display seem to possess the worst apparatus. At Drury Lane, except on very extraordinary occasions, when the management appears to concentrate all its forces, and bring up every reserve for a gigantic effort, the stage appliances are poverty-stricken. Badly painted and dirty drapery, scanty and scraggy sky borders, flats far below the proper height, wretched tree-pieces, with boughs wriggling in strange contortions, no-fashioned impossible furniture, dingy distances, and foregrounds where everything is faulty and faded, cover a huge wilderness of stage, which looks all the more huge and wilderness-like because it is seldom thought worth while to mask the wings, or even to bring the various parts of the scenery and machinery close together. Not long ago the Adelphi was notorious for the badness and incongruity of its apparatus. Playgoers were displeased at having the same scene set before them twice in one evening in different pieces, and many of the properties were strangely dilapidated. Of late matters have been somewhat mended. The same remarks are applicable to the Olympic. The Haymarket has not attempted anything very grand in the matter of scenery for a considerable period, but what little it has accomplished has been poor. The St. James's is in a chronic state of incompetency as respects the matter of scenery. The Princess's is an exceptional house, where great things are occasionally attempted, and sometimes with a large measure of success. No expense is spared, and remarkable skill and ingenuity are evinced in the production of imposing and complicated spectacles. Nevertheless, the scenery here, as almost everywhere else, though effective, is faulty, and fails to produce the full picture. At the New Royalty things are no better. At the Holborn, despite the flattering "opinions of the press" on the Derby-day in the praise-bespattered "Flying Scud," things are done very inefficiently. The Strand struggles valiantly against the difficulties of its very small stage, and, with the aid of some well-painted back cloths, contrives to pass muster very creditably, considering the condition of matters elsewhere. The Prince of Wales's stands out prominently among the many theatres in the metropolis as a house at which a strong effort is made to produce scenes realistic in their character, and of true artistic merit, and it well deserves all the credit which accrues to honest art-labour.

This is not a state of things to be proud of. It reflects no credit on the enterprize of managers, still less does it bear testimony to the extent of their intelligence, while, for the development of taste on the part of the public, it speaks ill. The evil arises commonly from one or more of three potent causes: first, economizing; second, want of knowledge; third, prejudice. Sometimes one and sometimes another of these causes operates most powerfully. Where all three act in concert the result is terrible. The poverty of the confessedly poor excites sympathy, but the poverty of the pretentiously rich gains no pity, and provokes censure. The plea of "limited resources," and the host of equally vain pretences upon which managers occasionally ground their excuses for insufficient expenditure, are wholly inadmissible. To commence the building of a city or the working of a theatre without first sitting down to count the cost is folly. No less inexcusable is the stingy policy which starves a theatrical enterprize, defrauding the stage of its fit and proper appliances, and insulting playgoers with scenes sorrily painted and still more sorrily set. We cannot explain the policy of many of the London managers on any principle except that which points to an overweening love of cutting and scrimping. Managers err grievously when they permit everything to go to rack and ruin in their respective scene-docks and property-rooms, and replace or improve nothing until the clamour of public opinion becomes irresistible. At the Adelphi and Olympic, however, and in a less degree at the Haymarket, certain improvements have been recently effected.

How comes it to pass that of the "new pieces" brought out on the London stage but a very insignificant proportion survive? Managers must certainly have amassed a large amount of experience as to what will, and what will not, please the public; yet they make these repeated mistakes. As respects scenery and machinery, the ignorance which prevails is truly surprising. Else, how is it that scene-painters are allowed to perpetrate such absurd trees as those in the first scene of that marvellous concoction entitled "The Prisoner of Toulon?" Or why, if things theatrical are governed by intelligence, do managers persist in working their scenes from the wings with flats, instead of from above, to the detriment of the general effect and the increase of expenditure? Even at the New Queen's Theatre, where one might reasonably expect to find the most recent improvements, this pernicious practice is in vogue. Why, if experience teaches managers, do they allow flaps on the stage instead of slides, to the annoyance of the audience and the actors? Why do so many managers continue to use sky-borders, and the score of equally absurd appliances which disfigure the scenery and mar the machinery of the stage? It is impossible that any one can examine the effect of these objectionable apparatus from the front without detecting their manifest incongruity—skies cutting off the tops of trees, skies hitched up and carried way by refractory flats, and other little vagaries incidental to the manœuvring of an army of useless contrivances.

The whole subject of stage management needs revision. In the selection of pieces and the casting of characters a radical change is indispensable. The long approved and yet manifestly inconvenient construction of theatrical companies requires to be reformed, and many other departments of theatrical work deserve and call loudly for consideration. Indeed, sooner or later, the whole subject must be submitted to a vigorous inquiry and process of reconstruction. But no department is so urgent in its demands for help as that which includes scenery and machinery.

Within the scope of this topic comes all that is seen on the stage—the place, accessories, and costume of the *dramatis personæ*. It is a large subject, requiring close and accurate inquiry. Before we can stir one step in the right direction, it is necessary to clear the way by a definite and complete comprehension of the causes which have helped to reduce this department of theatrical art to the condition in which we find it. The causes we have now pointed out are the most powerful, and originate the greatest amount of evil. If managers were more liberal or better provided with funds so as to secure the assistance of competent designers for their stage scenes, and better painters and machinists; if, again, they were possessed of more accurate knowledge or had the wisdom to consult men versed in art and archæology; if, moreover, they could pluck out of their minds the pertinacious parasite of prejudice which now saps the life-blood of all originality and genius, there might be hope of improvement. Until these causes have ceased to work, or some vigorous effort is made to destroy or alter them, we see no hope. The scenery and machinery of the stage will remain as heretofore a sorry spectacle, and one which reflects discredit on the art, taste, and intelligence of the country.

THE ST. ANDREW'S COMPETITION, HERTFORD.

IN our issue of January 31 attention was drawn to the competition for this church. The remarks we at that time made concerning the rejection of the previously selected design by the Messrs. Smith, we see no reason to modify; we may, however, say that we have reason to believe that the present competition will be managed fairly. One of the instructions that the site "should be visited by every competitor," and that no block plan would be supplied, although it seems at first sight to point to the ultimate selection of a local man, does not necessarily bear that interpretation. Hertford is but a short distance from London, and no one seriously intending to compete would grudge either the time or money necessary for the visit. Another provision, which requires satisfactory references to be given by the successful architect, is not altogether unreasonable. The committee simply desire an assurance that the successful competitor is able to carry out his design; and that some such assurance is necessary, especially as there is no architect on the committee, is proved by many of the designs which are now being exhibited in the Shire Hall, Hertford. Ninety-four applications for particulars were made, but, though fifteen designs only have been sent, several of this number are by persons with very limited architectural education, who could not possibly carry out the work in a creditable manner. Taking the designs in order, and commencing with that marked "Justice," we must say that a fourteenth century roof is not suitable for an Early English church, though, unless it had been specially described as such, we should not have suspected it. The material is yellow brick banded with red, the spire being covered with slate. The proportion of the piers to the whole height of the church is remarkable. The height to the top of the caps is about 81ft. 6in., while the height of roof above the hammer beam is something like twenty-five feet. The next design, signed "Quis," is certainly not done by an architect, and requires no notice. Another, bearing a device of intersecting circles which form a quatrefoil, is a fair design in the Geometrical style. The interior is lined with brick, a practice prevalent enough at present, though it has, in our opinion, little to recommend it. The spire is of stone. Here it may be observed that the committee left to the judgment of the competitors the choice of materials, and the restoration or removal of the tower. Some of the competitors accordingly endeavour to preserve the tower by new facing it, and adding buttresses. From a careful inspection of the tower, we can safely say that any attempt to restore it would be unwise. It may be left as it is until funds are collected sufficient to build a new one, but, in its present state, it would not bear a stone spire, and the works necessary to strengthen it would cost as much as a new tower. The title "Justicia" is given to a remarkable set of drawings. The author is manifestly no architect, but he has the stuff in him to make a good one. "Hope" is the motto attached to a very fair design, with a new tower and spire. The tower is too low and the spire too high. The columns standing in the aisles are very objectionable: the architect seems aware of this, and has represented them of considerably less size than they would actually be. "Well considered" is worthy of its title; the exterior and interior are both very good. It is, however, to be regretted that the existing tower is utilized. Apart from that there is little to find fault with. "Hope and Faith" is a good design, with much coloured decoration: the removal of the tower is proposed. "Chrysalis and Butterfly" is the appropriate title of a design

which, while retaining a large portion of the existing church, proposes such additions as would cause a complete metamorphosis. The designer does not appear to be an architect. The drawings marked *Deo adjuvante, nil desperandum*, show a very plain church in the Earliest Pointed style. This is a really good design, and, if the tower were higher, little fault could be found. *Tace aut face* is the unfortunate motto of a design which could not have been made by an architect. "All things considered"—in this design the tower is retained, and, as in other cases, very costly alterations have to be made, the spire being of stone. It is surprising that anyone who has seen the tower should dream of new facing it and supplementing buttresses. *Veritas* is the title of one of the worst in the exhibition—galleries are introduced. The committee cannot entertain this design, and the same may be said of another marked *Pro ecclesia Dei*, which has an iron framed roof and apparently iron tracery in the east window. A design marked "M.P.O." is also practically out of the competition. The last set of drawings which require notice are marked with the device "£3,000." There is considerable merit in this design, but the church is too low, in fact squatty. The designer complains of want of time, press of business, &c., and sends an interior of another church as a "specimen of the description of roofs there would be in nave and chancel." He requests this drawing to be withheld, but his request has not been complied with. In conclusion, we may say that the choice lies between "Quatrefoil," "Hope," "Well considered," "Hope and Faith," and *Deo adjuvante, nil desperandum*. The decision will be given about the end of the month, and we sincerely hope that it will be impartial and satisfactory.

GLASS PAINTING.*

ANCIENT painted glass attracted very little attention in this country previous to the time of Horace Walpole, who is entitled to the credit of bringing it into favourable notice. The actual revival of the ancient system is principally due to Mr. Miller and Mr. Willement, two eminent glass painters of their day, the latter of whom was the first to distinguish and mark out the different styles with which we are now familiar. The late Mr. Charles Winston, though only an amateur in the art, was a very distinguished one. Indeed, few amateurs in any technical subject—if we except Mr. Ruskin for instance—have accomplished so much towards its elucidation and advancement as did Mr. Winston, in the art of which he was so enthusiastic a student. A barrister by profession, and holding a highly respectable position in that profession, he devoted the leisure of more than thirty years; and with his time his means, to the study of glass painting, for which, we may add, his highly cultivated artistic taste and remarkable industry eminently fitted him. He gave the result of his labours to the world in his well-known "Inquiry into the Difference of Style observable in Ancient Glass Paintings," originally published in 1847. We gladly welcome, after a lapse of twenty years, the appearance of a second edition of this work. The death of its author, which happened suddenly from an affection of the heart, in October, 1864, was a great loss to art, and especially to that art which he had laboured so assiduously and so successfully to foster and encourage. In the Building News of that date will be found an estimate of his labours, and a tribute to his memory. In again noticing the two handsome volumes before us, it may be observed that, with the exception of several additional notes and references, and a few verbal corrections, which appear in the new edition, the work remains substantially the same as its author left it. The object Mr. Winston had in view was to investigate the varieties of ancient glass painting, and to reduce them to a few classes or styles in the same manner as has been done with regard to Gothic architecture. In the first volume, accordingly, a classification of this kind has been made, the second volume being devoted to a series of illustrations of the best known examples of glass painting from the author's own drawings. A number of these represent both the design and colouring of the original—all the drawings are copied from genuine examples—and the value of these plates may be judged from the fact that they form a tolerably connected series of paintings from the thirteenth century to the seventeenth century. The reader need hardly be reminded that the difficulty of producing in a plate the *effect* of painted glass has never yet been overcome, even in engravings of large size. The spirit and fidelity which characterize Mr. Winston's drawings generally are remarkable, and they have been admirably executed by Mr. Philip H. Delamotte. The beautiful window painting from Little Malvern Church, Worcestershire, is particularly rich and effective, and is an important addition to the new edition. On the general subject of painted glass, a few brief notes, based on the researches of Mr. Winston and others, may be useful to the student. We are inclined to agree with Mr. Winston in thinking the term "painted glass" the more correct expression than "stained glass." For a glass painting, as he observes, may be entirely formed of painted glass—that is, glass painted with an enamel colour—but it would be impossible to execute a glass painting merely by staining the glass. Most glass paintings are formed by combining the two processes of enamelling and staining; and, moreover, as regards colour, the same general principles apply to glass painting as to any other. Our great teachers, the Egyptians, were acquainted with the art of glass blowing upwards of three thousand years ago. They made glass both white and coloured, opaque and transparent. The exact date of the application of glass painting as an art is uncertain, but we know that it was in vogue at least as early as the tenth century. The different varieties or styles of the art which have successively prevailed in this country have been arranged under five classes. There is, first, the Early English, which extends from the date of the earliest specimens extant to the year 1280. Then followed the Decorated style, which flourished for the next hundred years. One of the most distinctive features of this style is the natural form of its foliaged ornaments. It was superseded by the Perpendicular style, but the exact date cannot be fixed with certainty, the change being a very gradual one. The Perpendicular windows, however, are easily distinguishable from the Decorated by the form of their details, the greater breadth and delicacy of their colouring, and their more refined and finished execution. Mr. Winston assigns about a century and a half as the period of its duration, being of opinion that it terminated with the use of Gothic ornamental details about the year 1530. This, in its turn, was succeeded by the Cinque Cento style, so called from the ornaments of this style of glass painting resembling those of the Italian architecture of the sixteenth century. It prevailed for about fifty years, or until the introduction of the "Mosaic Enamel mode" of glass painting, about the middle of the sixteenth century. This style is considered more ornamental and less severe in its character than the Perpendicular, though the early Cinque Cento examples bear so striking a resemblance to the contemporaneous Perpendicular windows that it is not always easy to distinguish them. The change in this case also was very gradual. The decade between 1525 and 1535 Mr. Winston calls the golden age of glass painting, the gorgeous Cinque Cento style having then reached its perfection. The Intermediate style he dates from the middle of the sixteenth century to the present time. This style, from its long duration, includes many varieties. These the author of this work classes under two heads; the first comprising the glass paintings executed between 1550 and the revival of the Mosaic system, which took place some forty or fifty years ago; the second those which have been executed since that period. Mr. Winston goes minutely into each of these five styles, describing their leading characteristics, and examining their various details and modes of treatment, in a series of chapters and sections. The vast amount of information given, and the clear and systematic manner in which the author treats his subject, apart from the critical opinions which he expresses—with which some doubtless may not always agree—make the work a most valuable text-book alike to the artist in glass painting, the student of architecture, and to the archæologist. We shall on another occasion enter more critically into glass painting as an art.

* "An Inquiry into the Difference of Style observable in Ancient Glass Paintings, with Hints on Glass Painting," by the late Charles Winston. Second Edition. Parker and Co., 1867.

ROYAL SCOTTISH ACADEMY'S EXHIBITION.—ARCHITECTURAL DESIGNS.

(Communicated.)

WE regard the present exhibition of drawings with mingled feelings of disappointment and hope. Disappointment, that the exhibition should receive so few contributions from good authors, and hope, because in the designs of some we can distinguish the germs of good things in store for architecture. There is at present great disorder in the architectural profession. Our architects announce that they will design in any style, from Egyptian, or Grecian, to the latest phase of Gothic, whether it be a shop-front or a cathedral. In fact, they profess to be able to do what in any other profession or trade would be divided among twenty men. Take painters, for example, whom we have divided into landscape, figure, portrait, and animal painters, and we have men celebrated in each division who could not paint well in any other. Why, then, should architects not also be divided into church, mansion, and house architects? For, if we do not expect that landscape painters should be equally good at figure and portrait painting, how can we expect a church architect to be equally good at designing mansions, public edifices, or tenements, in any style? In order that this anomaly in the profession may be more clearly pointed out, we will draw attention to it as we proceed. We will go over the churches first, then the mansions, and, lastly, the tenements.

(118) and (162) are two designs, by David Bryce, R.S.A., for the St. George's Church, Edinburgh. The former is Classic, and resembles a bank or insurance office; the tower is merely two of his cupolas on the Bank of Scotland put on the top of one another. The latter is Gothic, but of a very debased kind: the tower is a copy of the old church tower, Dundee, and the spire is a very bad copy from St. Giles's. Now, although Mr. Bryce stands pre-eminent among Scotch architects for large mansions in the Scotch Baronial style, and large Classic edifices, like the Bank of Scotland, yet it is well known that he cannot design churches, for he has erected very few, and they are not considered good. For his own credit he should refuse churches, and trust his reputation to mansions, for architects have, or should have, reputations to maintain as well as artists. J. T. Rochead, of Glasgow, also sends two churches. (123) is a design in the Early Pointed style, which has a lofty and beautiful appearance; but the spire is too bare, and presents a miserable contrast to the rest of the building. (103) is a design in mixed Moorish and Lombardic styles. From this and other designs by the same ar-

chitect in last year's exhibition, it is evident that, like some more of our Scotch architects, he is satisfied that Gothic, as it now exists, is not to be the future style for Britain, and he is groping his way to another. It is curious that all the present endeavours after something new, land in the semicircular arch, or some variation of it, as the leading feature. If one may judge from passing appearances, the pointed arch will form no characteristic feature in the architecture of the future. From Mr. Rochead's design it is evident that something might be made out of it. The horse-shoe arch might be used with advantage. It is not to be expected that Mr. Rochead would be successful in his first attempt at something novel; he has borrowed too completely. We can no more expect Turkish Mosques to become general, than we could expect Turkish flowers to grow and propagate amongst them without protection. (211) Free Church, near Edinburgh, by J. W. Smith, has originality and neatness to commend it. (231) by the same architect, Church at Dalkeith, is also creditable. (120) United Presbyterian Church, Newtown, St. Boswell, by John Paterson, has not much to recommend it, except the red stone rubble work. The apse is ungainly, and the small tower is far from pretty. A small church, in our opinion, should rather have dignity and simplicity than prettiness. (57) Design for Free High Church, Partick, by John Honeyman, jun., Glasgow, has a very good chancel, and the best advantage seems to be taken of the sloping ground; but the square spire spoils the general effect. It is curious that people will not take warning from the experience given them by others. Square spires always look ill, and, from their very construction, must look ill. Architects, moreover, never seem to think that a spire can be built in any other way than by a continuous taper from the top of the tower to the vane. Those Classic churches built a hundred years ago, or more, might at least teach us a very useful lesson in breaking up our spires. We never saw or heard of a round spire, and yet we think it would look very well. (194) Church of St. Michael and All Angels, Helensburg, by Robert Anderson. This has a large hideous tower and spire, without shape or design. It could have been most beneficially spared in order to adorn the rest of the edifice, which has windows in it that resemble stable openings. No church seems to be considered complete by a congregation unless it has a spire, but if those in the exhibition are to be taken as specimens of those erecting throughout the country, the less we have of them the better. Unless an architect has sufficient money to make a good spire, he should be content, and try to make his clients content, with a neat spirelet rising from the gable. (210) by the same architect, Interior of the Church of St. John the Evangelist, Alloa, shows that he is better at interiors than exteriors. (42) United Presbyterian Church, North Berwick, Island of Craig, Leith, and Firth of Forth in the distance, by R. R. Raeburn. This is the worst architectural design in the rooms. The background is decidedly the best of it. The angle buttresses in front have a most uncouth and clumsy termination. (160) Improvement of the choir of St. Giles's Cathedral, by Robert Matheson. The principal improvement is the erection of stalls all round the choir, an absurdity in a Presbyterian church, and a mere sham. If the cathedral were in the hands of an architect who knew more about Gothic, the edifice could be ornamented in a more effective manner with less money. Although Mr. Matheson made a good job of the Classic Post-Office, it does not necessarily follow that he is able to improve a Gothic cathedral. (270) Greenfield Church, Dundee, by Frederick J. Pilkington, is the most beautiful building exhibited. The grouping of the different parts, the beauty of the skyline, and the taper of the spire are all that could be desired. The design is in his own peculiar style, Continental Gothic, used freely with a mixture of Moorish and semicircular arched windows. For boldness and originality, his churches cannot be surpassed by any in Scotland. Although Mr. Pilkington was very much cried down at first, yet the public are now beginning to appreciate and encourage him.

We now come to the mansions. (192) Langton House, Berwickshire, by David Bryce, R.S.A., has a noble and handsome appearance, and is decidedly the best exhibited. There is a lightness and cheerfulness about it caused by a plentiful supply of windows that makes us prefer it to many of his Scotch Baronial mansions, where windows are at a discount. It is Elizabethan, however, and we think that that style should be left to the Elizabethan age; for architecture, like everything else, was meant to progress, and we should no more design as they did 300 years ago, than we should write, compose, or paint as they did at the same time.

(249) Kingsknowes House, Galashiels, by Wm. Hay, is a very good building in the Scotch Baronial style, with a sufficiency of windows to make it a convenient and comfortable dwelling for the present time. Some maintain that it is debasing Scotch Baronial to erect a building in that style with many windows in it, because our old castles had few windows. But the cause for that it is not difficult to find in those warlike times; it suited their comfort and convenience to have it so. For our comfort and convenience many windows in our rooms are necessary, and yet unthinking architects will not supply us with them. If it is necessary for Scotch Baronial buildings to have few windows because old castles have few windows, then we think it also necessary for them also to have stone roofs, stone floors, 10ft. thick walls, and many other things that old castles have. (61) House at Westoe, Durham, Douglas and Stevenson, is a very neat dwelling, with pointed windows, but the bare walls and want of windows give a dead appearance to the whole, which is only slightly relieved by the red rubble with yellow stone dressings. (228) Mansion at Walkerburn, Pilkington and Bell, has a better skyline than their mansions usually have, and shows a boldness and originality characteristic of all this firm's productions; but the conservatory at entrance is too conventional, quite unlike their style and the rest of the building. (84) House, Queensferry-road, although too much like a swelled-out villa, shows that R. R. Raeburn is better at houses than churches, and that it would be better for his credit if he kept to them. (159) by the same architect, is so miserably plain that one wonders why an exhibition drawing should be made of it. (148) Villa at Dean, by George Beattie and Son, is a plain substantial edifice, with little attempt at design. This is the only villa exhibited, and, as there are hundreds springing up all round Edinburgh, it says little for their general appearance when architects are afraid to exhibit them. Villa architecture is too much neglected. It is a kind of building that has only lately come into fashion, and it says little for our architectural taste that we have made so little of it. We hope to see a number in the exhibition next year. (100) Treame House, Ayrshire, Peddie and Kinnear, is a very picturesque and well grouped mansion. The only objection is that the massive square tower seems out of keeping with the broken-up roofs and the sharp-pointed gablets and gables of the other parts. As shown here, a very effective appearance might be made by barge-boarding and overhanging roofs. We are astonished that they are so little used in villas. (81) Hotel at Roslin, E. A. Sutter, C.E., resembles stables and lofts more than a hotel. (20) Competition Design for a Workmen's Institute, W. D. Dobson, looks more like a double villa, and would answer that purpose better. (144) Eastbourne House, Portobello, by J. C. Walker, is in very bad taste, and has a furniture look.

We now come to the tenements. (16) Tenements, Heriot Mount, by R. T. Shiells, are situated on an eminence overlooking the Queen's Park, and for this reason the architect thinks that his buildings should be Scotch Baronial, and, being Scotch Baronial, that they should resemble a castle. Evidently one of the first principles of architecture is to make a building look like what it is intended for—that a church should look like a church, and not a bank or barn. Yet how often do we meet with gross violations of this rule! (153) Street Buildings, Castle-terrace, is designed upon geometrical principles, the proportion being multiples of 2 with 45 deg. angles on face plan, and 67½ deg. on elevation, James Gowans. There is a boldness and originality about these that commends them, and some parts will look better in execution than on the drawing, which is very feebly done. Mr. Gowans would design better if he did not tie himself so closely down to geometrical principles. (154) New-terrace, Murrayfield, by Pilkington and Bell, shows the usual originality of the firm's designs, whether they be cheap or costly. Whatever they do, they seem to make the most of; some architects grumble because they do not get a sufficiency of money to make a good job. The test of a good architect is not in making a good building with an unlimited amount of money, but in making a good design with little money. We are sorry we cannot say so much for (273), Selected Design for Easter Club House, Dundee, by the same architects. There is so much of a conventional treatment that is so repugnant to their natural style, that we hope they will not continue it. The conclusions we come to, from a survey of the designs, are these—that architecture in Scotland is in a backward state; that there is a feeling for some fixed national style which we hope may continue; that more attention ought to be paid to villa architecture; and that to improve, our architects must be divided into sections, as proposed in the commencement of this article.

PUGIN *v.* BARRY.

THIS subject has been the topic of conversation in architectural circles during the past week. Old-fogeydom, that sneered at the pretensions raised in A. W. Pugin's favour a few days since, is now dumb-founded. We cannot find room for all the letters sent us. One will be found in another column. Another correspondent, who enjoys a well-won reputation, says, "I must congratulate you on the extraordinary turn of the controversy by Herbert's discovery of A. W. P. Everybody to whom I have shown the photograph is astonished at the audacity of Mr. C. Barry pretending to deny the existence of the A., and, still more, pretending that W. P. meant Prince of Wales. I confess I was staggered by some things in Dr. Barry's pamphlet; but equally struck with the rottenness of his defence about the 76 letters, which I had all along fixed upon as the fatal blot in this case. * * * I wonder whether the 'Pall Mall Gazette' will have the honesty to retract. Of course the 'Builder' won't." Another correspondent, a well-known architect who knows nothing of E. W. Pugin, says, "I have been 25 years incessantly engaged in architectural drawings, and might be justified, I think, in styling myself what the newspapers terms an expert. In the first place, the drawing in its careless exactness shows Pugin's authorship. If Pugin had been gifted with prophetical powers he could not have shown more wisdom than he did in this his sign manual. The section having three spaces would naturally suggest his own initials, and, being at the side of the drawing, where they were not likely to be noticed, he claps them in. But he does not repeat them elsewhere, nor does he put the initials in the front. If, as the Barrys say, the letters refer to a member of the Royal family, it might certainly be expected the panels *in front* would have them. Augustus Welby Pugin we know, but who is Albert Wales Prince? It is preposterous for the Barrys to say that any ordinary draughtsman would be competent to

make correct details from this drawing. It is suggestive enough, but requires an equally clever man to translate it into, so to speak, the vulgar idea of working drawings. If such a drawing were given to twelve different assistants to work independently of each other, you would get twelve sets of details with little or no resemblance to one another. Another correspondent says, "If the Barrys had not resorted to a subterfuge in trying to show that A. W. P. stood for the Prince of Wales, the world would have sympathised with them. But it is now apparent that they are more interested in vindicating their father's name than of defending truth. Before this discovery of Mr. Herbert's I saw an old drawing of A. W. Pugin's in a bookseller's window, and I was struck with the exact resemblance of that drawing and the photograph which served as a frontispiece to Barry's pamphlet. If, as Mr. Herbert says, the late Mr. Pugin was in the habit of dropping his initials into all kinds of plans in drawings of furniture, metal work, &c., most likely it will be found that these initials will be similar to those fixed on the design for the throne. There is an unmistakeable individuality about a man's initials as there is about his signature; and, if it can be shown that the letters A. W. P. in the throne resemble Pugin's initials in his other designs, that will settle the controversy beyond the possibility of dispute." Another correspondent says, "I have reason to believe that the Barrys have called in their pamphlet. I also hear that Mr. Powell, of Birmingham, intends to bring out a pamphlet on the subject."

PUBLIC HEALTH IN EAST LONDON.

WHEN the cholera visits us again, will it find us unprepared and panic-stricken? We fear so. The immediate danger passed away with the year 1866, and has been well nigh forgotten in the efforts that have been made to overcome the still more dangerous because apparently chronic disease that succeeded it in its own peculiar field. Starvation has struck down its thousands in East London, where cholera only destroyed hundreds, and, under the weight of the new calamity, the memory of the old one is almost obliterated. Yet distress has this advantage over disease, we can sometimes trace and so remove the cause. With cholera it is different. It comes upon us almost unforeseen, we are ignorant alike of its origin and cure, and it leaves us sadder but little wiser than when it came. Thus, we look with satisfaction on all efforts made to discover the deadly secret. Mr. Orton, the medical officer to the Limehouse Board of Works, has just issued his Report for the year ending Lady Day, 1867, with supplementary remarks on the cholera epidemic in the East of London. He is certainly rather late in the day, but he pleads in excuse the many authorities he has had to consult, and the advanced season of their appearance. He has been at some pains to examine into the different theories started on the subject, and the arguments by which their supporters seek to maintain them. His own opinion is that the primary cause of cholera was atmospheric, that it originated in the East, and, after a lapse of months, having traversed the Continent true to the westerly direction, it found its way to England, when East London terribly felt its shock, resulting in an extraordinary mortality, mainly attributable to masses of filth in various forms, traceable to docks, canals, sewers, &c., and to such a degree as not to be equalled by all the rest of the metropolis. That, after the evolution of deadly vapours and gases from this accumulated filth in the hot season, during an almost perfect calm for several days, a continuous wind, with slight variations, chiefly N.E., conveyed the poisonous air direct through the heart of the cholera field, which happened to be tolerably co-extensive with that of the East London Water Company's sphere of supply from their works at Old Ford. He believes that, owing to the intensely high temperature in the latter part of June and beginning of July, there would, in the ordinary course of things, have been a great accession of fever, for which, in fact, he was preparing, but a special atmospheric poison coming gave the sickness another turn, so that large numbers of persons under certain conditions were carried off by cholera. The number of deaths from general causes, apart from cholera and diarrhœa, during the period embraced by the report was 11 per cent. less than during the previous year. The amount of fever was 20 per cent. less. These facts further induce him to regard cholera as specially a destroyer among the fever haunts, and in some way or other as a substitutionary or vicarious disease. He is satisfied that foul water had nothing to do with originating or even exaggerating the epidemic, and supports his conviction by adducing instances of many large institutions and manufactories where nothing but the supposed impure water was drank, and few, if any, deaths occurred. He submits several practical propositions to the public, calculated to prevent or at any rate to check a future attack. He believes that the daily evolution of millions of cubic feet of noxious gases from the main outfall did not fail to enhance the pestilence, and suggests that the air-shafts should be more efficiently ventilated or means be adopted to destroy the exhalations as they rise, that the sewage from the West Ham pumping works should be pumped into the Bow Creek only at ebb tide, and that it should be diverted as soon as possible into the main outfall; and that the refuse of factories and sewage, as far as possible, should be rigidly prohibited from passing into the Lea Cut and Regent's Canal, as injurious to the public health.

FIRE-PROOF CONSTRUCTION.

IS it possible to construct a building really fire-proof? asks "The Engineer." The shell or staircase, and the roof covering, of all at present erected are so, in conformity with legislative regulations, but the internal arrangements are left entirely to the builder. To ensure the complete incombustibility of a structure, it should be composed altogether of fire-proof material. Any portion of it, no matter how trifling or apparently insignificant, consisting of substance not so constituted, is an element of weakness, of danger, and perhaps of ultimate destruction. It will be urged that a structure of this character is an impossibility, that we cannot have iron doors, iron window-frames, and iron flooring in our ordinary dwellings. While we do not admit the validity necessarily of this "*non possumus*" argument, yet we will concede the point; but, at the same time, maintain that a great deal more might be done to prevent the contingency of conflagration, especially in the construction of those particular classes of buildings which are peculiarly liable to suffer from such a cause. Probably none are so exposed to the chances of being ultimately consumed as theatres, and places of evening amusement and recreation. It almost appears as if the exertions of the builder and architect were directed solely towards the best means of extinguishing a fire, instead of aiming at the possibility of preventing its occurrence. The recent total destruction of the Opera House demonstrated how theatres can burn, and the scenery and stage no doubt assisted very materially to feed the flames. We see no reason why this part of the interior of a theatre might not be cut off at will from the rest, and the introduction of iron in other portions, to the total exclusion of timber, would be attended in the long run with other than merely precautionary and economical advantages.

The danger of adopting a compound system of construction, part fire-proof and part inflammable, was shown the other day by the fire that occurred in the Charing Cross station, and which consumed the customs and luggage office, and destroyed the sheeting in a couple of bays of the roof, besides doing a large amount of damage in the item of broken glass and general disfigurement. One cannot help observing how extremely injudicious it is to jeopardise not merely the station roof, but the hotel itself, by the erection of so large a mass of inflammable material in close proximity to them. Had the fire occurred under less advantageous circumstances with respect to time and weather, in all probability it might have reached the hotel. The point to which we desire to call the attention of our readers is the construction of the roof. So far as the girders or ribs are concerned they are of wrought iron, but the louvre, running the whole length of the station, is of wood, and so also are the sides of the roof at the springing for about a fourth of the distance between it and the ridge. The fire originated at the entrance to the station, upon the bridge in fact, and manifested that, if unchecked, it would have reached the hotel, by at once seizing upon the timber portions of that bay of the roof nearest it. In reality it would be difficult to imagine a more convenient route for it to follow, and, metaphorically, if the hotel were to represent a fort to be blown up, the timber sheeting along the roof might be compared to the train of powder, and the fire that originated at the end, to the igniting spark. To make a sound and durable roof whenever zinc or slates are employed for the external covering, there is no question but that an under-sheeting of at least inch boards is necessary, and the same arrangement should be adopted when very thin plain sheet iron is used, although the last-mentioned covering can be fixed upon wrought-iron laths. The employment of cast-iron, which, however, makes a very heavy roof, or that of strong corrugated iron, would obviate all necessity for wooden sheeting, especially in a large station roof, where the preservation of an equable temperature is not essential. With the exception, perhaps, of some of the magazines and stores attached to the various ordnance depôts, there is scarcely a roof that can be regarded as absolutely fire-proof; they all contain in themselves not only the seeds of self-destruction, but the capability of extending that destruction to neighbouring objects. The establishment of large reservoirs and tanks, the connection with the water mains, and the organization of a complete system, with all its attendant paraphernalia of buckets, hose engines, and plugs for the purpose of extinguishing fortuitous conflagrations, are an indispensible portion of the management of all cities and towns. But we wish, while recognizing the value and efficacy of our fire brigade, that those engaged in the practice of architecture and construction would endeavour to design their works in a manner that would render its services as nearly as possible unnecessary. The usual means adopted for the extinction of fire have repeatedly failed to save the immediate object attacked, and are at the best chiefly effective in checking the spread of devastation. Prevention is better than cure, and, although so long as we acknowledge the evil we must always be prepared with a remedy, yet the wiser course is to endeavour to need it as seldom as possible.

MANCHESTER TOWNHALL DESIGNS.

ANNEXED is the report of Professor Donaldson and Mr. G. E. Street, the consulting architects to the Corporation. The principal recommendation contained in the report, in favour of the designs of Mr. Waterhouse ("St. Valentine"), having been already made public, there appears to be no longer any reason to withhold the document itself:—

(Copy.)

London, March 3, 1868.

Dear Sir,—We have been honoured by the instructions of the Townhall sub-committee for the erection of a new Townhall in the city of Manchester, dated the 20th February last, and conveyed through you, requesting us to furnish our opinion generally on the plans sent in by the eight competing architects, and especially with reference to the matters therein specified. (Mottoes of Designs:—1. "Arnolfo di Lapo;" 2. "Faire sans dire;" 3. "Fides;" 4. "Sperandum;" 5. "St. Valentine;" 6. "Masons' symbol of crossed triangles;" 7. "True to the line;" 8. "Valentine.") We have accordingly examined, with very great care, the several drawings, and read the explanations of their designs drawn up by the architects, and we beg to report as follows:—

1. As to the comparative merits of the designs in an architectural point of view, having regard to the form of the site, the lines of the adjacent streets, the climate of the district, and the purposes for which the building is required, we are of opinion that the designs No. 6, No. 4, No. 7, and No. 5 are, as works of art, the finest designs of the whole series; and, with regard to relative merit, may be considered to stand in the order in which we have here placed them.

2. As to general arrangements and convenience, having regard (amongst other matters) to the simplicity of plans, the facilities of access to the different parts of the building, the entrances for the different streams of visitors, the position and convenience of staircases with a view to the avoiding of unnecessary walking inside the building, the provision made for setting down and taking up visitors arriving or departing in carriages, and also for the entrance of carts, and for the loading and unloading thereof; also the convenience and character of the mayor's reception rooms, and the arrangements made for keeping the same distinct from the business portion of the building; and also whether the whole of the accommodation asked for by the corporation has been provided, and the extent of unappropriated space; we are of opinion that the first place ought decidedly to

be given to No. 5, the two next best designs being those of No. 6 and No. 8.

3. As to the sufficiency of window light supplied throughout the building, we consider the designs of No. 5 best.

4. As to the provision made for ventilation and warming, we consider that all the designs would admit of the adoption of proper artificial systems of warming and ventilation; and that, owing to the open arrangements of the internal courtyards in this plan, the design of No. 5 would be best as regards natural ventilation.

5. As to the acoustic properties of the large hall or room and the council chamber, we are not prepared to give any decided opinion on this head.

6. As to the cost of the design, and the probability of the same being carried out for the amount stated by the architect, we are of opinion No. 5, No. 8, and No. 7, are the least costly of the designs submitted, and that the expense of carrying either of them into execution would probably not exceed the sum named in the instructions to the competing architects.

The conclusion at which we have arrived, after a careful adjustment and comparison of the various designs, on the ground of architectural merit, construction, excellence of plan and arrangement, light, cost, and provision of spare room, is, that the four best designs in order of merit are—1st, No. 5; 2nd, No. 6; 3rd, No. 4; 4th, No. 7. And we both concur in recommending that the design marked "St. Valentine" (No. 5) should be recommended by the sub-committee to the Mayor and Corporation for adoption. The architectural character of this design is, as we have said, not so good as some of the others, but the plan has such great merits, is so admirably and simply disposed, and so well lighted, that we cannot but feel that it is thoroughly entitled to the first place. The general disposition of the masses of the elevation is very picturesque, and there is much dignity about the treatment of the principal storey towards Albert-square. We are bound to say that in some respects the design appears to us to require additional study and modifications, of which it admits without difficulty. The great entrance requires better apertures, more light, and greater dignity, and the design for the clock-tower and the angles of the front towards Albert square will, doubtless, be modified and improved by the architect, before they are carried into execution. We regret very much that the interior courts of this building (as indeed those of almost all the designs) have not been more carefully designed in regard to their appearance. They will be seen by most visitors to the building, as the whole of the corridors open upon them, and, as they are all as spacious and open as could be contrived on the site, it seems a fatal mistake to leave them entirely unadorned. Good, solid, simple, but really architectural character is what they require, and there is no reason why they should not have it. The character of the whole building as a work of art depends very much upon its being uniformly good throughout.

We cannot conclude without saying that all the competitors appear to have bestowed immense pains on their designs for this very important work, and that the requirements contained in the instructions appear to have been generally very carefully attended to.—We remain, dear sir, your very faithful servants,

(Signed) Thos. C. Donaldson,
George Edmund Street.

To Jos. Heron, Esq., Town Clerk of Manchester.

We give the names of the competing architects whose designs are referred to by the mottoes or symbols only in the above report of Professor Donaldson and Mr. Street. 1. "Arnolfo di Lapo," Mr. Cuthbert Brodrick (architect of the Leeds Townhall); 2. "Faire sans dire," Mr. T. H. Wyatt (architect of the Liverpool Exchange); 3. "Fides," Mr. Lee (London); 4. "Speraudum," Mr. J. Scott (London); 5. "St. Valentine," Mr. Waterhouse; 6. The Masons' symbol of crossed triangles, Messrs. Speakman and Charlesworth (Manchester); 7. "True to the line," Mr. Thomas Worthington (Manchester); 8. "Valentine," Mr. Salomons (Manchester).

ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of this society was held on Wednesday, at the rooms of the Royal Institute of British Architects, 9, Conduit-street, Sidney Smirke, Esq., R.A., in the chair. After a few introductory observations by the chairman, the balance-sheet was read. It showed that in round numbers the receipts for the year, including £104 13s. 6d. carried forward from the previous account, amounted to £366, and the disbursements to £319, leaving a balance of between £40 and £50 in hand. The amount of stock (New Three per Cents.) was, on December 31, £1,367 15s. 8d. The report, which was also read, expressed the regret of the committee of management that the receipts for the past year had not increased to enable them to do all the good they desired. Fourteen applicants had been relieved, but several pressing claims were rejected from the want of funds. Since the last report eighteen new members had joined. The report concluded with a graceful allusion to the loss the society had sustained by the death of Sir R. Smirke, and an appeal for increased subscriptions. The report and balance-sheet were adopted. The formal business of electing officers having been gone through, several votes of thanks to officers for their services in the past year were recorded, and the proceedings closed.

A CHURCH ON FIRE.

THE parish church of Wembdon, near Bridgwater, was burnt to the ground on Sunday morning last. With the exception of the tower and the chancel, the building was completely destroyed, together with an organ almost new, and a beautiful carved oak pulpit. An overheated flue was the cause of the fire. Singularly enough the fire broke out during divine service. It is with churches as with theatres and all other public buildings, it is very seldom that they take fire while an audience is assembled, but almost invariably after the audience has dispersed. In the present case, however, the vicar had just given out his text, when a loud knocking was heard at one of the doors, and, on its being opened, a person, who at a distance had observed smoke issuing from the roof, presented himself and exclaimed, "Make haste out, the church is on fire." As might be expected, great consternation prevailed in the congregation, who were, of course, utterly unconscious of their imminent danger. No fire or even smoke was, at this time, observed inside the building. The worshippers hastily left their seats and got outside into the churchyard, when it was seen that the roof was in a blaze. The whole affair appears to have been of a dramatic and highly exciting character. It is satisfactory to add that no loss of life occurred.

NEW RAILWAY WORKS.

THE contract in connection with the new line of railway from Lewisham to Tunbridge was originally taken by Mr. John Jay, whose tender of £600,000 was within the parliamentary estimate, and the other tenders received extended to £850,000. Mr. Jay, however, was unable to complete his contract, and the works have been carried out under the superintendence of Mr. Peter Asheroft, the engineer-in-chief of the South-Eastern Railway Company, Mr. F. Brady, the resident engineer, and their assistants. The works, generally, are the heaviest executed in England of late years. The embankment at Orpington is 80ft. high, and contains about 800,000 cubic yards of earth work. The cuttings at Chelsfield are very heavy, and are of a somewhat similar character to the Merstham cuttings on the Brighton Railway, except that they are much longer and deeper, and they contain about 820,000 cubic yards. There are also three tunnels between Chislehurst and Tunbridge, that at Chelsfield, through the chalk range, being about 600 yards in length; the Polhill tunnel, about a mile from Chelsfield, and also through the chalk, is upwards of 2,500 yards in length; and the Sevenoaks tunnel, which is through the green sand range, is 3,550 yards, or over two miles in length. This last tunnel was found to be a work of extreme difficulty, in consequence of the great quantity of water met with in sinking the shafts.

THE MANSION HOUSE.

THE four months that have elapsed since the election of the present Lord Mayor have been spent in repairing and restoring his official residence. The work has been carried out under the supervision of Mr. Horace Jones, the city architect, at a cost of above £3,000. The principal part of the expenditure has been devoted to the interior adornment of the Egyptian Hall. It may not be generally known that this room was designed by the then Earl of Burlington, and derives its name from its accordance with the Egyptian Hall designed by Vitruvius. The hall has been decorated in strong colours, the columns and prominent ornaments being relieved with gold, and the niches kept in dark marble, thus throwing out the sculpture in bold relief. The walls, cornice, and frieze have ornaments in the character of the architecture of the hall. The saloon has been embellished in light delicate colours and gold, but in a different manner from the hall, with a view to contrast. The erection of the Mansion House, which stands on what was anciently called the Stocks Market, was begun in 1739, in the time of Lord Mayor Perry, and finished in 1753, in the mayoralty of Sir Crisp Gascoyne, the first chief magistrate who resided in it. The architect was the elder Mr. Dance, who was then the city architect, and the fabric was built at a cost of nearly £71,000. The previous Mansion House was situate in Cheapside, immediately opposite Mercers' Hall, and the front of it, in a fair state of preservation, may still be seen.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

A VERY interesting meeting of the members of the above society took place at their rooms on Monday evening. Mr. French read a paper on the maces belonging to the corporation of Stratford-on-Avon; and in the discussion which followed, some valuable suggestions were offered respecting the origin of maces as the insignia of civil authority. Mr. Brogden exhibited the 7,000 coins which one of his gardeners recently discovered in his grounds at Highbury. With the exception of two, which are of gold, they are all of silver, and from the fact of there being none later than the reign of Richard II., it is surmised they were buried for safety by the Knights of St. John, to whom the estate then belonged, at the time when Wat Tyler's mob attacked and pillaged their house in Clerkenwell. Mr. Clark offered some further remarks on the Roman sarcophagus recently discovered near the Clapton Orphan Asylum. Through the niggardliness of the Government officials, this unique specimen of Roman workmanship, instead of being deposited in the British Museum, has been allowed to pass into private hands.

A paper was also read by Mr. Cussans on a curious mural painting and a window discovered in Buckland Church, Herts. The painting represents the rod of Jesse rising between, or rather separating, a bush and flames of fire. At the top of the rod is a rose enclosing the sacred monogram, I.H.C. (Old English), the whole encompassed by a chain, the top link of which is broken. Some interesting remarks were made respecting the origin of these letters in connection with Christian worship. I.H.C. was undoubtedly the earliest form, and stood for the first three, or possibly for the first, second, and last letters of *Ιησους* in Greek capitals. The *Iota* was I in Roman character, the *Eta*, H, and the *Sigma* was expressed in its ancient Greek form by the Roman C. When these capitals were represented in what printers would call "lower case," they stood I. h. s., to suit which the interpretation *Jesus hominum salvator* was subsequently devised. Mr. Cussans also exhibited some curious terriers, and copies of Court Roll, belonging to the lordship of Amwell, commencing from the year 1308.

At the ensuing meeting Mr. Overall will read a paper on the metal Laton. Although this word occurs so frequently in ancient documents, it is a moot point amongst antiquarians what it really was: whether brass, pewter, or tinned metal of any kind.

An ingenious arrangement for the artificial raising of water, to supply power for a flour-mill in a United States town, may be briefly described as follows:—The process is nothing more or less than to introduce steam—the exhaust of a non-condensing engine is sufficient—into a reservoir connected by a pipe with a supply of water below, and then by a jet of water to condense the steam, creating a vacuum, which is instantly filled with water to be discharged into a flume or reservoir, from which it is carried to the water-wheel.

THEATRES.

NO one who has kept his eyes open can have failed to have seen a manifest improvement of late in many things pertaining to the theatre. It will suffice for the present to enumerate some, as, for example, the sunk float, the equal distribution of light in what is called the auditorium, the construction of scenery, and the introduction of figure painting by artists of known ability. So far things look more promising than they did twenty years ago—emphatically things, not men and women. Of actors and actresses I have nothing whatever to say at present. Parallel with these marked improvements certain features have been developed which go far to counterbalance the advantages already mentioned. These are the subsidence of architectural form, the over development of the balcony system, the extension of the pit, the publicity of so-called private boxes, and, above all, haste in building.

Probably every architect who has had practical experience of the difficulties involved in building a theatre—difficulties which I would not for a moment presume to underrate—will meet us at starting with the assertion that those things I have enumerated as defects are not defects, and that, if time proves to the contrary, he at any rate is not to blame. The subsidence of architecture as a fine art, in connection with theatres, is remarkable. A theatre must either be rectangular or circular in its constructional boundary. The rectangle takes us back to the inn yard of our own country and the cortile of Italy, in which actors performed without scenery, and under the severe test of daylight. The circular form takes us back, by way of Palladio and the Vitruvian plan, to the mighty semicircles of Asia Minor. Projecting within the constructional boundary are certain tiers of galleries, which may be rectangular within the rectangle, as at the Haymarket, or concentric within the circle, as at Drury Lane, or circular within the rectangle, as at Covent Garden. Now, to anyone who has a weakness for looking towards the stage during the progress of the play, and has the pleasure of a side seat in the rectangular house in the Haymarket, it is quite unnecessary to say a word in condemnation of this plan, as there carried out. But the rectangular or square nucleus is by no means to be despised; on the contrary, I believe that, in the hands of an architect unfettered by managerial trammels, it is a form that would prove itself capable of a development which, whilst satisfying the dramatic student, would not outrage the architectural judgment. That we have no such theatre is, I am persuaded, the fault of managers, and the system to which managers seem slavishly chained, and not the fault of architects, except in so far as architects sacrifice their judgment to worn-out conventionalities and narrow prejudices. That much may be made of the square or rectangular idea, I thoroughly believe; but we shall learn nothing from the Theatre Royal, Haymarket, or the Opera House, Covent Garden. If we turn to the circular form of theatre, the poverty of the architecture—if architecture it can be called—is quite as manifest as in those I have already mentioned. There are two or three foreign theatres, which are exempt from this condemnation—*e. g.*, the Victoria Theatre, Berlin, and those at Dresden and Mayence, especially the last mentioned. Of course, the theatrical manager and everybody whose policy it is to agree with him will join Mr. Fergusson in his condemnation of the Mayence Theatre—a condemnation altogether directed against the only architectural feature of the interior, *i.e.*, the order of columns in front of the two upper galleries which connect the roof with the wall behind the two lower galleries or box-tiers, and which are consequently in front of some of the occupants of the upper galleries. But there are certain people whose delight in what they choose to call architecture is in proportion to the absence of architectural forms. Because, in the hands of some men, pillar and capital, and arch and cusp, have been abused, and all the great and lovely elements of architecture burlesqued, then away with pillar and capital and cusp for ever. Because a few sixpenny seats in the gallery of a theatre would fall behind pillars, then away with these old world features, and this visible constructive support, and go in for concealed girders and all the other cheap expedients which we grandly denominate "inventions." These are the sentiments of those who have hitherto written on theatres, and they seem to have been thoroughly endorsed by the theatre-building architects of the present time. We have, however, three buildings which are more or less free from this new architectural vice; these are the Alhambra, the Holborn Amphitheatre, and the new Shoreditch Theatre. In the Alhambra, we possess the greatest amount of architectural character. Its architect may have adhered a trifle too closely to the peculiarities of the place from whence he derived his inspiration, but, admitting this as an error, fully recognizing the crude way in which the stage impinges on the circle of the auditorium, and cognisant of the space covered by pillars, I cannot but think Professor Lewis has produced the best galleried interior of modern times, regarded solely as an architectural effect. To copy this building for a theatre, I need hardly say, would be most unwise, although many things may be learnt from it. Its arrangement by no means solves the problem of how to build a modern theatre.*

E. W. Godwin.

THE CRANES OF SOUTHWARK STREET.

THOSE accustomed to London's "silent highway," the Thames, are familiar with the many-storeyed warehouses upon its sides, the barge-beds at their bases, and the gibbet-like contrivances for raising freights to the numerous floors. As the new embankment proceeds these features will be changed, and the change is practicable only because railway conveyance has thus far superseded navigation. In Thames-street and in many of the adjoining lanes similar arrangements are found, except that wagons are substituted for barges, and the pedestrian has to thread his way in nervous haste beneath impending loads—grates and crates, bales, boxes, sacks, and packages of all denominations are everywhere swinging in mid-air, the carriageways are chronically "blocked," and the footways occupied by porters and carmen engaged in raising and lowering goods. The privilege or easement is known among wharfingers and warehousemen as cranage, and, though very essential to their business, it is obviously attended with great public obstruction in narrow rivers, and is wholly at variance with modern notions of street economy. Nothing could therefore seem more anomalous than the creation of such easements in a new thoroughfare devised for public use, and formed at great public expense, yet this very creation is, we fear, the distinct blot of Southwark-street. This street is one of the earliest and most successful achievements of the Metropolitan Board of Works. As the much-needed continuation of a line from Westminster Bridge-road that ended at Blackfriars, but now debouches on the Borough High-street, a total of about a mile and a half, it has an importance more than commensurate with its own extent of about five furlongs. The new road is of fair width, is well and evenly paved, has a subway, and is lined, so far as the erections have proceeded, with buildings of a novel and grandiose air. The examples differ widely in expression and merit, but the variety is picturesque, and the masses are in some instances well balanced. The effect is indeed original; no other place is reproduced, there are no shops for retail trade, no private residences, but factory and warehouse, warehouse and factory, are interchanged throughout. This condition of things gives rise, no doubt, to special wants, but the condition has been voluntarily brought into existence, and the wants ought to have been foreseen and provided for without prejudice to public convenience. Before further mischief is done, we would ask the authorities to consider how specious such a benefit will appear whenever the public have to buy up the cranes and cranage of Southwark-street.

* To be continued.

WASHING PUBLIC BUILDINGS.

ONE of the objections frequently urged against London as a place for architectural display is, that its atmosphere is so smoky, and frequently so foggy, that it is difficult, in fact almost impossible, to keep a public building bright, as in France or Italy. This is, no doubt, true. England, like every other country, has its advantages and disadvantages. Disadvantages that are inevitable should be met with resignation; and, as we cannot change the climate or diminish or alter the structure of the clouds, the next best thing is to adapt ourselves to circumstances, and turn the advantages we possess to the best account. The public buildings of London are generally in harmony with the atmosphere of London. They look gloomy; and there has recently arisen a disposition in many minds to treat these buildings as some dirty children are treated—wash them. When the Sultan came to England we treated him, the Greeks said, as if he were Messiah, and, amongst other things done in his honour, we washed Temple Bar. But that renowned obstruction to metropolitan traffic has not looked itself since. Begrimed with the dirt of ages, it appeared venerable. Now it carries with it a kind of would-be look of respectability. Temple Bar, with the gloom of antiquity about it, was bad enough; Temple Bar, with its gloom washed off, is a nuisance, and the sooner it is "buried amid the things that were" the better. No doubt its days are now numbered. We called attention to it a fortnight since, and cautioned the authorities as to its insecure condition. We said that the ominous crack which ran through its centre was visibly increasing. Now that a house has fell down only a few feet from it, let us hope that immediate steps will be taken to prevent the fall of Temple Bar itself.

The Mansion House has just suffered a similar indignity as Temple Bar. It has been washed with soda and water; but, instead of wearing an improved appearance, it exhibits a sickly monotonous look. It looks, in fact, neither ancient nor modern, but pale, insiped, and characteristic. St. Paul's Church, Covent Garden, which is cracked up in "Gwilt's Dictionary of Architecture" as the acme of architectural beauty, but which is, in reality, a heavy, dull, lifeless structure, has also, during the last few days, had its west-end front washed, by a new process invented by a M. Hurwitz, of Paris. The process consists of forcing a jet of water warmed by steam against the smoke-hued stone, and so, with the help of a scrubbing-brush, removing the dirt. Possibly this process has its advantages; but, like all other processes when so applied, it does not improve the face of public buildings. From St. Paul's, Covent Garden, it would not be a very great step to St. Paul's Cathedral. We trust, however, that no attempt will be made to rob St. Paul's of the garment, befitting the metropolis, which a century and half have imparted to it, and substitute in its place an appearance of washed-out respectability. One of the characteristics of St. Paul's Cathedral is the varied light and dark tints which wind and rain have written upon it, and to remove them by artificial aid, and thereby give the building a weak, sickly, uniform hue, would be an economical and æsthetical blunder.

A. WATERHOUSE, ARCHT.

STREET TRAMWAYS.

THE advantages of a smooth tramway over a rough road in reducing the power required to draw a given load, or to move such load at the highest velocity, are known to the veriest tyro in mechanical science. Accordingly tramroads of some kind or other, either of wood, stone, or iron, have been in use from very early times wherever the traffic was uniform and constant, and the loads have been great in proportion to the power at hand to move them, as, for example, in our collieries and mines. In Russia, we are told that the practice of laying down wooden tramways in difficult roads is as ancient as civilization itself in that country. Now, in all our great towns, within the present century, there has sprung up an enormous omnibus traffic subject to conditions precisely similar to those which led to the use of iron tramways in collieries and mines. It is quite as constant in one direction, and is fast growing heavier than can be managed by present available horse powers. The vehicles are small and uncomfortable, and a journey by omnibus is so trying to the nervous system that numbers of persons prefer walking to the purgatory of riding in them. In London, at least, we have not practically solved the problem of giving to these vehicles the smooth surface for their wheels to run upon which will enable them to carry the greatest number of passengers with the smallest horse power, and thus permit the owners to give us better vehicles, cheaper fares, and put us to less discomfort when we are unfortunately obliged to enter them. Other cities are ahead of us in this respect. In the city of Milan the wheels of the carriages have been long made to pass over broad stone trams, with a rougher pavement between for foothold of the horses. In New York iron rails for omnibus traffic were laid down in 1852 along the Sixth Avenue and Eighth Avenue, and, although at first strenuously opposed by thousands of the people, so popular has the system now become in that city that no less than 63 miles of tramway are in daily and hourly use, over which, in 1866, 70 millions of passengers were conveyed by 5,500 horses. In all the other great cities of the United States, and of Canada, similar progress is being made. In Paris omnibuses run upon rails all round the outskirts of the city. In Birkenhead, in Liverpool, in Manchester, in Darlington, and other provincial towns, iron tramways have been introduced, and although, from defective construction, they do not give entire satisfaction, yet, on the whole, they are acknowledged to be of so much use and convenience that their removal would on no account be consented to by the persons who at first vehemently opposed them.

In the metropolis great prejudice has been excited, owing to the failure of Mr. Train's street tramways in 1861. Had he laid down a rail which would not have interfered with the ordinary traffic, while it would have equally well accommodated his own omnibus, we should by this time have had a length of rails far exceeding that of New York. Delays, however, though vexatious, are not unmixed evils, and it may prove that, in the present case, we shall get a rail with the latest improvements, and which shall facilitate not only the traffic of wheels specially made for it, but shall give a surface lessening to the load of every other kind of wheel.

Tramways may be divided into three classes: 1st, for common wheels only; 2nd, for wheels with flanges; 3rd, for both common and flanged wheels. In the first class we may place every construction of wood, stone, or iron which gives smoothness and guidance, without requiring a special wheel to run upon it. We have referred to the stone slabs at Milan, and we may say that such contrivances are not unknown in London in our narrow city lanes, on some of the bridges, and near the docks. These were not laid down for the

STREET TRAMWAYS.

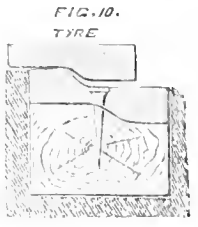

FIG. 10.

purpose of facilitating traffic, but for reducing the wear and tear, which was confined to one precise rut. Yet every driver knows how much the labour of his horse is lightened if he can only manage to get even one wheel upon these smooth surfaces. They give, however, only smoothness, and to lighten the labour as much as possible some amount of guidance is required. This led to the first step towards the introduction of tramplates, as now understood. The first cast-iron plates with an upright ledge (see fig. 1) were introduced by Mr. Curr, at

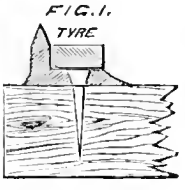

FIG. 1.

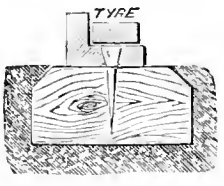

FIG. 2.

the Sheffield colliery, belonging to the Duke of Norfolk, about the year 1776. The ignorant colliers of his day destroyed his railway at first, but he persevered, and his plates afterwards became known by the name of tramplates. Whether this name was derived from Mr. Benj. Outram, the father of General Sir James Outram, of Indian fame, who in the year 1800 effected certain improvements in them (see figs 2 and 3); from the word "tram-

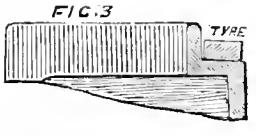

FIG. 3

mel," the wheels being confined to a precise course; or from the "trams" or wagons which run upon them, we must leave the learned and curious in etymology to decide. The improvement usually attributed to Mr. Outram is the substitution of stone supports for timber. It is, however, stated by Wood that this improvement is due to Mr. Barns, who used them at Newcastle colliery, in 1797. A tramway on Outram's principle was laid down from Croydon to Wandsworth in 1801. These, of course, from their upright ledge could accommodate only vehicles of a particular gauge, and would have been quite inapplicable to street traffic, and the first proposal of iron tramways for ordinary street traffic we have met with was a plan of concave rails, patented by Mr. Woodhouse so long ago as the year 1803 (see fig. 4).

FIG. 4.

Another kind of rail presenting a convex surface, and on which, while wheel tires having a corresponding concavity might have an advantage, ordinary wheels could run with advantage and could cross without obstruction, was patented by Mr. Brooman, in 1866 (see fig. 5). We cannot conceive of much objection to the principle of Mr. Woodhouse's rails, over which vehicles of all kinds could have passed without any obstruction, and with great ad-

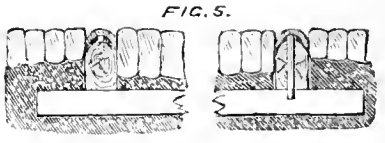

FIG. 5.

vantage, and the only reasons we could suggest for its non-adoption would be on the ground of expense, and that no master mind had arisen to educate the great party of obstructives to improvement in 1803.

The great extension of steam locomotion since 1825 led to great improvements, both in rails and wheels specially adapted for them. However, few, if any, since Woodhouse's patent, suggested anything of the kind for street traffic, till a proposal was made by Mr. W. B. Adams for a grooved rail, with a wheel having a projection in the centre of the periphery to work in it. This proposal was made by him in the "Westminster Review" of September, 1844, and was the first proposal of the kind (see fig. 8).

In 1846, a tramway of timber, with an iron plate at the side for a flanged wheel to run upon, was fixed on Southend pier (see fig. 6), and attracted much notice, as the first public use of a flanged wheel and rail apart from steam locomotion.

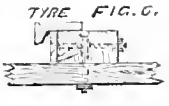

FIG. 6.

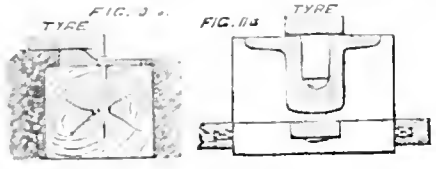
In 1852, the Americans of New York laid down their first line of street rails, of which fig. 7 is a section. In this an endeavour was made to suit all kinds of wheels, a flange working in the groove *a*, and a common wheel being able to run in the wide groove *b*. We can well conceive that this form would be prejudicial to vehicles which might have to cross it, and give rise to the complaints which have been heard both here and there on the danger caused to common vehicles. It seems, however, that so satisfied are the people of New York on the whole, that they would rather incur such small inconvenience, on account of the other great advantages of street railways, and endeavour to improve rather than destroy or forbid them entirely.

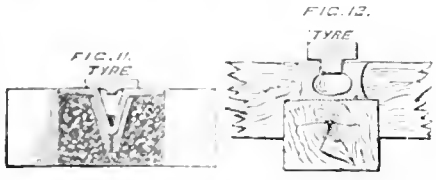
Several forms of improvements patented in New York and England are shown in fig. 8. A simple plan of laying the common double-headed T-rail, so as to suit either flanged or common wheels, was suggested by Mr. W. B. Adams, in a valuable paper on the subject, read at the Society of Arts, in 1857 (see fig. 9).

Mr. Train's street tramway of 1861 is shown in fig. 10, being an improvement upon

that laid down at Birkenhead (see fig. 10a) by him in 1860. Of this Londoners have a lively recollection. Great complaints were made of it, and it was voted a nuisance by a Surrey grand jury, and the proprietors of carriages at the West End. Yet every one who rode in Train's carriages admits fully their great comfort, convenience, and speed. We have said that his failure was owing to his form of rail, and it is with the view of directing attention to the subject that we give these illustrations. A rail presenting in itself no obstructions whatever to ordinary traffic is the grooved or V tramway (see fig. 11). Over this vehicles of all kinds may pass



and repass with the utmost freedom, and no obstruction whatever. They may even pass along it, as shown in fig. 11a, and gain great advantage from it. Thus, by its adoption, an improved route would be secured, not only for vehicles specially made, but everything upon wheels might receive benefits. As our last diagram, we reproduce the original proposal of a grooved rail, made by Mr. W. Bridges Adams, in the "Westminster Review," in 1844 (see fig. 12,); and we hope to



see the day when it or some modification of it shall be general, wherever practicable, through the whole length of our overcrowded streets. A proposal to adopt some such plan has just been rejected by Parliament, but we hear that it is likely to be re-discussed.

In London, without tramroads, we conveyed, in 1866, 44,000,000 passengers by omnibus alone, and required 6,600 horses. In New York, as we stated above, 70,000,000 passengers were conveyed by 5,500 horses. In other words, each horse in London can do only one half of the work that can be done in New York. How long we are to remain behindhand in the path of improvement we do not know. But we trust it will not be long, and that in the country where street railways were first suggested though the suggestion may be carried into practice a little later than by our go-ahead brethren in America, it will be found that the delay has only resulted in the adoption of much more satisfactory plans.

SCULPTURE IN WESTMINSTER HALL.

A CARTOON by Mr. Armstead is now on exhibition in Westminster Hall, showing the way in which it is proposed to decorate that building. The cartoon, which is of large size, forms one of a series of panels into which it is contemplated to divide the walls. The subject is the field of Bosworth. Richmond is in the act of placing on his own helmet the crown which has just been taken from the dead Richard. The design is by no means good, as the lines are very rigid and ill chosen in their rigidity. A bas-relief, to be worth anything, should have easy flowing lines, and we wonder that Mr. Armstead's classical studies should not have taught him as much. Apart from the question of whether this is or is not a good design, it is by no means certain that sculptured decoration would improve the appearance of Westminster Hall. It will assuredly take off from its apparent size, and on that ground alone is undesirable. Already the hall has been hacked about by the insertion of a granite plinth, and encroached upon by the introduction of five or six statues which do not harmonize with it. We believe that these statues were originally intended to be placed elsewhere, but no one seems quite certain where. Very good authorities hold that in Gothic buildings statues should always occupy niches, the opposite treatment of isolating them on pedestals being the Classical method. We may farther remark that white marble statues cannot be satisfactorily introduced in a Gothic building—the contrast is too strong. When our ancestors used alabaster, which is warmer in tone than marble, they generally painted and gilded it. Every portion of a true Gothic building will bear painting and gilding, and as the marble statues in question will certainly not bear that test, they are manifestly unsuitable to the building. Mr. Pitt, in a blue coat, brass buttons, and gilt shoe-buckles, would not provoke admiration, nor would the more gorgeous costume of Fox command respect. We must not, however, be thought to mean that all that is necessary for the proper treatment of Gothic statues is to place them in niches. A visit to Palace-yard will convince anyone of the contrary. It has seldom been our lot to see a worse pair of statues than those of Alfred and William the Conqueror, flanking the clock tower entrance to the arcade. Doomsday Book is growing out of the Conqueror's stomach, and the anatomy of both figures is contemptible. The expression of William is a cross between Motley and Mephistophiles. We are sorry to say that Mr. Armstead is the sculptor, and he bears a high character for correctness. We suppose that press of work has prevented his giving sufficient attention to these two statues, which is the more to be deplored, as they are so close to the eye and in so conspicuous a situation. It would seem as if some fatal blighting influence pervaded Palace-yard.

CUPBOARD EXHIBITED AT PARIS EXHIBITION.

ONE of our lithographic sheets this week illustrates a cupboard, with details, designed by Mr. B. J. Talbert and executed by Mr. Wright. The cupboard was exhibited at the Paris Exhibition last year, and two medals were awarded to the work. It was purchased by the Austrian government for the Vienna Museum. Our illustrations have been reduced by Messrs. McClure and Company's process, from Mr. Talbert's work on Furniture, which we shall notice more fully in an early number of the Building News.

UNIVERSITY CLUB.

THIS building, which forms the subject of one of our illustrations this week, is very nearly finished. The club-house consists of three floors with basement and attics. The principal room is on the ground floor, and is a handsome octagon apartment 22ft. in height, and has a large bay window and sunlight. On the same floor, situated at the back, is the members' dining-room, which is 46ft. by 27 by 17. It is lighted by three windows which occupy the whole side of the room. Adjoining are a smaller coffee-room 27ft. by 18ft.; and a strangers' dining-room 27ft. by 20ft. Both have top lights of ground glass. The smoking-room is on the second floor, with bay window to the front. Its dimensions are 46ft. 6in. by 31ft. by 14ft. 6in. A corridor 72ft. in length leads to the billiard-rooms, of which there are two, each measuring 27½ft. by 22ft. by 14ft. 6in. Like the dining-room underneath, the windows occupy the whole length of the rooms, which are admirably lighted. The drawing-room is on the first floor, and is the same size as the smoking-room, but is 17ft. high. This has a fine bay window, and sunlight. On this floor is the library, corresponding in size with the members' dining-room, and is similarly lighted, but has two additional sun lights. These are the principal apartments. It may be mentioned that all the stairs are supported by iron carriages. The club is well supplied with note rooms and lavatories, while the ventilation arrangements seem in every way complete. The club is built of Portland stone, and, as will be seen, shows a considerable amount of ornamentation in details. The two courses of coats of arms are intended to represent the arms of the various colleges both of Oxford and Cambridge. The architect is Mr. Alfred Waterhouse; Mr. W. Brass, of Old-street, City, is the builder. The coloured glass, and lead lights, as well as the decoration of the walls and ceilings, have been executed by Messrs. Heaton, Butler, and Bayne. Mr. H. G. Mappleson is the clerk of the works. The building, which has been nearly two years in hand, is expected to be ready for occupation in April or May.

PLASTER.

"IT seems very hard upon such a really beautiful building material as Portland cement," says Mr. F. Rogers in "Atchley's Price Book" (the second edition of which is announced), "that its use should be almost entirely abandoned to those who hide bad bricks and slovenly brickwork, and rear sham stone 'fronts' with 'Corinthian porticoes.' Why cannot it be used in some common-sense way? As, for instance, in a brick building, if there is wall panelling, the face of the panel might be plastered, and the wall surface would then show the true principle of construction, the panelling being treated with some impressed ornament, and, if colour be required, tiles or terra cotta embedded in the cement. There would be no practical difficulty in doing this, and the thinnest walls would then be as weatherproof as the thickest, by being covered with this imperishable material,—for so it is, if properly mixed and laid. Some of the older timber-framed houses of Chester and Shrewsbury are covered with lime and hair, and a large embossed scale pattern worked upon the face of the plaster. Some nice effects of colour are produced in old houses in Kent and Sussex by two coats of different coloured plaster, parts of the outer coat being scraped off whilst still wet, and then filled in, thus revealing the pattern by the variation of tint. The prevailing idea as to room ceilings seems to be an elaborate coroice bounding its junction with the wall, and a still more elaborate 'flower' in the centre; and, although this may be a very tasteful arrangement, it does not contain the essence of all that can be done in this feature, and I cannot help wishing sometimes that the ceiling was divided into simple panels; even a simple ribbed moulding would do; a pattern in the centre of the panels, if you can afford it; if not, leave the bed plain. This would give a much greater scale to a room, and would do away with the necessity for so many plaster flowers growing upside down. The eighteenth-century fashion of arranging a room with a low skirting, a dado at the height of the chair-backs, and the space below left for panelling or other decorations, whilst the space above may be papered or otherwise decorated, is one which certainly gives great dignity to a room, adding to the apparent height of wall, and, in fact, giving us something else than the eternal paperhanging. Whilst upon the internal arrangement of rooms, I should like to say that I cannot see the use of the immense height given to them. They are certainly not easier to ventilate, because in a very lofty room the foul air rises to the ceiling, cools, and then descends again, colder, but not purer than before. An apartment of moderate height, the head of the window coming up nearly to the ceiling, and keeping the top sash generally open a little way, is much more easily ventilated. If to this be added a double sash, perfect ventilation and government of temperature may be obtained."

COMPETITIONS.

Kensal New Town.—An anonymous gift of £4,000 was recently made to the Bishop of London's Fund for the purpose of erecting a church in Kensal New Town. The carrying out of the donors intention was undertaken at the request of the Bishop's Fund Committee, by the London Diocesan Church Building Society, who invited a few architects to submit designs. Out of four sets of drawings sent in the committee have selected the designs submitted by Mr. Bassett Keeling, of Gray's Inn, under whose superintendence it will be at once erected. The church will seat 800 adults, and the inclusive cost, site only excepted, will be covered by the amount above stated.

The St. Pancras Infirmary.—A number of architects having been invited to compete for the above, eight designs were submitted. The guardians have selected the designs of Messrs. John Giles and Biven, of 28, Craven-street, and awarded the second premium to Mr. Burdon, and the third to Mr. Robins. The estimated expenditure is about £33,000, and the number of patients to be provided for, 500.

Worcester Orphan Asylum.—The competition for this building, the advertisement of which appeared on August 17, 1867, has resulted in the selection of a design, the joint production of Mr. William Watkins, of Lincoln, and Mr. S. Dutton Walker, of Nottingham. There were twenty-three competitors. As regards external treatment, economy being a great consideration, little stonework has been introduced, but the effect has been obtained by a bold treatment of the roofs, the general grouping of the design, by a broken and picturesque skyline, and by the introduction of Staffordshire blue brick bands or strings. The building is designed to accommodate 25 girls and 25 boys, with arrangements for the extension so as to receive double that number when required. The material chosen is red brick and Bath stone. The estimated cost is £4,000.

BUILDING AND LAND SOCIETIES.

The Bradford Third Equitable Benefit Building Society, which we believe has one of the most extensive businesses in the country, and has proved eminently useful to artizans and others, held its fourteenth annual meeting last week. We learn from the official report that, while in 1866 the receipts of the society amounted to £202,851, they had reached in 1867 to £231,647. The amount advanced on mortgage in 1866 was £94,317; in 1867, £108,206. The number of members had increased from 3,711 to 4,090, and the shares from 10,126 to 11,772. A bonus of 6 per cent. upon invested subscriptions was declared.

The directors of the Leeds Permanent Benefit Building Society, in their nineteenth annual report, state that in all its sources of income great progress has been made during the last year. The total receipts of the year were £203,147 10s. 5d., or £3,906 5s. 10d. per week; and the payments £211,032 5s. 9d. The number of new members was 2,043. The board recommend that 2s. 1d. per share be paid out of the surplus fund to those members entitled to the same, until the next annual meeting.

PARLIAMENTARY NOTES.

On Monday next Mr. Candlish will ask the First Commissioner of Public Works whether there is any objection to the erection of a statue of Oliver Cromwell between the statues of the two Charleses in Westminster Hall.—The Metropolis Subways Bill was read a second time on Monday.

The Artizans and Labourers' Dwellings Bill was also read a second time on Wednesday.

ARCHÆOLOGY.

The Government have purchased the antiquarian and archæological collection of the late Dr. Petrie, and the well-known specimen of Early Irish art called the Tara brooch. These are to be the property of the nation, and are, for the present at least, to be deposited in the Royal Irish Academy.

One of the most important of recent discoveries of the archæological sort has been made in Rome, "This is nothing less valuable," says the "Athenæum," "than eight of the missing fragments of the plan of ancient Rome, which was incised in marble by order of Antoninus Caracalla, and is famous under the name of the Pianta Capitolina, and occupies part of the sides of the staircase in the Capitoline Museum. Two of the eight pieces are of considerable dimensions; one of the other fragments illustrates the Porticus Liviæ in the most satisfactory manner.

WATER SUPPLY AND SANITARY MATTERS.

The Liverpool Corporation are about constructing another reservoir for the storing of water at Rivington, at a cost of £130,000; but the scheme was on Wednesday strongly opposed at the meeting of the town council. Mr. Alderman Picton said that there would be no water for the reservoir, and Mr. Miller advised that they should husband their resources for getting water from Bala Lake. In reply, Mr. Beloe contended that an average rainfall would soon fill the proposed reservoir; and that, as for the Bala Lake scheme, they never would be able to overcome the opposition they would meet with from the city of Chester and other parties locally interested.

Building Intelligence.

CHURCHES AND CHAPELS.

The Franciscan Church of the Holy Trinity, at Killarney, has been consecrated. The style adopted is similar to that of Muckross Abbey, which was a monastery possessed by the Order as early as 1340. The length of the building is 165ft., and the width 35ft. The total cost is estimated at about £8,000. Mr. J. G. M'Carthy, of Dublin, was the architect, and Messrs. Barry and Doyle, the contractors.

A new church is shortly to be commenced at Hunslet, under the auspices of the Leeds Church Extension Society. The design, which is by Mr. George Corson, of Leeds, is in the Fourteenth Century style, and the building will be constructed of pitched faced Weetwood wall stones. The plan comprises a nave, with north and south aisles, chancel, organ chamber, and vestry. The church will seat 700 persons.

A new Wesleyan Chapel is to be erected in Norfolk-road, Brighton, to cost about £2,500.

The Catholic Apostolic Church, Chester, which is situate in Church-street, Upper Northgate, was opened for worship on Sunday last. The nave only has been completed at present, and a temporary chancel formed by screens on either side, enclosing vestries for ministers and choristers. The principal entrance is by a western porch or narthex, and the nave consists of five bays lighted on either side by coupled lancet windows, and a four-light traceried window in the west gable. The bays are marked externally by bold projecting buttresses, and internally by the large trusses to roof, which is of high pitch and single span, the whole of the timber framing being visible, which, together with the rest of the woodwork throughout, is stained and varnished. The chancel stalls and a portion of the nave benches are temporary. The font is of stone, and placed at the south-west angle. The nave is 75ft. long by 33ft. wide and 45ft. high internally. The present accommodation is for 360 persons, exclusive of space for lower and upper choir and sanctuary. The complete building comprises future chancel, &c., with tower and spire at the south-east angles, which will form a prominent feature in the view from the Northgate. The whole will be built of brick, with bands of stone, in the Early Gothic style. The architect is Mr. O. Ayliffe, of Manchester, and the general contractor, Mr. Thos. Hughes, of the Northgate. The whole of the works have been satisfactorily executed in a thoroughly substantial manner.

BUILDINGS.

The second contract for the Bolton New Townhall has been let, and gained by the firm who have built the basement—Messrs. Ellis and Hinchcliffe, of Manchester. The sum is between £44,000 and £45,000. Their contract for the basement was £11,800. The contract will have to come before the council meeting on Wednesday for confirmation, but there is little doubt on such a matter as to the opinion of the Townhall Committee being adopted.

The North-Eastern Railway Company is engaged in replacing the whole of their numerous wooden viaducts with stone and iron. Upwards of £67,000 have been spent in this way during the past five years, and it is estimated that £110,000 more will be required to complete the work. The Hutton, Malton, and Whitby Viaducts have been completed, the Ripon is in progress, and the Norton is being filled up. The Ouseburn Viaduct will be next taken, after which the remaining works of magnitude will be the Esk Valley Viaducts (two), and the Scotswood, Willington, Cassop, and Bradbury Viaducts. The whole of the wooden bridges, however, cannot be finished till six years hence, and it is proposed to expend yearly a sum of about £20,000 until completion. These renewals are done at the cost of revenue.

The foundation stone of the Brighton Turkish Baths was laid on Monday, the 2nd inst. Let us hope that this speculation will turn out more satisfactory to the shareholders than several undertakings recently set on foot in Brighton, more particularly the three large hotel companies.

The new College Green Hotel, Bristol, is to be opened shortly. It is in the Italian style, both inside and out. The central hall is 62ft. long, 32ft. wide, and 40ft. high, and extends the whole depth of the building. All the bed-rooms are fire-proof. The architect is Mr. W. H. Hawtin, of Bristol, and the contractors Messrs. Beavan and Son, of Bedminster, for masonry, and Mr. H. Brooks, of Bristol, for carpentry.

The newly-erected schools in connection with the United Methodist Free Church at Horfield were opened last week. They have been built at the back of the chapel, of rough stone, pointed, and having Bath stone dressings. The cost has been about £350. A large number of timber merchants, builders, and others contributed to the schools by giving materials. Messrs. Taylor, Brothers, have given the joists; Messrs. Barnes and Sons, the rafters; Mr. Williams, of Westbury, thirty loads of stone; Mr. Eddington, of Horfield, door-frames; Mr. York, Horfield, the front doors, with frames; Messrs. Hall and Sons, the glass, which was put in gratuitously by Messrs. Charley and Moon; Mr. Norris, of Kedwick, two fire-grates; Mr. Lambert laid the flooring; Mr. Davey, of Horfield, did a certain amount of hauling; and Mr. Coates, of Cheltenham road, superintended the work without fee.

Mr. Horace Jones, the architect for the City, in a recent report prepared by him, furnishes a detailed account of the state of the works in connection with the New Dead Meat Market in Smithfield. The report gives a very satisfactory statement of the condition of the building. There are, it appears, 220 men at present employed upon the works, and the erection of the different portions of the market are proceeding rapidly. It is believed that the building will be completed and opened before next Christmas.

The present vegetable market at Edinburgh having been acquired by the North British Railway Company, they are bound to provide another market for the city in the same locality. They propose to form it in the space between Kennedy's Hotel and Waverley Bridge. The level of the proposed market is to be 28ft. below the level of Princes-street, and the work required will be pretty extensive. The successful contractor is not yet announced, neither is the amount of the tenders known, but they are believed to range from £12,000 to £20,000.

The new buildings at Trinity College, Cambridge, erected by the munificence of the late master, will be completed and ready for use in October next. The rebuilding of the front part of Caius College will commence next month, and the work is to cost about £31,000.

Leeds.—The new Church Institute, the foundation stone of which was laid in 1866, is nearly finished. The style adopted is the Decorated Gothic of the fourteenth century, and the cost of the building, exclusive of the site, is about £7,000. The building consists of two portions—a main building, with the front to Albion-street, and a second building at the back, with a distinct roof. The materials employed are pressed brick with stone dressings. The front is divided by buttresses into five bays, which are gabled and finished with stone coping and carved finials. Crockets, representing figures in different designs, are placed on the coping on either side of the finials, and boldly projecting grotesque gargoyles, supported by shafts, rest upon the caps of the buttresses. The roof is high pitched, with an ornamental iron ridge, and in the centre rises a *flèche*, surmounted by an iron cross and finial. The top of the finial is 115ft. from the ground. The architects are Messrs. Adams and Kelly, of Leeds; the contractors being Mr. E. Boothman, for the brickwork, Mr. J. Pounder, masonry, and Messrs. Hall and Son, joiners' work.

We understand that at last something is likely to be done towards restoring Herne Bay pier, and throwing it open both for traffic and as a promenade. Mr. Archibald Dawnay, civil engineer, has the matter in hand, and we have no doubt that, if he is properly assisted by the proprietors and the public, the works will be commenced at no distant date.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before five o'clock p.m. on Thursday.

Notice.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty Four Words.

Replies.—R. L. B.—E. A.—E. W. P.—W. S.—T. S.—C. Brothers.—E. W. P.—E. P.—A. D.—I. B.—P. and S. L. and E. G.—I. H. B.—L. C. I.—H. C.—O. W. D.—P. and R.—L. N. T.—G. H. H.—C. L.—R. P. S.—F. and B.—E. W. P.—S. F. and Sons.—A. W.—I. S. G.—O. W. D.—E. H.—E. J. P.

Errata.—A correspondent last week stated that the new Congregational Chapel at Driffield cost £1,000. It should have been £1,500.

Correspondence.

PUGIN v. BARRY.

To the Editor of the Building News.

Sir,—I am a stranger to Mr. E. W. Pugin, but, as an ardent admirer of his father's genius, and with full faith in the claims made by Mr. E. W. Pugin on his father's behalf, I beg heartily to congratulate him on the extraordinary *faux pas* the Messrs. Barry have made in making public and so positively certifying that a certain design was by their father, when there exists undoubtable proof in the same design of its proceeding from the brain and hand of Pugin! Mr. Pugin's adversaries have herein proved themselves his greatest friends, poetical justice, inasmuch as those who should have been his friends have shown themselves his chief enemies. People often talk about a Providence in events—such may find much worse illustrations of what they mean than in this matter of the design for throne, House of Lords. For my part, I had come to the conclusion from the style that it was Pugin's work, no one but he possessing the same freedom of hand with exact correctness of character and feeling. Dr. Barry insists strongly on Mr. E. W. Pugin submitting the whole affair to the decision of the "Institute." It would be utter folly for him to do anything of the kind: dispassionate unbiassed judgment is impossible there. All the chief members are personal friends of the Messrs. Barry, whilst Mr. Pugin is a stranger to them. They are all Protestants, and a certain amount of odium certainly exists towards Mr. Pugin as being a Roman Catholic. The Messrs. Barry are also in the stronger position, having, as one may say, the "possession," proverbially "nine points." But, more than all this, whilst Mr. Pugin is making public the individual case of his father, he is unintentionally exposing a system. For the members of the Institute to admit Pugin's claims, they must stultify themselves. Is it not a notorious fact that many members of this honourable Institute are mere brain-suckers, whose reputations have been made by the talent of their assistants? If Mr. Pugin is well advised, he will never submit his father's fame to the dictum of such a jury as this. It is the public now must judge in the matter, and, though it may be a work of time, yet, in the end, I am confident truth and Pugin's fame will be triumphant.—I am, &c.,

Justitia.

NEW TOWNHALL, MANCHESTER.

Sir,—The published report of Messrs. Donaldson and Street on the designs for the new Townhall shows the public that the sub-committee of our City Council had good cause for not adopting it when presented. It is to be feared that, unless the whole of the competitive designs are publicly exhibited and the opinions thereby produced influence the selection, a mistake will be made, and thus an injustice done to the eminent men who have competed, as well as to the public at large. Briefly analyzing the report, we find that "St. Valentine" occupies the lowest position as a work of art, and the highest as regards the plan. Another design, however, occupies the position of second in merit of plan to that of "St. Valentine," whilst, as a work of art, this same design is placed at the head of the list. Further, the report states that "St. Valentine" in his exterior and interior architecture is inferior to the others, and recommends additional study and modifications. Surely in an important public monument, of which our citizens should have reason to be proud, we ought to expect a design which is not only a good plan, but more particularly a work of art, and a perfect piece of architecture.—I am, &c.,

Mancunium.

ARCHITECTURE AND INDEPENDENT DISSENTERS.

Sir,—I suppose I ought to thank you for the pleasure of a "new sensation," that of suddenly finding myself asserted to be the greatest architectural humbug in Europe. The novelty of that position, as assigned me in your article of the 28th ult., having somewhat worn off, I now beg some space, not for the purpose of disputing the accuracy of such strongly pronounced opinions, but to record my indignant protest against the imputations made by you, as to "pushing" and taking unprofessional rates of remuneration, &c., &c., which are evidently intended to account for the success with which I am credited. So far from their having any foundation, I beg to say that I never apply to any committee or individual for professional work, never enter into competition, and never charge less than the usual 5 per cent. commission. As to subscribing, I believe that architects rarely build churches or chapels without contributing towards their erection or embellishment, and I am not aware that I contribute more than is usual. I should, however, be perfectly justified in doing this, for, as an Independent Dissenter, of twenty-five years' standing, I naturally have an interest in chapel extension, apart from any professional considerations. Before accounting for my alleged success by unprofessional means, it certainly was worthy of consideration whether my buildings may not have been deemed, by Congregationalists themselves, as specially suitable for their requirements. My long association with, and knowledge of that body, renders such a solution not unreasonable. If, however, you did not intend these obnoxious remarks for me individually, I am justified in asking your repudiation of them in all connection with myself, for they are so interwoven with that portion of your article which is distinctly personal, that the reader can only consider them to have been intended for me. In your various articles on chapel architecture a desire is apparently manifested for its improvement. I conclude by remarking that any rules or suggestions for raising the character of chapel architecture, to be beneficial, must be based on a knowledge of the services and various requirements of Independent Dissenters, and this I fail to discover in any of your articles.—I am, &c.,

W. F. Poulton.

Reading, March 9, 1868.

[We wish it distinctly to be understood that our remarks in regard to pushing architects did not apply to Mr. Poulton.—Ed. B.N.]

ORGANS.

Sir,—I wonder what "A. B. C.," or any of your professional readers, would have said if he had read in a leading musical journal, that architectural power has very much declined in the world—that, in fact, there were only three architects, viz., Viollet le Duc, Kuypers, and Mr. Tarver, or some other possibly rising man; and yet the assertion would not have been a whit more absurd than your correspondent's condemnation of all living organ builders. Your readers are not necessarily judges of organs, or I would not trouble you with my remarks upon the utter nonsense of comparing Mr. Lewis, who certainly is not much more than a fair specimen of English organ builders, with the really leading men in the profession, with such an artist and genius, for example, as Mr. Willis, one of the first organ builders, whether we look to tone or mechanism, that Europe has ever produced, if not the very first. Of this, at any rate, I am quite certain that he far surpasses either Schulze or Cavaillé-Coll. I say this without fear of contradiction, as I am borne out by many of the very highest men in the musical profession, as Dr. Wesley, Mr. Costa, and others. "A. B. C." shows that personally he is not much acquainted with his subject, by his observation upon the effect of the metal upon the quality of sound. Spotted metal does not improve the sound of a pipe at all. You could have a row of pipes alternately of spotted and ordinary white metal without the most accurate ear being able to detect any difference. Here, again, I do not speak on my own unsupported authority. The great diapasons, and, in fact, all the metal, I think, of Father Smith's fine organ at St. Paul's Cathedral was not made of spotted metal. So long as the metal is sufficiently thick and tough there is no particular advantage, except sightliness in its containing so much tin, which needlessly increases the expense.—I am, &c.,

J. C. J.

LOW ESTIMATES, AND HOW CARRIED OUT.

Sir,—Many of your readers, I doubt not, feel somewhat surprised at the great discrepancy in tenders for works which appear weekly in your journal, and any information which would tend to explain or throw some light on the way in which they are carried out, ought to and would, I feel assured, be acceptable. Some months since, I, amongst others, tendered for the erection of a fire brigade station at St. John's Wood, for the Metropolitan Board of Works, the highest estimate being £2,000, and the lowest a trifle under £1,650, the latter being accepted. I paid ten shillings for plans and specifications, and went through them most carefully, and priced it out to do (as the specification certainly implied) a first-rate job. After providing that the ground should be excavated to a sufficient depth to ensure a good foundation, the specification went on to say that the concrete should be composed of fresh burnt blue lias ground lime and clean-washed Thames ballast in the proportion of one of the former to six of the latter, to be thrown in while hot, well rammed, &c. The job having only been recently commenced, and my business taking me past it very frequently, I was rather curious to see how these instructions would be complied with, when—I confess not very greatly to my surprise—instead of clean-washed Thames ballast being used, a little dirty pit ballast, with a great deal of unscreened burnt clay (or ballast if you will), was being used in the foundations. The brickwork is now being carried up on this precious substitute for good concrete, and with a clerk of works looking on. Why, Sir, only a few weeks since, the surveyor to an adjoining estate detected some speculating builders doing the same thing, when he ordered and insisted that it be taken out and proper ballast concrete substituted; and yet, in a public building, one that the whole of the metropolitan public have to pay for, it is allowed to remain. I would, in conclusion, ask what inducement can there be for respectable builders to enter into competition jobs with so little chance of success against the "cheap jacks" of the present day? I enclose my card in confidence.—I am, &c.,

Fair Play.

THE RIGHT THING IN THE RIGHT PLACE.

Sir,—Weather-tiled cottages in Sussex and Surrey, half-timbered buildings of Kent, the stone cottages with mullioned windows in Somerset, the village churches generally, and the Elizabethan mansions, were admirable for Elizabethan times. The red brick houses of the last century in country towns, the French cathedrals in France, the Renaissance palaces in Rome. Wren's buildings are admirable as city buildings and palaces, and eminently suited to their place. Inigo Jones's buildings in like manner. The Belgian townhalls to their municipal wants; English townhalls and market-houses until very recent times have been constructed on principles arising out of local wants; the ordinary seventeenth century houses of a Flemish town were excellent for Flemish wants. So we have found that, until very recent times, people have constructed the right thing in the right place.—I am, &c.,

A. B. C.

Intercommunication.

QUESTIONS.

[707.]—BEAD AND FLUSH FRAMING.—Can any of your readers inform me whether, in bead and flush framing the correct practice is to work the bead on the panel or on the frame? Opinions differ most remarkably on this question, and it is one which ought to be satisfactorily cleared up. Gwilt declares in favour of the panel; Nicholson and Brees state the bead should be on the frame. From all I can learn on the subject, the latter method (which is certainly the best) is the one sanctioned by the older authorities, while modern practice and steam machinery has introduced the former mode of construction. I am told that, where steam machinery is employed, the bead is invariably worked on the panel, with the grain; and at the top and

bottom, where it would occur across the grain, a rebate is sawn out and a wrought bead bradded on. It seems to me that this method, if allowed at all, should only be used for inferior work, and the older plan (which, by-the-bye, obviates the danger of unsightliness from shrinkage) should be specified for all good work.—Gilbert R. Redgrave.

[768.]—PERSPECTIVE.—I should be obliged by any of your readers explaining the method of drawing interiors in perspective. I have looked up a work on the subject, but the method employed there seems to me confused and difficult.—Constant Reader.

[This question was asked in the last volume of the Building News, at p. 658, and was answered and books recommended by various correspondents at pp. 729, 747, 765, and 784.]

[769.]—EARLY ENGLISH STYLE.—Perhaps some of your correspondents would oblige me by enumeratiog a few of the principal examples of the Early English style, as seen in the English cathedrals only?—Architect's Pupil.

[The principal examples of the Early English style in the cathedral churches of this country are to be seen at York, in the north and south transept; Ely, the presbytery; Wells, the tower and the whole western front; Carlisle, the choir; Oxford, in the chapter-house; Lincoln, in the nave and arches beyond the transept; at Durham, in the additional transept; at Rochester, the choir and transept; and the whole of Salisbury Cathedral, which is the only unmixed example of Early English which we possess.]

[770.]—SMOKY CHIMNEYS.—Will some kind reader suggest a cure for a smoky chimney? We have tried nearly every remedy known in Glasgow, but none of them has been of any good. The house is one storey high, and there is a large building close by. The south-west wind blows all the smoke down the chimney; when the wind is in any other direction it is all right.—R. F. G., Glasgow.

[771.]—APPRAISER'S LICENCE.—Will you, or any of your readers, say if an architect requires an appraiser's licence, or any other licence, to enable him to measure off a building and determine the value of the extras, &c?—J. H. S., Leeds.

REPLIES.

[734.]—BUILDING MATERIALS IN NEW ZEALAND.—Messrs. Virtue, Ivy-lane, Paternoster-row, publish a Guide to New Zealand, by James Baird, B.A., and the other colonies in Australasia.—W. G.

[757.]—WATER.—If your correspondent "G. F L." will communicate with us, our chemist will be happy to furnish him with the requisite information for determining the nature and amount of foreign matters in water.—Yours truly, the Silicated Carbon Filter Company, Battersea.

WAGES MOVEMENT.

The strike of slaters in Glasgow has terminated, the masters having conceded the demand of the men for payment at the rate of 6d. per hour.

Workmen's Wages in Paris.—From Mr. J. Ward's recently published work on "Workmen and Wages at Home and Abroad," we find that the general earnings of the Paris workmen in the different branches of industry are much below those paid to similar classes in this country, as may be seen from the following figures:—Carpenters, 4f.; joiners, 4f.; masons, 4f. 50c.; paviors, 4f. 50c.; plumbers, 5f. 20c.; wood-turners, 4f. 20c.; wood gilders, 3f.; cabinet makers, 3f. 50c.; lithographers, 3f. 50c.; stone cutters, 5f. 20c.; painters, 4f. 50c. The dead season in these trades varies from three to four months, and in the case of the painters five months, in each year.

STATUES, MEMORIALS, ETC.

The principal inhabitants of Edinburgh have resolved to erect in some public and conspicuous part of the Scottish capital a statue to the late Sir David Brewster, in commemoration of his services in the cause of science.

Two busts, one of Mr. R. Ingham, M.P., and the other of Mr. Thomas Salmon, the town clerk, have been placed in the Townhall at South Shields. The former is by Mr. Ewing, of Glasgow, and the latter by Mr. Rowe, of South Shields.

A marble statue of Charles II. is now placed in Westminster Hall, which completes the number of statues intended to be placed there for the present, viz.:—Charles I., Charles II., James I., William III., George IV., and William IV. The first of a series of cartoons is now placed between the statues, representing the death of Richard III. and the crowning of the Duke of Richmond.

STAINED GLASS.

Another stained glass window has been placed in the western portion of St. Mary's Catholic Church, Warwick, representing Jesus in the house at Nazareth, between his parents, helping St. Joseph at his handicraft. St. Mary, standing behind, appears to be lost in contemplation of her Divine Son. The subject forms one of a series in chronological order, illustrating the mysteries of the infancy of our Saviour. The work was entrusted to Mr. T. Dury, of Warwick.

LEGAL INTELLIGENCE.

Alleged Penal Liability by the Chairman of a Local Board.—Knight *v.* Dashwood.—This was an action (special jury) brought to recover penalties amounting to, in the aggregate, £1,150 from Mr. Dashwood, the chairman of the Local Board of Commissioners at Ryde, inasmuch as it was alleged by plaintiff, a well known participator in local politics, that defendant, being a commissioner or member of the board, held a place of profit at the same time, thereby rendering himself liable to a penalty of £50 for every occasion on which he sat in his official capacity. Mr. Cole, Q.C., who appeared for the plaintiff, said that the defendant had become a partner in the firm of Messrs. T. and J. Dashwood, timber and cement merchants, who supplied goods to the board, and after such disqualification continued to act as chairman of the said board. Several witnesses were called in support of the case, and some merriment was caused by their one and all declining to give evidence until their expenses were paid. Mr. H. Dashwood, of Gosport, timber merchant, said he was sole proprietor in the firm of Dashwood and Co. His brother Thomas was never a partner, and he had never had a partner at all. There was to have been a partnership in 1865, but it never came to anything. James Dashwood was never a partner either. Thomas had money in the firm, but received no profits whatever. It was part of the father's estate, pending a partnership which was never carried out. The money was used in the business of the firm. Never paid any interest on it, nor would he tell Mr. Cole what money remained in the firm of this or of another brother. The judge said, if the witness was believed, he disproved the case; if he was disbelieved, there was no opposing evidence. The defendant's case was not opened, and plaintiff was non-suited.

Important to Timber Merchants.—A case of interest to local timber merchants was decided by the Judge of the Bristol County Court last week. The plaintiffs were Messrs. Barnes and Sons, the well-known timber merchants, of this city; and the defendants, Messrs. Pearson and Leng, owners of a barque called the "Hope." Both parties were represented by counsel. The action was for the recovery of £30, which the plaintiffs had paid as demurrage under protest, and also £15 4s. 7d. for timber alleged to have been deficient in a cargo belonging to the plaintiffs. His Honour, in delivering judgment, read and explained the charter-party, by the terms of which there were 20 "lay days"—which were the days on which the ship should be unloaded; the charter-party contained also an agreement that the sum payable for demurrage should be at the rate of £10 per day. The cargo was not discharged till three days after the "lay days" had expired, and the £30 alleged to have been forfeited were paid under protest, in order that the plaintiffs might not be put to the inconvenience of having a portion of the cargo detained — a course with which they had been threatened. The plaintiffs were not only the consignees of the cargo, but they were also the owners, and as such they were liable for what was called "general average." On the 27th day of December a demand was made upon the plaintiffs on account of "general average." The plaintiffs did not consider themselves bound to sign the bond, and refused, and the delivery of the cargo was stopped for three days in consequence—such three days forming a portion of the 20 "lay days." Then the plaintiffs signed the bond, and the delivery was continued. His Honour, in delivering judgment, recapitulated the facts given in evidence, remarking that the defendants on the arrival of the "Hope" in Bristol, requested the plaintiffs to give them a bond to secure payment of their share of average loss incurred during a collision in the Channel, but the plaintiffs refused to sign a bond, although they expressed their willingness to pay the average, when ascertained. They disputed the right of the shipowner to demand such a bond, and his Honour considered that the shipowner could then have exercised his right of lieu for general average, but, as the consignees had no means of ascertaining the amount claimed, the shipowner, before putting such lien in force, and stopping the delivery of the cargo and incurring demurrage, should have first stated what sum he claimed. There was, however, no such demand of any particular amount, and no refusal to pay. The plaintiffs, indeed, always admitted their liability and their readiness to pay. From the custom as to unloading timber ships, the captain had no control over the work, and the consignee had no power to hasten the delivery. His Honour considered that there was such a default by the shipowner as to disentitle him to reckon as part of the twenty "lay days" the three days occupied by the non-discharge of the cargo, the stoppage being caused by the claim for average. As to the £30, therefore, the plaintiffs would have judgment. The claim for oak would be disallowed, as the master's signature to the bill of lading did not bind the owner, and from the mode of shipping it on board it seemed that a less quantity could not have been delivered, but the plaintiffs would have judgment for the staves lost, as it was clear the delivery had been carelessly made, and the witness actually saw some of them thrown into the water instead of on the raft. Judgment for the plaintiffs for the sum of £31 13s. 5d.

Our Office Table.

At a recent meeting of the British Archæological Association, Mr. Vanderpant exhibited a bronze urn, or rather tomb, said to have been exhumed in the Etruscan Necropolis of Perugia. It was supposed to have contained the ashes of Tanaquilla, wife of Tarquin, fifth king of Rome. Mr. Holt exhibited two fine wood carvings by Hans Springeuklee, an intimate friend of Albert Durer, to whom they had been presented on his fifty-third birthday, 24th of May, 1553; they represented Adam and Eve in Paradise, and a figure resembling Durer's "Great Fortune." Mr. Cuming exhibited the wedding-ring of Martin Luther, bearing his own and his wife's name inside. This is the property of Mr. F. Gauss, banker, of Vienna, in whose family it has been preserved for 250 years.

The "New York Herald" (Feb. 22) is very much elated with the share of honours that has fallen to the United States in connection with the Paris Exhibition. The Secretary of State at Washington, it says, has received a tabular statement "which shows that, with all the drawbacks and obstacles which the United States representatives laboured under, they are number one in grand prizes, and exceeded every nation except France in the general proportion of awards to exhibitors, and in the proportion of gold and silver medals, and "honourable mention." Austria, Prussia, and North Germany, slightly exceed us in their proportion of bronze medals to their number of exhibitors. In the general average, we are just double the rate of Great Britain and her colonies. Taking all things into consideration," exclaims the "Herald" exultantly, "this is considered, perhaps, the most marvellous triumph at a competitive trial of the results of the inventive and industrial energies of the American people, yet we were far from being fully or fairly represented. Taking this as a criterion, however, the national pride may well be flattered by the evidence of our capacity to compete with the world."

At the last fortnightly meeting of the Liverpool Architectural Association, Mr. Kilpin, presiding, Mr. Audsley read the paper of the evening, on "French Church Architecture." The paper, which we understand was the introductory one of a series on the same subject, was very favourably received.

A German engineer states that oxide of chromiam is the best substance for polishing steel. The article can be easily prepared by heating bichromate of potash to redness. It is also used for painting on porcelain. One equivalent of chromic acid is reduced to oxide of chromiam, and, on well washing the residue of the ignition, neutral chromate of potash is washed away, and the ignition is left behind.

An inquest was held the other day on the body of an infant, who was killed by falling down a dilapidated staircase in one of the wretched dwellings of the Borough. The child, who was only a year and a half old, was being carried up the stairs by her "nurse," a girl of fourteen, when the latter slipped and fell headlong to the bottom of the flight, crushing the child under her. The most important and serious piece of evidence was given by the medical man, who stated that the staircase was not only without balusters, but was most awkwardly constructed, and that this was the fourth case in which a person's life had been lost through falling backwards on it.

The vast area of the metal portion of the roof of the New-street Railway Station, at Birmingham, is now being re-covered with Vielle Montagne zinc, by Messrs. Ash and Lacy, of Birmingham. The zinc used is 16-gauge, and more than one hundred thousand square feet will be required to complete the work. The old roof of corrugated galvanized iron has been thoroughly worn out during thirteen years.

M. Charles Méryon, the famous French etcher, died recently at a *maison de santé*, at Charenton. He was principally known by his admirable etchings of Parisian streets and buildings.

The Metropolis Tramway Bill was thrown out on the motion for its second reading in the House of Commons last week. The chief opposition to the scheme, as might naturally be expected, came from the London General Omnibus Company, the monopolists of our street passenger traffic.

We understand that the exquisite cabinet from the Paris Exhibition, manufactured by Messrs. Wright and Mansfield, of Great Portland-street, and which was awarded a gold medal, has been purchased by the authorities of the South Kensington Museum.

Our attention has been directed to an inadvertency in our report of Professor Kerr's lecture, which tends to occasion a little confusion of ideas. When we said that, in defining his view of the word *Architecturesque*, the lecturer stated that it "signified the picturesque in architecture, or architecture worthy of being painted," we should have put the case thus: that the *architecturesque* is that *architecture-essence* which corresponds to the *picturesque* as the *picture-essence*.

The bad light given by oil and candles in the barracks at Perth has greatly distressed the soldiers. Gas being very dear, the authorities have resolved to introduce the lime light. Very satisfactory experiments have been made. The Government contractors state that the price of the light will cost less than half the price of the cheapest gas, and the only objection is, that in the small rooms the light is too good.

The new transparent cement, which has been called "coaguline," the production of Messrs. Kay, Brothers, operative chemists, Stockport, is said to be rapidly growing into use as an article of commerce and scientific application. Its adhesiveness and tenacity are remarkable. Glass, leather, wood, stone, ivory, bone, and minerals can be pieced and joined by it, and so tenacious is it that it will resist a strain of 22 lbs. or more. Heat or cold, fire or water, are successfully resisted by coaguline, and so far as its durability has been tested the cement is perfect. For piecing glass or crystal its uses are admirable, because its transparency renders the junction imperceptible, and its adhesiveness, in fact, makes the broken glass or crystal as good as new. This, at least, is the opinion of the "Manchester Weekly Times."

"Walpole's wailings," as we hear the new railings in Park-lane are called, are nearly finished. It is a satisfaction to notice that they are both neat and substantial, and must be pronounced an improvement. Workmen are now busy finishing the pavement of the newly-widened lane itself.

The "Journal of the Archæological Institute" is sadly in arrear. The "Athenæum" states that the last number published is that for December, 1866! The work will soon be valuable to archæologists solely from an antiquarian point of view.

The Committee of the Art Exhibition at Leeds have given notice that their galleries are quite full, and that therefore further contributions cannot be accepted.

"Argus," in the "Bolton Chronicle," says, when speaking of painters in France, "they introduce talent and produce greater results without the aid of trade unions." Every boy, before he receives his indentures at the termination of his apprenticeship, passes an examination, theoretical and practical. The theory consists in being well versed in the names of colours, shades, and styles of decoration. Designs are placed before him, of which he is expected to give a description. The practical test is ability to mix, blend, and produce any shade of colour the examiners may require; to draw simple ornaments from copies, and straight lines of various breadths and even thickness. The utility of this will be recognised by any practical decorator. A room requires decorating: the artist makes a sketch of the room, on which he writes the names of the colours he requires putting on the various parts. The sketch is given to the workman, who is expected to carry out the instructions to the letter. That done, the workman gives place to the artist, who finishes the whole. The ordinary French working painter, in his knowledge of colours, equals, in many cases excels, the so-called artistical decorators of our country.

The experiments now in progress at Woolwich Arsenal on the manufacture of gas from a mixture of Trinidad bitumen and coal remind us of the recent use of various waste materials for the purpose in Germany. Among these are the residues of the manufacture of paraffin, and the refining of petroleum oils. With each of these materials a large quantity of permanent gas of a highly illuminating power was procured. Another substance experimented with was the waste grease from the woollen manufacture, which yielded a smaller amount of gas. From a review of all the experiments, however, it is concluded that the use of bituminous oils, in combination with coal or peat for the production of gas, offers no advantages, as regards price, over ordinary coal gas. In small works it may be profitable when manufacturers use up their own waste products.

We have recently seen notices of the extended use of alkaline silicates in Germany for the preservation of building materials, both stone and wood. The latter application may be noticed here, with the remark that such a fire as that which recently occurred at Charing-cross Station could not have happened if the woodwork had been protected by the means noticed. The cost is but small, and the immunity it gives from fire is complete. According to the expired, and almost forgotten, patent of De Wylde, the woodwork is first saturated with a very dilute solution of silicate of potash, as nearly neutral as possible, and, when this has dried, one or two coats of a stronger solution are given. When lives are lost by fire almost daily, it seems strange that such means of protecting wooden staircases and flooring should be neglected.

Since the morning of Monday week twenty-one fires have occurred in various parts of the metropolis, all of which have been attended by the Metropolitan Fire Brigade under Captain Shaw. The causes were thus described: sparks from fires, 6; defects in flues, 2; heat from stove, 1; children playing with matches, 2; candles and hot ashes, 3; chemicals boiling over, 2; and causes unknown, 5.

A public meeting of the inhabitants of the ward of Farringdon has been held to promote the removal of the Fish market from Billingsgate to Farringdon market. The idea is not a bad one. Not more than a third of the whole supply reaches Billingsgate by water, and it is not in proximity with any metropolitan line of railway. With a more central position, Farringdon offers the advantage of much more room. If anything should come of the scheme, we trust it will not prove quite so miserable a failure as the present vegetable market.

The second general meeting of the Architectural Institute of Scotland for the present session was held in Edinburgh on Tuesday, Mr. J. D. Peddie presiding. The Secretary, Mr. James Gardner, read a paper, "Notes on Spain," in which he gave a narrative of a trip to the Peninsula, describing the principal cities, their architectural features, and the cathedrals, churches, and other ecclesiastical buildings.

Mr. Holmes, of the British Museum, who was sent out to Abyssinia by the Government for the purpose of collecting antiquities, has, we hear, already secured a chalice said to be of the fifth century, and also several manuscripts.

Since we drew attention to the dangerous condition of Temple Bar, we have actually seen workmen stopping up the cracks in the stonework of the Bar with mortar! This is simply monstrous. There is now a general alarm in the public mind about the critical state of this monument, and people are beginning to be afraid to pass under it. One of several correspondents writes:—"Five weeks since an eminent surveyor pointed out to me an extensive crack in the stonework of the Bar, saying that he thought it was not quite safe, and last week another surveyor made the same observation. Now, the old City barrier may, for all I know to the contrary, stand for 50 years or more; but I pass daily to and from business between the Ludgate station and the Strand, and in future I shall prefer the apparently safer route through the Temple." Of course the Bar is doomed, it must come down sooner or later, and, if this be so, considering the feeling of uneasiness which its insecure state occasions in the public mind, we can only hope that it will be removed without delay.

A crowded meeting of the inhabitants of St. George the Martyr, Southwark, was held on Wednesday night at the Pilgrim Hall, Buckingham-square, New Kent-road, for the purpose of expressing opposition to the erection of a mortuary, furnace, and shaft in a small burial-ground in the Old Kent-road, as being obnoxious to the health of the inhabitants, and destructive to the property in the neighbourhood. Mr. William Knox, the chairman, said the vestrymen of the parish had decided on erecting a large deadhouse, with a furnace to burn infected clothing, on the Lock burial-ground in the Old Kent-road, the space being only forty yards square, and in which were buried at least 35,000 bodies. It was intended to crush down those bodies four feet, or that they should be carted away in the parish dust carts. Would they tamely submit to have their property injured and their lives endangered in such a manner? Were the vestry to be permitted to spend £1,600 of parish money at the dictation of a couple of medical men, when a railway arch would be far more suitable for the purpose, and could be rented at a few pounds a year, fitted up at a trifling outlay, and would not be injurious to any one? Mr. Attenborough proposed the following resolution:—"That, if the vestry of the parish carry out their avowed intention of crushing in the bodies interred in the Lock burial-ground, and build thereon a common dead-house, with disinfecting room, furnace, and shaft, it will, in the opinion of this meeting, be a wicked violation of the sanctity of the grave, a constant cause of infection and disease to persons residing in the locality, a very serious injury to the neighbouring property, and a discreditable waste of the parish funds. Therefore this meeting hereby pledges itself to use every lawful means to prevent the vestry from outraging and violating the public feelings by either carting away or crushing in the bodies interred in the Lock burial-ground, and building the dead-house and disinfecting-house thereon." To this resolution was appended a protest, containing eight sections, as an inducement to the vestry to alter their decision. The chairman put the resolution and protest as one motion, and it was unanimously carried.

MEETINGS FOR THE ENSUING WEEK.

Mon.—Society of Engineers,—On "Engineering in India," paper by Mr. F. C. Davies, 7:30.

Tues.—Institution of Civil Engineers,—Renewed discussion upon Mr. Sanberg's paper on "The Manufacture and Wear of Rails." 8

Wed.—Society of Arts,—On "Railways and their Management," by R. F. Fairlie, Esq.

Fri.—Society of Arts,—Cantor Lectures, "The Bleaching Power of Chlorine Bleaching Powder, its Manufacture, and Application to the Bleaching of Calico, Linen, and Paper Pulp, the Manufacture of Chloroform, &c.," Illustrations.

Sat.—Associated Arts Institute,—On "Genius," paper by Marmaduke A. Langdale, Esq.

Trade News.

TENDERS.

Barking.—For the erection of four houses at Barking, Essex. Mr. J. W. Dennison, architect:—

Stokes	£1350
Brett	1266
Withers (accepted)	1090

Bathford.—For a new house, at Bathford, near Bath. Mr. Hans F. Price, architect, Weston-super-Mare:—

W. H. Newman, Bathford (accepted)	£1748 12

Berkhampstead.—For new vagrant ward to the Berkhampstead Workhouses. Mr. W. Brown, architect:—

Chappel, Tring	£1080
Nitingale and Jeffery, Lambeth	1043
Wilkins, Berkhampstead	998
Honour, Tring	954
Webb, St. Alban's	922
Nash and Mathews, Berkhampstead	857
Harris, Berkhampstead (accepted)	785
Cook, Berkhampstead	772

Bletchingley.—For carcases of house and of stable offices at Castle-hill, Bletchingley, Surrey, for James Norris, Esq. Mr. James Wylson, architect. Quantities furnished by Mr. Dan. Cubitt Nicholls. Amounts exclusive of bricks, rubble, stone, and sand:—

	House.			Stables.		
Thomas Little	£6177	0	0	£1435	0	0

Neale and Son, Leicester	2592	0	0
Hardwick and Son, Birmingham	2591	0	0
Lowe and Sons, Burton-on-Trent	2488	0	0
G. Lilley and Son, Ashby	2360	0	0
Hunter and Bennett, Burton-on-Trent (accepted)	2312	16	10
J. and W. Webb, Birmingham (too late)	3211	0	0

CLEVEDON.—For new market for Clevedon Local Board of Health. Mr. Hans F. Price, architect, Weston-super-Mare:—

R. Newton, Wraxall (accepted)	£1120

CLEVEDON.—For a weighbridge-house for Clevedon Local Board of Health. Mr. Hans F. Price, architect, Weston-super-Mare:—

Bennett, Portishead (accepted)	£289

EAST BARNET.—For addition of new aisle and entire re-seating of St. Mary's Church, East Barnet, Herts. A. Rowland Baker, architect. Quantities by F. W. Hunt:—

Rhodes and Roberts	£1261
Carter and Sons	1225
Dove, Brothers	1078
Brass (withdrawn)	1020

ENFIELD.—For alterations and additions to residence, Brigadier-hill, Enfield, for F. G. Catlin, Esq. Mr. Thomas J. Hill, architect:—

Saunders	£765
Sabey	762
Patman, Brothers	729
Field and Sons	727
Bayes	657

HITCHEN.—For erecting a pair of semi-detached villas, for Miss Hall. Mr J. Shilcock, architect:—

Butterfield	£749
French	735
Jeeves	731
Stapleton	719
Ansell	672
Allen (accepted)	670

LONDON.—For new warehouses and offices, No. 61, Coleman-street, for Mr. Charles Titterton. Mr. G. J. Loe, architect. Quantities supplied by Mr. T. R. Nixon:—

Colls and Co.	£2150
Adamson and Son	2137
Axford and Co.	2100
Hart	2080
Rider and Son	2087
Winder	2077
Gammon and Son	2071
King and Sons	2060
Wells	2030
Hill and Keddell	2025
Conder	2022
Wills	1978
Crabb and Vaughan (accepted)	1848

LONDON.—For alterations and repairs at 35, Old Jewry, for J. Bremner, Esq. J. Edmeston, Esq., architect:—

Hawtrey	£726	17	0
Walls	725	0	0
Piper and Wheeler	694	0	0
Colls and Sons	643	0	0
Jenkins	608	0	0
Browne and Robinson	589	0	0

LONG MARSTON.—For farm buildings at Bret House Farm, Long Marston. Mr. W. Brown, architect:—

Durley and Son	£640	0
Newman	601	0
Fleet and Rickards	532	10
Tompkins	526	0
Honour	518	0
Smith and Fincher (accepted)	457	0

LONGTON.—For the erection of a Catholic Church and Presbytery, Longton, Staffordshire, for the Rev. J. Marsam. Mr E. W. Pugin, architect:—

Collis and Hodgson, Longton	£10174
Hugh Yates, Everton, Liverpool	9990

Alfred Barlow, Stoke-upon-Trent	1600
Edward Hughes, Liverpool	9440
Hall and Son, London	9250
Hodgson, Ramsgate	9190
Heveringham, Wolverhampton	9150
Trow and Son, Wednesbury	8870
Richardson, London	8865
Crutchley, Wolverhampton (Presbytery only)	2400

NEWHAVEN.—For new schools and parochial meeting-room, Newhaven, Sussex, for the Rev. E. P. Southwood:—

Parks	£1047	0	0
Simpson	1045	0	0
Card and Son	1037	0	0
Lee	960	0	0
Kirk	950	0	0
Holloway and Son	930	0	0
Morling	897	17	0

PLYMOUTH.—For building additional wing and stables to Ridgway-house, Ridgway, Plymouth. Andrews and Son, architects and surveyors:—

Marshall	£1289
Berry	1114
Clarke	1046
Condy, Brothers	1030
Jenkins	1006
Call and Pethick	983
Harvey	994
Price	959
Bishop	925
Elliott (accepted)	924

PLYMOUTH.—For new shop-front and stables to No. 3, Mount Pleasant-terrace, Plymouth. O. C. Arthur, Esq., architect:—

Condy	£440
Marshall	427
Call and Pethick	390
Finch	366
Bullerd	365
Marshall	345
Elliott	343
Clarke	341

WILLESDEN.—For detached villa on the Stonebridge-park estate (five to be erected). Mr. Bassett Keeling, architect. No quantities supplied:—

Woodbridge	£1548
Linn	1279
Snowdon (accepted)	1185

WISBEACH.—For St. Augustine's Church, Wisbeach. Mr. William Smith, John-street, Adelphi, architect:—

Cave and Halliday, Greetham	£3090	0	0
Bell and Sons, Cambridge	2883	0	0
Cooke, Wisbeach	2875	0	0
Bennett, Lynn	2761	0	0
Brown, Lynn	2751	10	0
Rust, Norwich	2750	0	0
Law, Lutterworth	2730	15	0

WILMSLOW.—For two villa residences, for Mr. John Beaumont. Messrs. Picton, Chambers, and Bradley, architects. Quantities supplied:—

Bowden and Edwards	£3345
Neill and Sons	3320
Gothard	3300
Thompson	3275
Hughes	3100
Royle and Mellor (accepted)	2980

PROPERTY SALES.

MARCH 2.

AT THE MART.—By Messrs. Bromley, Son, and Kelday. Leasehold shop and premises, No. 6, Hope-terrace, Uxbrige-road, Notting-hill, let on lease at £57 10s. per annum, term 37 years from Midsummer, 1867, at £35 per annum—sold for £200.

MARCH 3.

AT THE MART.—By Messrs. Debenham, Tewson, and Farmer.—Leasehold house and shop, No. 328, Goswell-road, with yard and stable in the rear; also two ground rents of £7 and £4 per annum, arising from two houses adjoining, term expiring at Midsummer, 1877, at £15 18s. 6d. per annum—£180.

Freehold two residences, Nos. 7 and 8, Duncombe-road, Hornsey-rise—£1095.

MARCH 4.

AT THE MART.—By Mr. Searle.—Leasehold three houses, Nos. 1 to 3, Black Raven-court, Seething-lane, City, producing £101 18s. per annum, term 77 years unexpired, at £44 per annum—£120

Leasehold house and shop, No. 26, Seething lane, City, term 7 years unexpired, at £36 per annum—250.

MARCH 5.

AT THE MART.—By Mr. Newbon.—Freehold plot of building land, having a frontage of 292ft. to the Hornsey-road, by a depth of 295ft., together with the four messuages and buildings thereon—4,900.

Leasehold house, No. 103, St. Paul's-road, Upper-street, Islington, annual value £60, term 60 years from 1842, at £8 per annum—600.

Leasehold four houses, two with shops, Nos. 28 to 31, Upper Bemerton-street, Caledonian-road, Islington, producing £124 per annum, term 99 years from 1845, at £6 per annum each—£1240.

Leasehold premises, known as St. Andrew's School, No. 22A, Storey-street, Caledonian-road, let at £45 per annum, term similar to above, at £6 per annum—£425.

Leasehold two houses, Nos. 40 and 41, Rutland road, Victoria Park-road, Victoria-park, term 99 years from 1862, at £8 per annum—530.

By Messrs. Scobell and Jenkinson.—Leasehold shop and premises, No. 54, King William-street, City, term 16 years unexpired, at £267 5s. per annum £310.

By Mr. C. S. Barker.—Leasehold residence, No 26, Williamson-street, Albert-square, Clapham-road, annual value £60, term 99 years from 1864, at £7 10s. per annum—£560.

MARCH 6.

AT THE MART.—By Mr. Robert Reid.—Leasehold house, No. 15, Carlton-terrace, Harrow-road, annual value £42, term 78 years unexpired, at £8 per annum—£440.

Leasehold residence, No. 173, Euston-road, let at £65 per annum, term 40 years unexpired, at £16 16s. per annum—£570.

Moiety of freehold business premises, No. 64, Long-acre, let on lease at £94 per annum—£1,120.

Moiety of freehold business premises, No. 65, Long acre, let on lease at £94 per annum—£1,310.

Moiety of two freehold houses, and shops, Nos. 17 and 18, Fetter-lane, City, let on lease at £30 per annum—£365.

Moiety of freehold workshops, stabling, and premises in King's Head-yard, Duke-street, Lincoln's-inn-fields, let on lease at £65 per annum—£1,300.

Moiety of the White Horse freehold public-house, No. 2, King's Head-yard, adjoining above, let on lease at £50 per annum—£580.

Moiety of a freehold house, No. 1, King's Head-yard, adjoining above, let on lease at £22 per annum—£295.

Moiety of a freehold public-house, The John of Gaunt, 10, Duke-street, Lincoln's-inn-fields, let on lease at £60 per annum—£690.

Moiety of a freehold house, with workshops and premises, No. 14, Duke-street, let on lease at £30 per annum—£400.

Moiety of a freehold house and shop, No. 12, Duke street, let on lease at £30 per annum—£290.

Moiety of a freehold house, No. 10, Duke street, let on lease at £60 per annum—£450.

Moiety of a freehold ground rent of £45 per annum, secured upon Nos. 14 to 16 Devereux-court, Strand—£600.

Moiety of a freehold public-house, known as the Bull, Milford lane, Essex-street, Strand, let on lease at £60 per annum—£940.

Moiety of freehold house, shop, and warehouse, situate in Milford lane, Strand—£800.

Three fourth parts or shares of a freehold ground rent of £110 per annum, secured upon freehold premises in Milford lane—£2,060.

Moiety of a freehold ground rent of £60 per annum, secured upon houses, shops, &c., in High-street, Shoreditch—£930

Moiety of a freehold property, Nos 6 to 8 Bow-church-yard, City, let on lease at £260 per annum—£4,500

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

William John Burgis, Sutton, Surrey, stonemason, March 24, at 11.—John French Field, Wood street, Upper Clapton, builder, March 25, at 2.—Browning Scotting, Wilton-road, Shepherd's Bush, builder, March 23.—James W. Woodnough, Hoxton square, Hoxton, bricklayer, March 16, at 2.

TO SURRENDER IN THE COUNTRY.

Joseph Gwinnett Bayley, West Bromwich, builder, March 20, at 12.—Thomas Brading, Ryde, builder, March 25, at 11.—George Wood, Mold Green, near Huddersfield, stonemason, March 23.—William Browning, Whitstable, Kent, painter.—John Steele, Hanley, Staffordshire, joiner.—Henry Mackenzie, Worcester, builder.—William H. Daniels, Gloucester, builder.—Alfred Hayes, Chatham, boat-builder.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

April 6, J. J. Rawlings, Melbourne, Cambridgeshire, engineer.—April 17, W. Miller, Lewisham, builder.—April 21, G. Gale, Sherborne, builder.—April 21, F. W. Vigus, Exeter, timber dealer.—March 26, J. P. Edwards, Holyhead, builder.—April 2, G. T. Ellis, Liverpool, architect.—March 26, C. Casbolt, Balsham, bricklayer.

DIVIDENDS.

A. Newland, Cobham, builder, March 26.—Ebenezer Jones and Joseph C. Jones, Rathbone-place, Oxford-street, engineers, March 23, at 11.—George E. Mills, Cambridge, builder, April 15, at 11.—William Ezard, Filey, Yorkshire, joiner, March 25.

DECLARATIONS OF DIVIDENDS.

Edward Corney, Littlehampton, Sussex, builder.—Henry J. Ledger, Hulme, Lancashire, builder.

PARTNERSHIPS DISSOLVED.

Naylor and Harper, Rawden, Yorkshire, joiners 'and builders.—Oliver and Johnson, Middlesborough, builders.—Firth and Co., Sheffield, builders; as far as regards W. Whittle.—Morris and Greenwood, Rotherham, plumbers.—J. Bee and C. Kershaw, Oldham, Lancashire, joiners.—R. Penketh and W. Hill, St. Helen's, Lancashire, painters.—T. Palframan and J. Johnson, Dewsbury, Yorkshire, painters.—W. Hooker and S. Bagnall, Croydon, Surrey, plumbers.—J. Kemp and G. Kemp, Dartford, Kent, builders.

BANKRUPTCIES ANNULLED.

William Farrar, Red Lion Wharf, Hoxton, stono merchant, March 2.—Thomas Harvey, Fulham, builder.—John Oldham, jun., Grange, Lancashire, builder.

THE BUILDING NEWS.

LONDON, FRIDAY, MARCH 20, 1868.

DWELLINGS OF THE LABOURING CLASSES.*

AMONG the philanthropic societies which have laboured most earnestly to improve the dwellings of the working classes, both in town and country districts, a foremost place is due to the Society for Improving the Condition of the Labouring Classes. Mr. Roberts was for many years the hon. architect, and is now a vice-president of that society. In his former capacity he designed all their model improved dwellings and renovations of old ones. He has also designed a great variety of improved labourers' cottages and lodging-houses for the society, which have been extensively reproduced in various parts of the country. The model houses erected by the Prince Consort at the Great Exhibition of 1851, and now standing in Kennington Park, were also designed by him, and have proved most capable of adaptation to varying circumstances, and most successful in subsequent attempts at dwellings improvement. His book, therefore, deserves all the consideration which lengthened practical experience can claim; and the great number of plans (many of which have been executed) given in the appendix render it indispensable to everyone who desires practically to understand the subject. It is also exceedingly valuable as an authentic record of the precise aims of the philanthropic societies, and the measure of success they have attained. Their objects are thus stated by Mr. Roberts:—

> Those who practically commenced this movement in 1844 proposed to prove by experiment what had previously been often asserted:—1. That houses having good drainage, efficient ventilation, an ample supply of water, and combining everything essential to the health, comfort, and moral habits of the labouring classes, may be built and let to them at rents not exceeding those generally paid for very inferior and unhealthy dwellings, yielding, at the same time, a fair return on the capital so invested. That old buildings may also on the same principle be improved, and rendered healthy dwellings. 2. That, under the influence of efficient sanitary regulations in regard to his dwelling, the working man and his family may reasonably expect a much larger measure of health and life than statistical returns show that they generally enjoy, and which fall greatly short of the portion shared by the more wealthy classes. 3. That the improvement of the dwellings of the working classes will greatly conduce to raise large masses of this portion of the community from the state of moral and social, as of physical, degradation in which they are sunk.

The second and third of these objects, it is universally admitted, have been fully attained. The average annual death rate of the tenants in the improved dwellings is only 17 per 1,000 as compared with 23 to 24 per 1,000, now the general average in the metropolis and the large towns of England, and the returns of medical officers show that in these houses, some of them situated in the worst localities, there has been a considerable diminution, if not an almost total absence, of epidemic disease. The houses are also stated to have had not only a direct influence for good upon the manners of their occupants, but to have created in their neighbourhood a demand for comforts and conveniences which formerly tenants were content to do without. Nocturnal uproars in adjoining streets are said to have gradually diminished, and finally ceased altogether. "They have in their ameliorating influence," says Mr. Roberts, "thus acted as silent monitors, reproving disorder, and encouraging cleanliness and propriety." This creation of a demand for improved accommodation illustrates the different spirit in which Mr. Roberts deals with the subject to that of Professor Kerr, in his paper read before the Institute last year, wherein he most strongly deprecated the introduction of any "sentimental" feeling in the matter whatever. It will also be remembered that he quoted certain statistics from a former edition of this work, showing that 63½ per cent. of working class families inhabited single rooms, and from this fact he inferred that any larger accommodation was altogether unnecessary. We pointed out this unfair inference at the time, and brought down upon us the wrath of the learned Professor. In this new edition, Mr. Roberts himself takes the opportunity to complain of what he justly calls the "misuse" of these statistics. He says further:—

> Both the premises and the conclusions of Professor Kerr, in his paper "On the Problem of Providing Dwellings for the Poor," read at the Royal Institute of British Architects, appear to the author most erroneous, and he can only attribute to the want of a more intimate acquaintance with the subject his having put aside what he termed "all sentimental considerations," as well as the imagining that he viewed it from the sensible and practical point—namely, from a purely business point of view, as based upon figures and calculations.

The chief philanthropic societies for improving labourers' dwellings were established before the Limited Liability Acts were passed, and their promoters could only gain protection from unlimited responsibility at the hands of the then Government by consenting to a clause in their charters of incorporation limiting their profits to 5 per cent. Although there can be no doubt that this limitation was required, and consented to with the very best intentions, we cannot help considering it as an unfortunate departure from the first of their three objects as stated by Mr. Roberts, and which was so justly held by H.R.H. the late Prince Consort as of primary importance to the adequate extension of the work. We have found the fact not to be very generally known, even to persons presumably conversant with the subject. It is, however, of great importance in estimating their financial results, and accounting for the small extent to which their models have been imitated by wealthy capitalists. As a rule, their tenements have been let at rents rather below what may be called the market value, and the returns to the subscribers have naturally also ruled somewhat below a capitalist's estimate of the market value of money. A year or two back, the Metropolitan Association became alive to this fact, and raised the rents of their family dwellings to something nearer their true value, although they are still so cheap that it is a privilege for a working man to get into one of them. The result has been an increased percentage ranging from 4½ to 6¼ per cent. on dwellings which in 1861 produced only from 2⅝ to 5 per cent. This looks at first sight like a violation of their charter, but it is justified by the return upon the whole operations being kept within the prescribed limits, and never exceeding as yet 3½ per cent. It is this latter fact alone which capitalists have given themselves time to look at, forgetful that the operations of the societies embrace many other objects than the simple erection of dwellings for families; such, for example, as the testing of new methods of construction and arrangement, the carrying out of untried experiments in improvements, the provision of lodging-houses for single people, and of laundries, &c., together with the necessary agency for circulating information for the public benefit. Upon some of these objects it would have been idle to expect any but the very smallest profit, and upon others there has been an absolute loss, as will be seen from the following particulars culled from among the mass of valuable statistics given in Mr. Roberts's book.

The other philanthropic associations subject to like conditions in the metropolis are the Marylebone Association, which has renovated five groups of buildings at a cost of £16,439, and pays its proprietors only 2 per cent.; the Central London Dwellings Improvement Company, which has renovated eight old buildings at a cost of £10,080, and pays 3 per cent.; and the Strand Buildings Company, which has erected one new building in Eagle-court, Strand, at a cost of £5,000, and pays 4½ per cent. These three associations let at very reduced rents indeed. There are, however, two other societies, formed under the Limited Liability Act, subject to no restrictions as to returns, and confining their attention to improved dwellings, viz., The London Labourers' Dwellings Society (Limited), which had expended, at the date of their last report, £29,583 in renovating old houses, and pay continually 5 per cent.; and the Improved Industrial Dwellings Company (Limited), which had likewise expended £63,775 in new buildings, and also pay 5 per cent. continuously. These payments are, of course, somewhat less than the actual nett rentals, being the balance left for division among the shareholders after payment of the

* "The Dwellings of the Labouring Classes, their Arrangement and Construction, with the Essentials of a Healthy Dwelling, with Plans and Elevations of Dwellings adapted to Towns and to Rural Districts," by HENRY ROBERTS, F.S.A., F.R.I.B.A. Fourth edition, revised and enlarged. London, 1867.

management and contingent expenses of the companies. A general view of the whole body of statistics will show that certain departments of the great work of dwellings improvement may be entered into by the private capitalist with the certainty of a safe and sufficient return. If the societies above cited, notwithstanding their being restricted by the very terms of their existence to a small profit, their having tried new experiments for the public benefit, and letting at rents below those charged by other landlords, can yet make a rental exceeding 5 per cent., it is surely possible for the private owner, profiting by the result of their experiments, not hampered with their restrictions, having no expenses of a society, and letting at a fair but not extortionate rental, to provide decent and comfortable homes for his tenants, and yet retain a rental quite sufficient for any reasonable man. We hold the possibility of this to be amply demonstrated by the book before us. We have not space to describe all the efforts of private individuals which this book mentions; there are several, as Miss Burdett-Coutts, Mr. Gibbs, Mr. Peabody, Mr. Hilliard, and others. The result of their investments has never been a loss, and we have a general impression that where the owner has practically looked after the laying out of his money, the result has been much better than in either of the societies.

Among the improvements introduced by Mr. Roberts in the construction of improved dwellings was the formation of fireproof floors upon arches of hollow bricks. The extra cost of these is stated at 12s. per cent. on an entire contract of £7,370. A full description of these floors is given with drawings, and remarks upon hollow bricks for general use. He also recommended in his first edition, published in 1850, the use of concrete formed with clean coarse gravel, sharp sand, and one-tenth portion of Portland cement, and worked up between two planks on a frame, within which the concrete may be poured, as forming a substantial wall for cottages. Under the head, "The Essentials of a Healthy Dwelling," we have, among many other things, a number of most useful hints on the choice of a locality and its improvement by drainage, &c., the supply of pure water, the dryness and warmth of the building, the number and dimensions of the apartments, and on light and ventilation. With respect to the influence of light on physical health, a subject of which but little is known, we find it noticed that it was observed by Sir James Wylie at Petersburg, that in hospital rooms without light only one-fourth of the patients left cured, as compared with those who occupied properly lighted rooms. This reminds us of that old obstacle now happily swept out of our way—the window tax, which was a serious difficulty in the way of our early dwellings reformers. Mr. Roberts, however, overcame the difficulty in Streatham-street, by giving entrance to each suite of apartments from a gallery supported next the quadrangle by a series of arcades, each embracing two storeys in height, the slate floors of the intermediate galleries resting upon iron beams. The tenements were thus rendered separate dwellings, and, having fewer than seven windows each, were exempt from the window tax. This plan alone saved the society between £70 and £80 per annum. They were also exempted from the house duty, which was imposed in place of the window tax, it having been decided, upon an appeal to the judges, that every tenement which has a distinct entrance from the street is entitled to a separate assessment. The heavy pressure of rates and taxes is, however, still loudly complained of, being never less than from 30 to 40 per cent. on the gross rental. We are afraid there is no chance of alteration in this respect, all other kinds of house property being charged in a similar proportion. Among the legislative measures of late years may be mentioned the Public Health and Nuisances Removal Acts passed in 1848 and 1849, amended by many subsequent acts; and an act in 1851 enabling parishes or boroughs, with a population exceeding 10,000, to build new houses, or adapt old ones, for better lodgings for labourers, and to defray the expenses out of the poor rates. A knowledge of the practical working, or non-working, of this enactment should be gained previous to the passing of Mr. Torrens's proposed measure. The act for regulating common lodging houses was passed in 1851, and has had the happiest effect. Its advocates now desire to see its provisions extended to all tenements whatever, let at low weekly rents. The most important legislative encouragement, however, has been the act of 1866, enabling the Public Works Loan Commissioners to make advances for the erection of labourers' dwellings at reduced rates. The Industrial Dwellings Company and the Metropolitan Association have already availed themselves of the privilege, and we trust to see it more and more extensively used every year. There is work enough for every agency, whether legislative, philanthropic, or commercial, to clear away the dens, only let them not get in each other's way, or either of them attempt to do the work of the others. The legislature can give valuable aid by clearing away legal obstacles to the acquirement of property needing improvement, and it may also facilitate the transfer of small holdings.

The philanthropists have hitherto done valuable service in erecting so many useful models for our guidance, and a wide field is still before them. The poor we have always with us, and philanthropic efforts should be used for them, and them alone. No more dwellings for respectable artizans should be erected by semi-charitable funds. Our friend Jack Plane, who belongs to a trade society, and knows something about the rate of wages, and the law of supply and demand, and such like matters, is no client for the philanthropists. He is an independent man, working for a fair day's wage, and willing to pay a fair week's rent. Respect his independence, and let it be known that the buildings erected in future by such societies are for the really poor—those who can pay but 1s. 6d., 2s., or 2s. 6d. a-week. These can only be housed more decently than now by the hand which is willing to lend expecting little or nothing again, and we feel assured that, if it were made to be publicly understood that their future efforts would be confined to such, the operations of the societies would be aided by increased contributions from many who now refrain from giving. The notion of dwellings improvement for artizans being a paying investment is a growing one, and, if left to work freely, will increase, provided land can be found for building upon, and by-and-bye Jack Plane himself and his fellows will wake up to it, and we hope to see the workmen of London and our great towns dwelling, not only in comfortable homes, but homes which they have built by their united exertions, and paid for by their individual efforts and self-denial.

THE SEWAGE QUESTION AND BOROUGH SURVEYORS.

MANY of our pages testify to our interest in the question which has been called—and not without reason—the question of the day, viz., how to dispose of the sewage of the towns of this country; but the rude experience of cholera and epidemic fevers has done more to convince the thoughtless multitude of our town councillors that the subject must be attended to than anything we have or could have said. Nevertheless, we have the satisfaction of knowing that what we have said on this subject has been to the point, and is now acknowledged to have been right in the main. We have seen how angry the controversy has been about the question of small pipes *versus* "elongated cesspools" and "sewers of deposit," and we have discerned elements of truth in each of the disputants, and out of the chaos of passion we have endeavoured to bring something practical and useful to light. What if the old Board of Health did insist too strongly upon their small pipes, did not the engineers go too far in the other way when they said that every sewer ought to be large enough for a man to pass through it? We have come to regard this question in a more practical light now, but we are not yet emancipated entirely from the ignorance of those days, or rather, we were not a few years ago. It is not long since a flourish was made about the successful drainage of a town where it turned up, in course of discussion, no traps or special means of ventilation of the drains and sewers had been thought necessary, and were not attended to; and on this vital question of ventilation of the drains and sewers how little do we know, or rather, how little do we put in practice what we do know about it. To purify the atmosphere of a town, or rather, to prevent its contamination, is the great object of all drainage. However magnificent the works, however well proportioned and constructed, if this one requirement of their proper ventilation be neglected, it is enough to destroy entirely their efficiency. Decomposition of, and the consequent formation of gases from, the refuse animal and vegetable matter of the sewers and drains cannot be prevented, but they can be conducted to places where they will be harmless, viz., to the tops of the chimneys of the houses, and there dissipated in the upper air. This should be done at the head of every house-drain, so that, by affording a free outlet for the sewage air when the drains are flushed with water in heavy showers of rain, it is prevented from bursting through the traps in and about the houses upon such occasions. The best means of effecting this object is to carry up a flue of half a brick square along with, but entirely independent of, the fire-flue when the house is being built, and to connect the upper end of the house-drain with this flue by a pipe laid underground. In the case of houses already built, but which must yet be drained, a pipe carried up the gable end of the house, or, where there is no gable, to a point above the eaves of the roof, answers the purpose of ventilation. The ordinary sort of rain-water piping is sufficient for this purpose, say 4in. diameter. Very beneficial results have attended this plan, where it has been put in practice, in respect of the health of the town.

In the various forms of practice of the science of engineering, and the art of building, many forms of practical knowledge are requisite, and in this matter of town drainage our town surveyors are surely in possession, after the last twenty years' experience, of more practical information on the subject and its requirements than our eminent engineers can be; for their extensive practice in railways, harbours, and other large works has necessarily taken their attention away from the lesser works, in point of magnitude, of town drainage.

Now that attention is being so urgently given to these works, because of the powers given and about to be given to the river authorities of the country to prevent their pollution with town sewage, and railways, and other large works requiring the joint capital of speculators, not being just now able to command the confidence of capitalists, we see our engineers turning their attention to this sewage question, but with such crude ideas upon the subject as we might have expected from men who have thought the whole thing beneath their notice as long as there was other work to be done of a more pleasant character. We think, as we have said, that it is to our sanitary engineers we must look for assistance in the sewage question, and we expect to find in our experienced town surveyors all the qualifications necessary to a settlement of it. We believe the chief features of construction proper to sewers and drains to have been

settled, and generally agreed upon; but, in the matter of the disposal of the sewage on the land, the question is not so well closed, and admits of a great deal more being said in addition to the great deal that has been said during the last few years, and it is with the view to the elucidation of the truth in this matter in the quickest possible manner that we say the town surveyors ought to be called on, or those of them who have anything to bring forward specially bearing on the question of the disposal of the sewage.

The suggestion was recently made in the *Times* that Government shall take some one town and apply the system that to it seems the best, and then that all other towns should take that as a precedent, and, supposing it to be faithfully reproduced, that its adoption shall exonerate the town authorities from legal proceedings in respect of the sewage outfalls. This is a good suggestion, but it does not go far enough. We do not believe the Government is in possession of any information on this subject that is not known to the country generally, and, therefore, has no special method to propose but the best of those that have been brought before the notice of the Commission that has lately sat in several towns, and taken evidence to prove the best system to be adopted.

The process of utilization that has hitherto had the greatest success is that of spreading the sewage over land laid out in form to receive and appropriate it. The sewage loses in its passage over the land many of its deleterious ingredients, and flows into the river in a tolerably pure state. In doing so it promotes the growth of plants immensely. Rye grass is the crop that grows most favourably by these means. Five, or six, or even more crops of it are cut every year. Cowkeepers assemble in its neighbourhood, and give a good price for it; and it is, therefore, profitable where a ready sale in London is found for as much milk as can be produced. Equally favourable results cannot be expected everywhere, and yet everywhere must the sewage be used. The Rivers Pollution Commissioners have recommended this method of surface irrigation, but we take it that that is only because it was the best method that had been brought before them, and could show the greatest amount of actual success. We have every reason to believe that that Commission has done its work so far in the most creditable manner, but still the question arises—is this system of surface irrigation to be everywhere adopted? We think it very important to decide this question at once, and it is to this end that we have suggested that the town surveyors of the country should be called upon for any knowledge they may have of this subject. Our town councillors have the common quality of being slow to perceive the advantages of anything new. Anything that is proposed must be supported by the most self-evident proofs of its advantages, or else it is hard to get it tried. This state of things is well enough in one aspect—that of protecting the interest of the ratepayers, and preventing the adoption of wild schemes of so-called improvement—but it is a sad bar to real improvements.

The improvement in the method of utilizing sewage now under notice is that of "Subsoil irrigation," instead of the method of surface irrigation which we have described. Before the year 1855 we are not aware of its having been tried, but in that year Mr. Wilkins produced some great crops of potatoes and other roots at Reading by subsoil irrigation. In various parts of the country gentlemen have conveyed the outflowing liquid of their cesspools through pipes laid therefrom under the surface and spread around in all directions, fertilizing the earth wonderfully. These pipes have been the common sort of drain-pipes, 3in. in diameter, with open joints to allow the escape of the sewage, which is soaked up by the soil, and the mere water surplus sinks into the ground, as the rainfall does. The rising of the sewage up from the pipes to the roots of the crops is probably due to the force of capillary attraction of the soil, but that the liquid is soaked up by the soil and held for the plants to feed upon there seems to be no doubt. It is this contact with the roots and rootlets of the plants that purifies the sewage.

A peculiar system is in practice at West Worthing which is reported favourably of. Another wholly different system is in practice, or will be soon, at Ealing. This, even, is said by some persons to be all-sufficient for the purpose of purification: it is not a utilizing process at all. Then we have the simple act of filtration through gravel, and the prepared clay process of Dr. Bird. Of the many failures of a chemical treatment of sewage, with the intention of completely purifying it, we need not say anything here. Everything seems to indicate that we must use the sewage of towns in fertilizing the land. Following out the suggestion of the town surveyors bringing forward their plans, we would say, that when a selection has been made, let each one of the plans that seems worthy of a trial be tried practically in a town of moderate size. It is with this view that we say the suggestion of the *Times* does not go far enough. Suppose there were three plans radically different in principle (and we do not think there would be more), each of which possessed features the truth or error of which seemed worthy of being proved, we would suggest that each one be tried on a commensurate scale and for a sufficient length of time by the Government, and upon this result let our future operations be dependent. What if this work should occupy two or three years more—if it ascertain the best plan, the time will have been well spent, and our rivers may well remain two or three years longer as they are with such a result in view. Many schemes would be proposed, no doubt, if we may judge by many of those which were proposed at the time of the institution of the metropolitan sewerage, which need occupy very little of the attention of Government, but this ought not to stand in the way of the adoption of the course we have suggested. The few that are worthy of attention will soon be perceived.

When the result has been arrived at, the authorities of the town in which the plan that proves the most successful shall have been adopted will, as suggested before, repay to the Government the expenses incurred, and thereupon that example should, we submit, become a precedent for all other towns. Looking at the general interest of the country in the settlement of this question, we are quite of opinion that a few thousand pounds of the Imperial revenue would be readily granted by Parliament for this purpose. We hope to see some member of practically enterprizing character take up this subject in the House of Commons during the ensuing session. The Government, we are sure, will not obstruct but assist legislation on this important subject. The suggestion that was made a short time ago—that the rainfall upon the roofs of buildings in all towns ought to be caught in cisterns, and used and sent gradually into the sewers—might well occupy attention at the same time.

The owners of "cottage property" in towns are those who most obstruct the authorities in their movements towards improved sanitary conditions, and for these gentlemen it is necessary to make compulsory laws. Very often, non-resident as they are, they care nothing whatever for the health of their tenants. They, unfortunately, cannot see the injury to their own property that accrues when epidemics sicken and kill their tenants, and render them unable to pay their rent, but force them to leave their houses. Be this as it may, however, experience proves to us unmistakeably that the owners of cottage houses in a town will do nothing until they are compelled to do something.

When these things are fully gone into, it is seen how necessary it is to determine whether the authorities of those towns who have already sewered and drained their towns are to be required to lay down other and larger sewers to take the excessive storm-waters, or whether their present sewers are to be rendered sufficient for the purpose of efficient sewerage, by making use of the old drains and original watercourses to carry off the surface water of the streets into the rivers or other natural channels; and, if it be determined that they ought to do so, then to enact that it be compulsory on the authorities to scavenge the streets daily, to employ a fixed number of scavengers in proportion to the population or to the length of streets—it is immaterial which way it be taken—and generally to legislate in the spirit and in pursuance of the good beginning of the Health of Towns Act and the Towns Improvement Clauses Act. In determining which is the best way to use town sewage on land by practical experiments, the question of how much land in proportion to population is required for the beneficial use of the sewage will resolve itself, and when it has been ascertained, it may well be embodied in the further legislation on this subject which is called for. In setting forth the necessity for further inquiry, it is not at all necessary for us to condemn or seem to cast the least reflection on the work that has been done by the Royal Commission, who have inquired into this subject so industriously during the last few years. What they have done could probably not have been better done, but it does seem extremely desirable at this very moment to ask whether the conclusions they have been able to come to are those upon which we must finally rest, or whether further inquiry should be at once begun and carried on to the exhaustion of the question, before the country is committed to the surface irrigation of land with town sewage as the final measure of sanitary science.

THE "TORSO" AND MODERN MANUFACTURED ART.

So much has been said and written about art, that one feels almost ashamed to inflict more on the wearied patience of the few who are really interested in it; but, though so much breath and paper have been expended during the last few years, it is not a little singular to note how very small indeed the practical result has been. This cannot be from want of capacity in those who, like Pugin and Ruskin, have advocated systems of art action so ably and strenuously: it must rather be from the fact of such systems being, in some way or other unperceived by the authors themselves, either obsolete or impracticable. Certain it is that no system of art action has in these modern days been able to perpetuate itself. The whole of them, without one single exception, have died out with their authors and proposers. Why is this? Greek, Roman, Italian, Elizabethan, Gothic, have neither of them grown into national styles, fitted for every purpose, and nationally and universally acceptable. This is not a little to be regretted, for, had the time and energies thus uselessly spent been employed in furthering some plan of artistic action capable of national growth and progressive improvement, how very different would have been the present position of art and architecture, and artists, and, perhaps, of common workmen.

But there is a still more singular circumstance to be noted respecting modern artistic action, and one which has not received due attention: it is that modern art, everywhere in Europe at least, is a perpetual attempt to reproduce the forms and arrangements of the past and obsolete art, while it is well known that the art of the past itself was the result, not of copying pre-existing forms and arrangements, but of the necessities and aspira-

tions of those who invented them, and brought them to the state in which the modern man found them—not simply to admire and wonder, but to copy and attempt to reproduce. Let us, for a moment, confine our attention to one single example, a fragment of antiquity perhaps the most celebrated and universally accepted of all—the "Torso," and see what the time, and dominant system of art action, does with it, and then how itself was brought into being, for this will conduct to the true, and only true, way of vigorous and living art action and art result.

It may be useful, in the first place, to call attention, for a moment, to the evidence—the modern evidence, at least—on which the fame of the Torso rests. Sir Joshua Reynolds, in his lecture on "Form," says of it, "As a proof of the high value we set on the mere excellence of form, we may produce the greatest part of the works of Michael Angelo, as well as most of the antique statues, especially that of the Torso. But, as a stronger instance that this excellence alone inspires sentiment, what artist ever looked at the Torso without feeling a warmth of enthusiasm as from the highest efforts of poetry?" And this, he continues, proceeds from "the perfection of this science of abstract form." I cite this as not merely the opinion and taste of Reynolds, but as embodying the opinion and taste of the Royal Academy, the chief of our modern art institutions, and as sufficient proof, as far as evidence can go, of the esteem in which this famous fragment of antiquity is held. It is, as we shall see, but a feeble reason for so much celebrity, but the world of artists has no more, and, to the majority, it will be enough. No one need be reminded of the numberless drawings of all kinds that have been made of it—good, bad, and indifferent—of engravings and cuts of every size, and models in clay, by students of all degrees of excellence, all going to prove the worth of the original, and the inexhaustible wealth of it as an object of study and imitation. It would be very difficult indeed to say anything in praise of the Torso of the Vatican which would, in the estimation of painters and sculptors, be thought exaggerated or above its merits. No difference of opinion, I believe, exists about it; the world is agreed on it; it is the *ne plus ultra* of art. It is important to note all this, because this famous fragment of the skill of the artist workman is one among the very few of universally accepted instances of perfection in art, as far as perfection is possible to limited human powers.

Sir Joshua, as we have seen—and the reader must be asked to read what he has said with some care—founds the surpassing merit of the Torso on mere form or drawing, as it is sometimes called, for whichever way you look at it it is all-right and well-nigh faultless; but the fact really is that this element of form, however correct, would not have placed the Torso on the pinnacle of art it now stands on—something more and far more difficult of attainment was necessary to accomplish the feat: it was to breathe life into the marble. Every part of it is alive, and this life it is that gives to this fragment as it is (and it must have done this in a still higher degree when whole and perfect) the power that it has over the beholder. It is the result of superlative observing powers in the artist sculptor the author of it, and equally superlative powers of mind and hand executively. It is an autograph in stone. Works of this kind, so few in number, are generally thought to be the result solely of imagination, and are called poetic, from the supposed fact of their being the product simply of the mind of the artist; his imaginative faculty is thought to have created them, and, in the words of Reynolds, the great Academy authority, "It is the privilege of the artist to distinguish the accidental deficiencies, excrescences, and deformities of things: from the general figure he makes out an abstract idea of their forms, more perfect than any one original." Nothing can be more significant than this, and it is the almost universal idea. "Get rid of, and abuse," he continues, "all singular forms, customs, particularities, and details of every kind," and "learn to design naturally by drawing figures unlike to any one object."

I have simply cited these strange notions from this great authority for the purpose of showing how much there is yet to be said on the true nature of artistic action, and how completely they are refuted by this very fragment of artistic and workmanlike skill—the Torso, for, if any work of art ever yet brought into being owed its strength to details and observation of Nature and imitative copying, it is this "Torso." The strength of it is its natural truth. It is not inventive, but imitative, and a most wonderful example of art memory for minute details and finish. I must not forget to mention that it is copied on the Academy medal as the one chief and central object of antique art.

Very much more might be said about it, but my main object in this communication is, not to point out in detail the merits of the Torso, but to call attention to the strange fact that no one in this great country and metropolis, the head-quarters of artists and academies and art, has ever or can ever see it! Let any one who is now curious about it try. Where is there in London a plaster cast of the Torso, fairly taken from the marble original in the Vatican museum? In the antique school of the Royal Academy, you will say at once. Alas, no! there is a cast there, it is true, but, for all that can be seen of the genuine marble surface and cutting, it might as well be a mere copy by some untaught student; nay better, for the Academy specimen is so grubbed up with paint that all the minute details and finish which make up the life and vigour of the original are completely lost and hidden under it. It is, in effect, a "restored" copy of the Torso, and not the Torso itself. No wonder Reynolds said what he did. If other places be searched for it, the like result will be found, and the like disappointment met. At the Crystal Palace and South Kensington Museum so thick is the paint or white composition laid on every figure, both old and new, that no artistic touch or hand workmanship is or can be visible. The figures, whatever they are, are like painted dolls—all life and vigour and workmanship has been fairly painted out! The Torso cannot be seen in London: a journey to the Vatican is imperatively necessary to see it. And yet it is the central figure of the antique and of Pagan art, and the goal to which the modern man cannot attain; he can only try and see what he can do, and gradually, as a student, near it, and then stop.

What a pity, therefore, it is that, with all the wealth of our academies and departments and art societies, some effort is not made to obtain a copy in plaster of this fragment of a figure, simply oiling the surface for transparency and colour sake. I should merely suggest this as a commencement, to begin with the best, and so in time to educate the public, and, for that matter, the artistic eye to the perception of personal and individual artistic skill and finish. Art has, in these days, almost entirely disappeared; art manufacture has conquered it and taken its place. There is, as it seems to me, but one way of beginning anew—to look on the remains of past art, as it has been left us, rejecting all additions and restorations, as they are called. The antique is now only to be seen, as through a smoked glass, darkly and falsely, and to begin all over again, as I hope to show, is only to be done by seeing clearly first what others have accomplished in past and less artificial times. Everything that now is, and every influence, is against this, but there is always one comfort, that truth is truth, in art as in all else, and must eventually prevail.

I hope to be able to show this, and to point out wherein the present and modern system of art action fails, and necessarily must fail, for it is as nearly as possible the reverse of the old system. The Torso was produced through the study of and following Nature—our modern art by the study of the "restored" Torso. The old artists were veritable workmen, and wrought themselves hand as well as mind; the modern artist is not a workman, but a foreman and superintendent and employer of workmen, so that, as an artist, he is dead. The old art societies, if there were any, must have consisted of working men—of artist workmen (and the phrase is thoroughly descriptive); our modern art societies are composed, as everybody knows, of those who do nothing themselves, and whose artistic faculties, whether much or little, are never called into exercise; while the real workers and artists, however feeble their powers may be, are too low down in the social scale, and too obscure and contemptible, and too much crowded together, to form societies composed of individuals with personal and well-marked human and artistic powers. Thus the old art, and the new and modern art, are as far apart as two things can be—the one consisted of artist and workman in one man, the other of artist and workman as separate individuals, having really nothing in common, and working not with, but against each other!

C. Bruce Allen.

BUILDINGS AND EARTHQUAKES.

We have the report of a paper on certain aseismatic arrangements, designed for the preservation of buildings and other structures in countries subject to earthquakes, read before the Scottish Society of Arts last week by Mr. David Steveuson, C.E., Edinburgh. The subject is new and interesting. Having noticed the observations made, under the auspices of the Royal Society of London, by Mr. Robert Mallet, C.E., on the great Neapolitan earthquake of 1857, Mr. Stevenson stated that his attention had been directed to the matter, not as a speculative question, but by the Government, as a problem of practical engineering. In 1858, a treaty was entered into with the Japanese that their ports were to be opened to British traffic, while, for the safety of our mariners, the coast of Japan was to be efficiently lighted and buoyed. The Japanese applied to the Government of this country to advise them as to what was necessary to light the coast, the difficulty consequent on the frequent earthquakes which occur in Japan (sometimes once a fortnight for months together) being pointed out. Mr. Stevenson explained the device he had proposed to the Board of Trade for rendering buildings aseismatic, and illustrated it by diagrams and models. The new construction is based on the principle of breaking the continuity between the earth, which is affected by the shock, and the superstructure which rests on its surface; and the break is effected by the aseismatic joint, which, in the case of lighthouse apparatus, consists in placing the iron table on which the apparatus rests on balls of metal, working in cups formed in the under-side of the table. These balls rest in similar cups formed on the upper side of a lower table. When the lower table is affected by a shock, it is at liberty to move freely, without affecting the apparatus above, which, by reason of its inertia, remains unaffected. The motion being *qua qua versal*, also renders its action the same from whatever direction the shock may come. The aseismatic action has been successfully tested by experiments, and the Government have ordered the whole of the lights about to be erected on the Japanese coast, and which are being constructed in Edinburgh, to be made on the aseismatic principle. As the adoption of the principle is neither difficult nor costly, while it is very efficacious, there seems every probability that it will ultimately be adopted for all architectural or domestic arrangements in countries subject to earthquakes of a destructive character.

As a striking instance of the increase in the value of property in South London, it is mentioned that in 1855 the Angell Town estate, North Brixton, yielded £300 yearly. The rateable value of the houses built upon it is now £27,620.

THE COMBUSTION OF FUEL.

RECENT scientific discoveries, we are told for our consolation, should do much to lessen the alarm of those who fear the exhaustion of our coal fields. Economists, it would appear, have speculated on the possible discovery of some method of producing heat independent of coal, and the decomposition of water has been regarded as a probable expedient. With our present knowledge and appliances, it appears not be difficult, thinks the *Mining Journal*, to realize this proposition, even in competition with coal, at least in a small way. The agents are obvious—wind power, a magno-electric machine, oxygen and hydrogen gasholders, and the electrolysis of water. The result would be that oxygen and hydrogen would be available for the production of the heat which would be required. For use in the arts the oxy-hydrogen furnace would offer advantages far above any other known, and results could be reached impossible with the lower temperature of the coal fire, while the flame would be free from deleterious substances common to coal. Owing to its gaseous form, and the intensity of its heat, this fuel, our contemporary argues, would be manageable in many ways impracticable with coal. For instance, seams could be hard-soldered with great rapidity with the jet of the compound blow-pipe, and it is thought probable that the joints of steam boilers could be treated for welding in a suitable oxy-hydrogen jet. These hoped-for results, however, have yet to be realized. The history of progress in the combustion of fuel, and its apparatus, is extremely curious and interesting. The four great combustibles known to us are wood, coal, peat, and petroleum. These consist principally of carbon and hydrogen, the only bodies to be found in abundance, which burn easily in the atmosphere, without disengaging very pernicious vapours. The first three materials have been used as fuels from time immemorial; in fact, we have no certain knowledge of the date of their first production. Wood, as being the most accessible, it is reasonable to suppose was first in use, and the discovery of charcoal must have followed by accident, probably not long after. Fossil coal is mentioned by Theophrastus as being used by smiths, and Pliny speaks of an ancient people as burning a kind of peat. The discovery in America of that wonderful agent petroleum belongs to more recent times. Mr. S. M. Kier, of Pittsburgh, is stated to have been the first—in 1849—to refine petroleum, which flowed up naturally; and about ten years afterwards a Mr. Bissell had the credit of first conceiving the idea of boring for oil, and a Mr. Drake that of sinking the first well. The last gentleman found very ancient pits, "from fifteen to twenty feet in depth, and from five to eight feet in diameter, carefully walled round their sides with jointed wooden beams, which the petroleum of the soil had completely preserved from decay." It is only within these few years, however, that this liquid fuel has been made available for a vast variety of useful purposes. Since the time when men first hit upon the idea of rubbing two pieces of wood together to obtain fire—the only mode known even now in some uncivilized countries—what an infinite variety of discoveries and appliances have from time to time been made in connection with the combustion of fuel. In one of his recently published volumes of "Abridgments of Specifications of Inventions in the Patent Office," Mr. Bennet Woodcroft has taken great pains to furnish us with a consecutive history of the processes for the preparation and combustion of fuel. From his laborious researches we are able to trace the successive steps in the development of inventions of this class from the earliest times. It has to be noted, however, that patents for property in the application of novel ideas in the arts only began, as he tells us, to be granted in the seventeenth century, and several important processes invented in this country as well as in others have never been patented. There are, however, published documents which supply the gap in the record, and these Mr. Woodcroft has carefully collected, and the result is a complete history of the greatest value. From an examination of these documents we gather, for instance, that the general method of procuring a warm in-door climate in Pompeii was by burning charcoal in a brazier on the pavement in the middle of the room, and allowing the vapour to exude at the door and window. And E. Péclet, a French writer, informs us that the first fireplaces employed consisted of a space beneath the body it was wished to heat, and into which the combustible was supplied. At a later period, when the necessity was recognized for covering up the fireplace to prevent the loss of heat, it consisted of a close space, furnished with a single opening for the supply of air and of the fuel. It was a long time after that grates for receiving the fuel were invented. Their discovery was probably occasioned by the use of coal, which burns badly without a grate. Andirons, or "firedogs" for the hearths on which wood is burnt, are mentioned in an assessment made in 1290 at Colchester. In these we have the origin of the modern grate. These "cobirons" continued to be used in countries where wood is burnt for heating apartments, and they may still be seen in some of the hotels of Paris. In 1785, Dr. Franklin invented a revolving grate with a circular fire-cage, and so made as to be capable of being turned round after being lighted, in order to bring the fresh coals under the burning coals, and thereby prevent the development of smoke. The oldest certain account of chimneys occurs in the year 1347, though those of Winwall House, in Norfolk, are believed to have been built anterior to this date. It would also appear that the manufacture of artificial fuel is due to Sir Hugh Platt, who, about the year 1594, attempted to introduce into England for use in common fireplaces a mixture of coal and loam, according to "the manner of Jukeland in Germainie." The date of the first application of coke as fuel is not certain, though Dr. Percy mentions in his "Metallurgy" that "in 1769, Jars announced the fact that coke was made in England not only in piles, but also in a closed furnace." Sea-coal, it has been said, was first brought to London in 1357, but we find it was used in the metropolis in 1306. In that year Edward I., by a proclamation, "prohibited the burning of sea-coal in London and the suburbs, to avoid the sulphurous smoke and savour of the firing," and in the same proclamation commanded all persons to make their fires of wood. It would be impossible to trace the multifarious improvements that have since been made in the construction of our domestic fireplaces, or in various apparatus and means for the production of heat, which an advanced knowledge of science has enabled us to employ. In a scientific sense, as Mr. Woodcroft remarks, air is fuel. "A jet of oxygen gas, which, of course, does not burn in common air, is consumed in a jar containing hydrogen, in the same way as a jet of hydrogen burns in the atmosphere or in a jar containing oxygen. And just as with the carbon and hydrogen, air has also to be carried to the space where it is to be used, by either a direct expenditure of heat (or work), as with a chimney, or indirectly, as with a steam jet, a bellows, or a fan-blower. It is only lately that any other combustibles than carbon and hydrogen have been employed on a large scale, and for any important purpose. In the Bessemer process of making steel and malleable iron, heat generated from the combustion of the silicium, and of a small portion of the iron itself, as well as the carbon, is utilized." The history or progress in the combustion of fuel, and its apparatus, it is here shown, does not exhibit an advance in parallel lines with the advance of chemical knowledge, as might be expected. "The true chemical nature of combustion was only explained towards the end of the last century; and both the inventions of the hot blast, and of the plan of increasing the heat of molten metal by injecting air, were apparently made without an initial reference to chemical theory. The late great discoveries, principally in America, of liquid fuel were not made by the aid of geological science, but simply by accident. Even the gas furnace, the most scientific modern plan for burning fuel, seems to have been originated in a desire to utilize the fire gases from the tunnel head of a blast furnace, and it was already partly forestalled in the old reverberatory furnace. It is, in fact, to the gigantic laboratory of general metallurgical operations, and more especially to those operations carried out in the blast furnace itself, that we also owe such improvements as the production of coke, the burning of anthracite coal, the hot blast with its water tuyere, and the blast engine. On the other hand, the more recent developments of the gas furnace are much more the results of scientific investigations, and we may expect that, in future years, practical progress in the rational combustion of fuel and the production of heat will advance simultaneously with physical science." The recent discoveries alluded to at the outset of these remarks may be accepted, among other proofs, that it will be so.

WENLOCK ABBEY.*

NEXT in interest to Tintern Abbey, amongst the ruins of the early religious houses of England, we would place Wenlock Abbey. As Salisbury is among the cathedrals, Wenlock is among the abbeys, a true and unique example of Early English or Lancet Gothic architecture. Here we find the vertical tendency culminating in every part, without depression in its section. It seems as though it had grown up from some vital and inherent principle of development, rather than from the agglomeration of minute parts under the cunning of man's handiwork, and reminds us of the well known imagery of Bishop Heber, used in describing the temple at Jerusalem, in which no sound of hammer or of axe was heard. Immediately upon entering the precincts we came to some rich Norman work, belonging, doubtless, to the original foundation; it is to the right as you enter. This work seems to have been of much earlier character than any which we had noticed at Haughmond Abbey, and, in some parts, appears to represent specimens of what has been denominated the Saxon style. We enter through the centre opening of a Norman triplet, with quaint figures in the spandrels, and enrichments, though rude, both bold and crisp; the walls within this elaborate screen reveal some highly ornate interlaced Norman arcading on the right hand, the quasi prototype of the Early English, or Lancet style, and, if it be such, as some suppose, we shall here find in the same building both the type and the prototype, joined together by easy gradations, as we pass from arch to arch and from pier to pier. On the left hand wall the arcading is plainer: in this portion of the ruins was the chapter-house, which measured 60ft. by 30ft. At the extreme end of the right hand, or western wall, we noticed a very curious square-headed opening, with a grotesque face in the centre of it, and a double-headed saurianesque chimera on each side, of very early character, approximating the Runic or Hiberno-British period. The existence of the stone lintel, with its peculiar so-called Runic ornaments, incorporated with the remains of an abbey having a Norman foundation, seems to us very significant, and serves, we think, to favour the theory propounded in a work, entitled "The Towers and Temples of Ancient Ireland," by Marcus Keane, M.R.I.A., viz., that the Normans merely copied the remains of an earlier architecture of Cyclopean character, with square lintels and sloping jambs, as in the old round towers of Ireland, that bear upon their masonry ornaments very similar to these double-headed figures, which we noticed upon the lintel of the square-headed opening in the Norman chapter-house of Wenlock Abbey. The ornamentation of the walls of the chapter-house is peculiar; up the reveals of the

* From a paper read by Mr. H. H. Vale, F.R.I.B.A., at the Liverpool Architectural Society.

arches are some curious elongated quatrefoils or paterae, and a very rich chevroned string course. Some of the capitals of the shafts of this arcading are still in block uncarved, which bears out the idea that much of the carving of the early ecclesiastical structures was left after the completion of the edifices to be carved by the monks during their hours of leisure. Passing through a breach in the wall of the chapter-house, after crossing a level reach of velvety greensward, we come to the gable end of the prior's house, with bold, well grouped, projecting chimney-shaft, with windows at the sides, the whole forming such a gable as those which the elder Pugin has introduced so frequently, and with so much effect, in his domestic buildings and presbyteries.

Wenlock Abbey was dedicate l to Saint Milburga in 680; some portions of the chapter-house arcading would seem almost to belong to that period; the abbey would appear to have been re-erected by Roger de Montgomery, Earl of Shrewsbury, in the year 1080, for the monks of the Cluniac fraternity. The dimensions of the minster were 301ft. long, the transept 166ft. long, the nave, erected in 1127, measured 156ft., the choir, the work of Earl Roger, in the eleventh century, measured 156ft., and the lady chapel, of fifteenth century work, was 48ft. long. A large portion of the north transept remains nearly intact, with the exception of the roof. The remainder of the abbey can now only be read in fragments, but such noble fragments as will well repay perusal. It is said that the Abbey of Paisley, that best bit of true twelfth century work in Scotland, was colonized from Wenlock, about the year 1161.

The area of the abbey buildings was thirty acres. The principal entrance to the abbey was by a gate on the north side of the precincts, which appears to have been flanked by two square towers, one of which remains. The church of Holy Trinity, outside this gateway, was a vicarage belonging to the abbey, together with the rectory of Little Wenlock. The great cloister court, encompassed by the refectory, dormitory, and chapter-house, the sites of which we traversed on entering the ruin, is to the south of the nave. Crossing over the area of the nave from the site of the cloisters, we came to the bases of the great shafted piers which supported the central tower; these huge pillars we found on measurement to be each fifteen feet in diameter—the size, in fact, of many a modern church tower. They are superb, and in part reveal to us the grandeur of this abbey in its golden prime. Standing on the site of the great central tower, with these enormous clustered pier bases, one at each corner, we see around us such marvellous fragments of early Gothic architecture as but very few ruins besides can boast. The gigantic clustered nave piers in rows; the shadowy groined aisles; the double lancet triforia; the attached triplet wall shafting, running up to a stupendous height, and corbelled delicately as to a needle point below the great gables, filled with exquisite lancets, rising tier above tier in well-balanced grouping; the bold, yet simple, moulding of the arches; the spirited and broadly carved capitals, with foliage in high relief; and the beautiful bosses to the triforium labels—one and all combine to make up an unrivalled picture of mediæval power and loveliness. The details consist principally of hollows and beads. The nave piers, each about four feet in diameter, are clustered to the lancet-shape upon their plans, but without fillets, and brought almost to a feather edge; in fact, it will be seen that the general idea conveyed to the mind, by all the forms around us here, is one of intense Gothicity undiluted. Sharp gables, sharp arches, needle pointed corbels, lancet shaped piers, thorn pointed foliage, vertical lines uncut by horizontal members, all give rise to a sentiment of sublimity and of aspiration above the grovelling earth—ideas which are developed by the study of all true Gothic buildings old as well as new; but it certainly appeared to us that the ruins of Wenlock Abbey were preeminently calculated to produce such impressions upon the mind. The lower parts of the interior walling were built of coursed rubble, plastered as a ground for painting. The bold independent spirit of the Gothic mind is shown in a peculiar piece of constructive masonry, at the junction of the piers of the south transept gable with the piers of the eastern aisle of this transept: it is worthy of the study of every architectural student, as it is an evidence that a difficulty well mastered becomes a beauty well won. Several of the exterior shafts of the clerestory lights have gone. It is the vastness of this abbey ruin which strikes one most forcibly, vastness not only in the sense of area but of section and of cube, a profound excavation indeed in some old quarry must have been made to supply the stone for the building of this abbey, and many a hundred details must have been supplied to the handicraftsman by the designer or designers before this stupendous pile rose to its completion. Now the broad lights and deep hollows of gloom, and long perspective rows of shafts and arcades, work upon the imagination as a spell, and impress an unfading charm upon the memory.

BUILDERS' CHARGES FOR TENDERS.

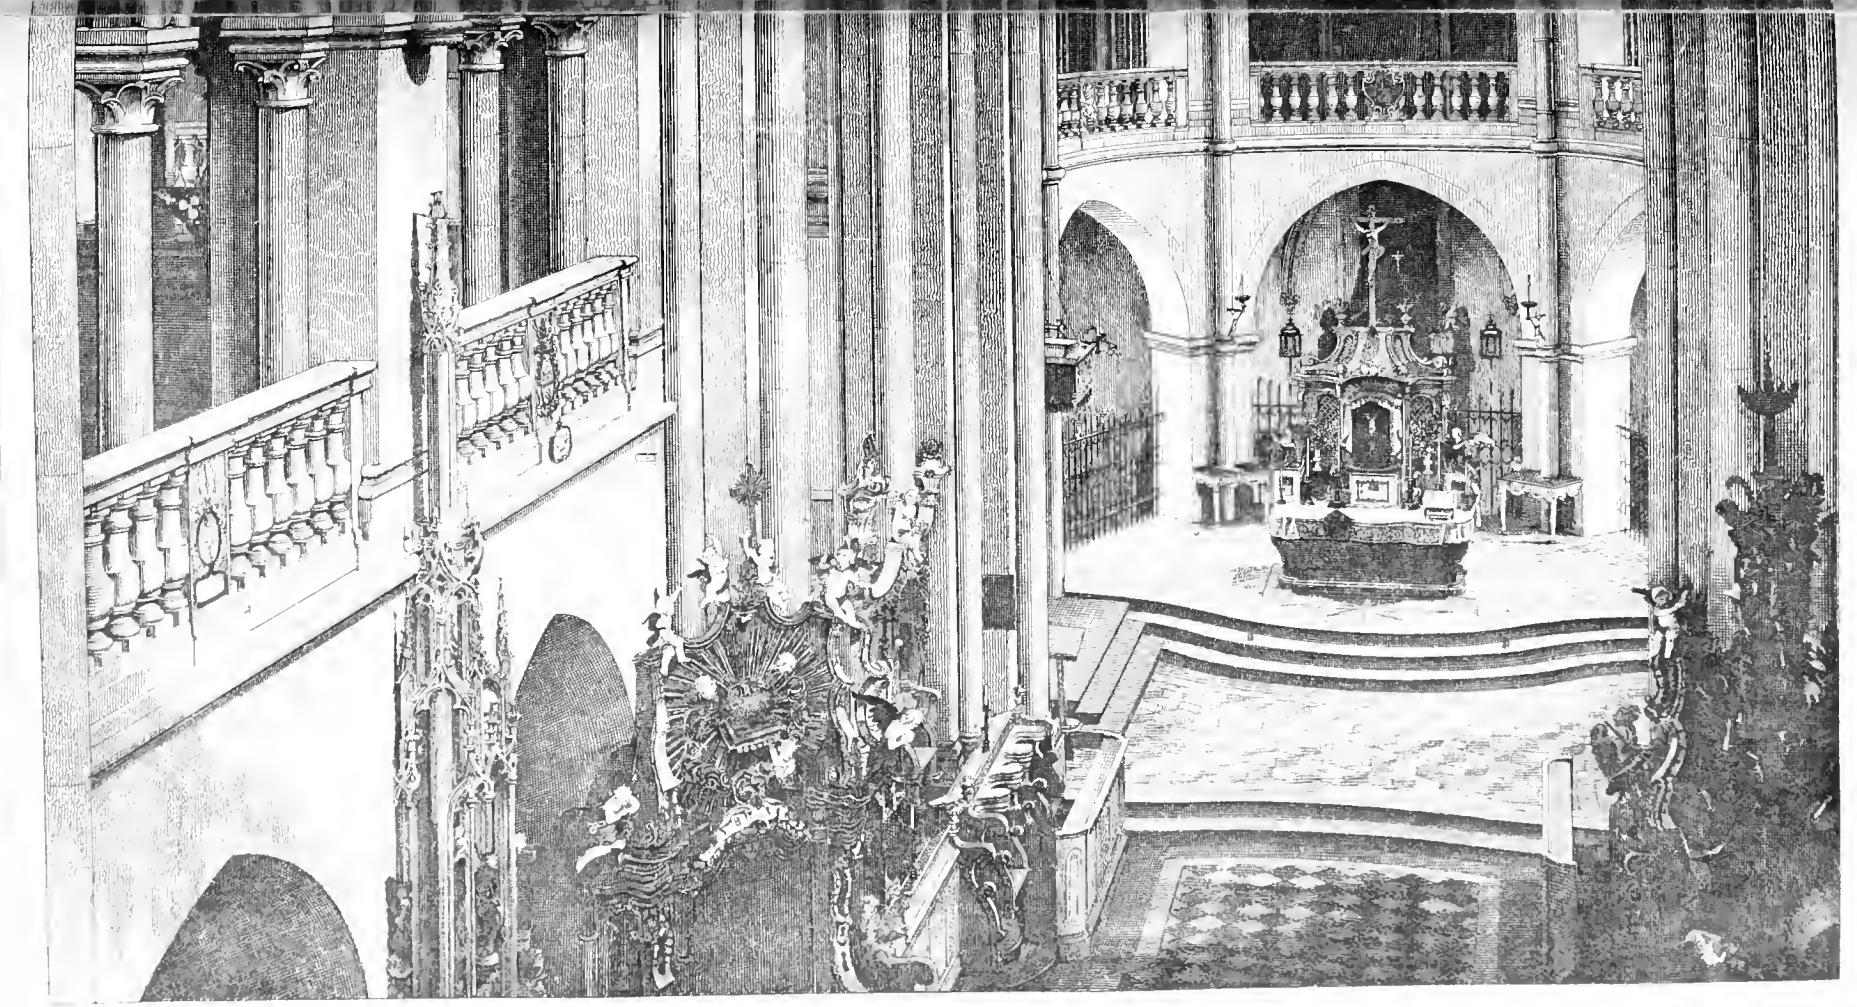
A CASE of considerable interest was tried in the County Court, at Gloucester, last week—Jones and Son *v.* Rees. The plaintiffs are a firm of builders at Gloucester, in a large way of business. The defendant is a leading promoter of a Welsh undertaking for the erection of English Congregational churches in South Wales. In June, 1866, a committee, of which Rees was chief acting member, having appointed Mr. Paull, of Manchester, to be architect for the new church to be erected at Swansea, directed him to obtain tenders in limited competition from five firms, including the plaintiffs'. Quantities were supplied by the architect. No condition was made as to the lowest or either tender not being accepted. The tender of plaintiffs was the lowest, but, being somewhat in excess of the architect's estimate, he was authorized to communicate with them with a view to reducing the work. One of the firm consequently went to Manchester, and all particulars were arranged and duly reported upon by the architect to the committee, who, after some delay, wished to enter into a contract with plaintiffs for the carcase only of the building. The amount of this having been settled upon and agreed to by plaintiffs, the committee found they had been too sanguine as to obtaining funds, and they desired to proceed with the foundations by daywork, under the superintendence of a clerk of works approved by the architect. Plaintiffs demurred to such a course, but on the desire of the architect consented to withhold claim for compensation, and accept a fair amount for their time and expenses in the journey to Manchester. The foundations of the church having been completed up to the ground line, the works were suspended till the spring of last year, when the committee found themselves able to enter into a contract for the superstructure. The architect was then commissioned to re-open negociations with plaintiffs and ascertain if they would take the work at the rates upon which their original tender was based. They consented to do so with a few modifications which the architect arranged, and terms of contract were prepared. Plaintiffs were called upon to provide responsible sureties, which they did, and an appointment was made with the architect to meet and settle all details for a contract. This appointment was set aside by a telegram from the committee, followed by a letter stating that "for many reasons" they had decided not to enter into a contract with plaintiffs, and directing the architect to arrange for the work to be carried out by Messrs. Thomas and Co., of Swansea, whose original tender was next in amount above that of the plaintiffs. Whereupon plaintiffs sent in a claim of £35 11s. 9d, consisting of the following items:—5s. per cent. on the amount of the original tender, £11 4s. 9d.; expenses to Swansea for local information for preparing tender, £5 5s.; journey to Manchester, £10 10s.; second journey to Swansea in 1867, for further local information, £5 5s. The committee rejected the claim, hence the action by plaintiffs. Mr. Paull gave evidence as to the above, and Mr. Neville of Abergavenny, and Mr. Jacques and Mr. James of Gloucester, gave evidence as to the fairness of plaintiffs' charges, and cases where demands under similar circumstances had been paid to builders for estimates. On behalf of defendant, Mr. Watkins and Mr. Rees, of Swansea, two fellow competitors of plaintiffs in the limited competition, were called to prove that under no circumstances were builders' tenders ever paid for; but Mr. Watkins admitted he should consider he had a claim for compensation in a similar case to this, and would have sued in one or two instances in his own experience, if he had known he could recover. Defendant admitted the item of £10 10s. in plaintiffs' bill, and plaintiffs withdrew the last item of £5 5s. The judge decided for the plaintiffs in the other three items with costs.

STREET WATERING.

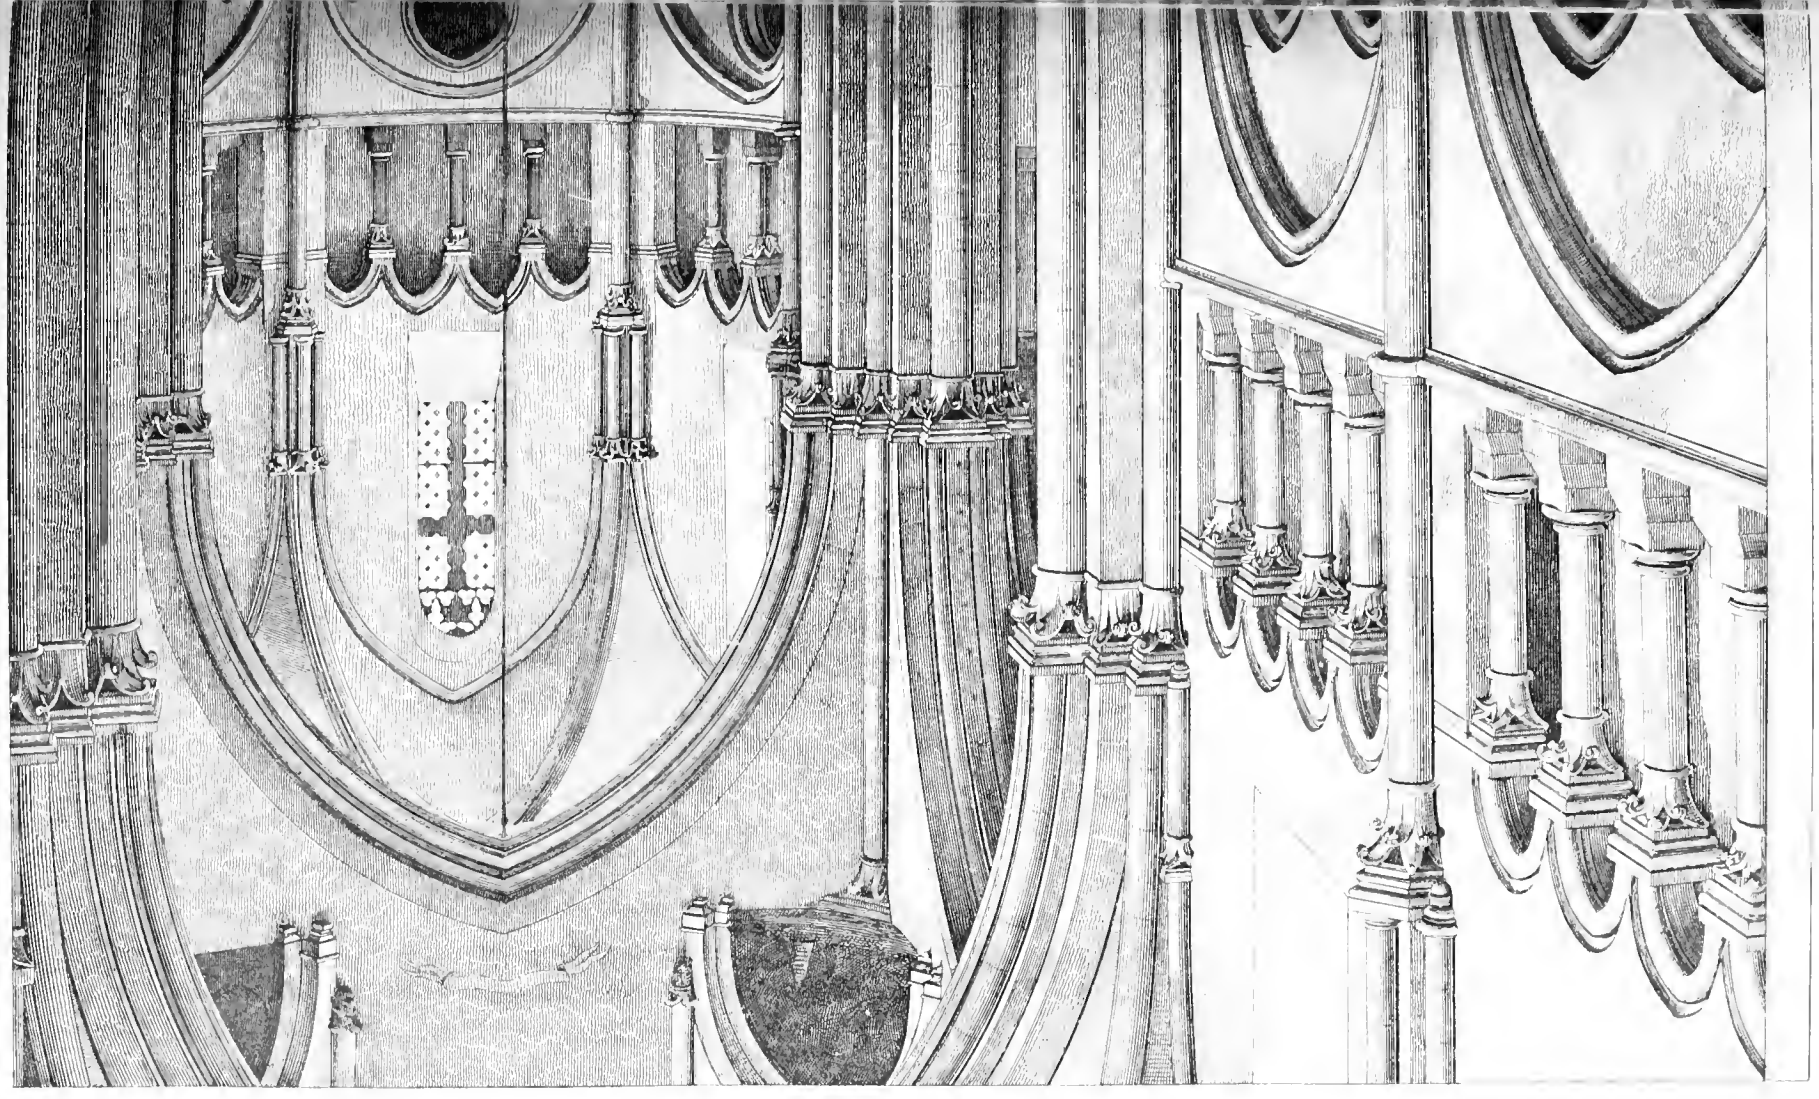
MUD in winter and dust in summer, says Dr. Whitmore, medical officer of Marylebone, in his last monthly report, are prominent amongst the many discomforts to which the inhabitants of London are periodically subjected, and it is very difficult to say which is the greater evil of the two. By means of the latter, when blown about by equinoctial winds, the population out of doors become half-choked and wholly smothered; it spoils to a great extent goods which are exposed for sale by retail tradesmen, and, being composed for the most part of organic matter in combination with pulverized granite, it constitutes a nuisance not only intolerable as regards personal convenience, but in many respects also injurious to health. As a remedy for this evil, the system of street watering hitherto adopted has been found to be altogether ineffective. The object to be attained is simply to lay the dust, but, as in the hot dry days of summer a light sprinkling of water would evaporate entirely in a few minutes, it becomes necessary to use water in considerable quantities, the result of which is that the streets and roadways are at once rendered miry, and, for some time at least after each watering, almost, if not altogether, impassable for ladies and other lightly shod pedestrians.

With an obvious consciousness of these facts, and with a laudable consideration for public comfort and convenience, the vestry, Dr. Whitmore goes on to say, has recently entered into a contract with Mr. J. W. Cooper, the patentee of the improved system of street watering, to water the streets and roadways of this parish with his composition during the coming season, and, judging from such experience as I have been able to acquire respecting it, and assuming that he is supplied with all necessary means and appliances, I should say that it promises to be a success, not merely as it affects public convenience, but the pockets of the ratepayers also, since the amount to be paid to Mr. Cooper is less by upward of £1000 than what has hitherto been paid to other contractors for street watering in the ordinary way. Mr. Cooper further claims for his patent that it will effect a considerable saving of the cost at present incurred in the repair of our macadamized roads, that it will prevent the roads becoming slippery in frosty weather, and that the chemical salts used in his composition, being antiseptic in their properties, are valuable in a sanitary point of view, inasmuch as in hot weather, and especially during the prevalence of cholera or any other epidemic disease, they will act as deodorants and disinfectants. The composition used by Mr. Cooper consists of a solution of the chlorides of calcium and sodium. A well known-property of these chlorides is that they are highly deliquescent, absorbing moisture rapidly when exposed to the air. With regard to the former salt—*i.e.*, chloride of calcium—by some authorities it is stated that, when exposed for a certain time in a moist air, it will take up more than its own weight of water. The retention of moisture therefore by these salts serves to keep the roads in a damp condition for a much longer period than when plain water is applied to them; for, whereas by the usual system of watering, or, more correctly speaking, deluging, three applications per day will hardly suffice in very sultry weather to prevent the dust from blowing, one application of Mr. Cooper's composition at intervals of two or three days will, it is said, accomplish the object. Another point favourable to Mr. Cooper's process is, that the materials used by him are perfectly harmless and innocuous; were it otherwise—were the feet of horses or other animals to become in any degree affected injuriously by it, or were it destructive to shoe-leather or anything else that would ordinarily come in contact with it—such objections would necessarily be fatal to its continued use.

The Science and Art Department of the Committee of Council of Education, at South Kensington, has issued a memorandum intended to explain several points referred to in the committee's minute of the 21st December last. We have already given the principal points of that minute, and it will be sufficient to state that the paper now issued explains minutely the conditions under which the department is prepared to assist the artizan classes who may show an aptitude for scientific instruction, by aiding local efforts in founding local scholarships and local exhibitions.



Limburg · Cathedral . Interior · looking · West.



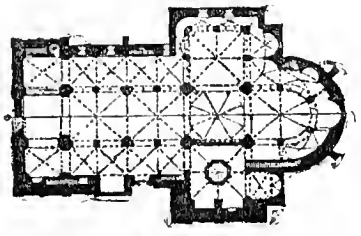
LIMBURG CATHEDRAL.

THOSE who were fortunate enough to see the exquisite drawings which were exhibited as illustrations to the paper read by Mr. H. W. Brewer at the Institute of Architects on Monday last, will have a lively recollection of the two charming views of Bamberg by that artist. Between Bamberg and Limburg, on the Lahn, there is a considerable resemblance; both cities are more like dreams of the picturesque than sober realities; at any rate so they would appear to the untravelled denizen of a monotonous and uninteresting English town, or to one whose highest aspirations are after the vapid modern Parisian type of architecture. Limburg, however, has suffered so grievously at the hands of the improvers of the present century, that to conceive it, in its full mediæval glory, needs now considerable imagination, and a reference to more happily left alone places, like Bamberg. The Cathedral crowns the highest point of the town, as of old, and has been fortunately less injured than most of its compeers. It is more compact and, therefore, perhaps more happily grouped than the one which I have selected to compare with it—the noble towers of which are well known to be imitations and fair rivals of those of Laon. But it is in its surroundings that Limburg Cathedral falls so far short of Bamberg. The architect alone can see that the streets of the former town are quite as quaintly planned and the forms of its houses as good, as those which made up the glorious foreground in the two pictures I have above referred to. Of every atom of their ancient detail, however, a clean sweep has been made, and whitewash, yellow dab, or a cloak of slating, has replaced the richly wrought wooden framings, carved brackets, and other features, which still delight the eye in that and other of the cities of the more eastern and southern parts of Germany.

On the present occasion, however, my remarks should be confined to the interior of this Cathedral of Limburg, as explanatory of the very accurate view which they have to accompany; but the impression of the contrast between the outer aspects of the two places had been so recently received, that I could not lose this opportunity of expressing the feelings it aroused. There is, however, sufficient scope for their indulgence provided by similar incongruities visible without quitting the view of the interior, which is given in the engraving of the BUILDING NEWS for this week. This, from its size and clearness, is exceedingly valuable, and it is an excellent example of the advantages which can be conferred upon the profession by its means, through the aid of photography.

I fear, however, that the professors of this cognate art will hardly be kind enough to supply such material at their own costs and charges very much longer, for they certainly receive little encouragement at the hands of either the profession or the public. The view in question is an admirable rendering of one of those issued by the Architectural Photographic Society for the last season, and the difficulties which had to be surmounted in order to procure it would not be readily credited by anyone who had not the same opportunities as myself of knowing what they were, and at what cost and by what patience they were surmounted. In the very able criticisms in the BUILDING NEWS upon those photographs, regrets were expressed at the non-multiplication of the views of this particular building, and this advice in the interests of the society was undoubtedly correct; but, seeing that, as I happen to know, the whole of the combined subscriptions of the society would not cover the cost of the negative of that photograph alone, I am afraid it has little chance of being followed, the fault of which will not lie at the doors of Messrs. Cundall and Fleming, the enterprizing photographers to the society.

Perhaps, as I have now the opportunity, not often enjoyed, of answering the questions put from the pulpit of criticism, I may refer to the following statement made in the article I have referred to:—"In fact, this is just one of those examples which ought to have been photographed from every available standpoint—east, west, north, or south," and to say that, to the best of my belief, this was done. A view was given of the west front, which was obtained at very great personal risk to Mr. Fleming and myself, by hoisting the camera on to the top of a narrow wall overhanging a precipice, with one of its legs propped upon a tombstone, and amidst a gale of wind, and the position of my companion during the operation was so critical that I could not breathe freely till it was done. We then jointly searched the neighbourhood for a second standpoint within half a mile in vain, none being practicable without the aid of a balloon, as the cathedral stands on the brink of a precipice on three sides, and has buildings adjoining it on the fourth.



PLAN OF LIMBURG CATHEDRAL.

However uninteresting these details may be, I feel called upon to give them, as I find the difficulties in the way of photographers not at all appreciated. One is asked continually by professional men, who ought to know better, why views were not taken which would entail such trifles as removing houses, cutting down trees, or erecting scaffolds, and one feels rather inclined to suggest that for once they should try to carry out some of their hasty suggestions. *Mais revenir à nos moutons.*

In the view the spectator is looking from the western organ gallery towards the chancel, and in the foreground is one of the compound bays of the sex-partitely vaulted nave, with its four vertical divisions foreshadowing the arrangement so common in the Gothic of the Isle de France, and the peculiarly German Romanesque feature of the lower arcade opening to the aisle, plain even to baldness, having square unmoulded archivolts. A glance at the similar feature in the chancel shows the simply moulded impost, which, with a corresponding plinth, are the only decorative members of the square piers, irrespective of the vaulting shaft. The detail of the aisles is, as in most German churches, as plain or bald as the nave piers, being divided into square compartments, one corresponding to each half of the compound bay of the nave, divided by semicircular transverse arches on ¾-cylindrical columns, and the vaultings are domical with unribbed semicircular groins. The *Mannerchor (Mannshaus)* is the first storey over the aisles, forming a spacious gallery, and, as is usual in early German churches, is the finest feature, to which the lower arcades have been sacrificed, for it is obvious that, had they been lofty and elegantly proportioned, this gallery would have been thrust so much higher as to have been practically useless, whereas its object was to provide accommodation for the males of the congregation, their better halves being seated below. The openings to this gallery consist of couplets of pointed arches, with large rolls and edge mouldings to the archivolts, comprised beneath similarly moulded relieving arches; the bearing shafts are detached, with well and simply carved capitals and deep and bold abaci, the mouldings of which are continued round the intermediate piers and vaulting shafts, and form a strongly marked stringcourse at the level of the arch-springing line. The effect of this *Mannerchor* is sadly injured by a detestable modern rococo balustrade, which it is devoutly to be hoped may soon be removed. It does not appear that there was originally any parapet in this example, other than possibly a moveable one placed behind the columns, or, as in the triforium of Westminster Abbey, it may have been left unguarded. Sometimes, however, very excellent examples of parapets are to be found, as in the church of Notre Dame at Coblentz. Above this gallery is a blind passage in the thickness of the wall, open to the interior by an arcade of four arches to each half of the compound bays—these have similar bold detail to the arcade below, with high double plinths: above this passage is a single plain semicircular-headed clerestory window under each pocket of the vaulting.

The material of the bearing shafts in the *Mannerchor* of the chancel is black marble, and of the rest a delicate rose-coloured stone, and the effect of these is very charming. The shortness of the nave to such a church is quite remarkable. It consists but of two sexpartite bays, eastward of the compartments between the western towers, which is open to the nave, and through which the gallery is continued. The vaulting shafts to the main pier and responds (of which that next to the crux arch is seen in the view) run from the floor to the springing without interruption by the strings or bands; the intermediate vaulting shafts, and those to the chancel, have the stringcourses carried round them as bands. A curious feature is the small bundle of shafts which form the lower—the stilted part of the ribs, and which rest upon the carved capital of the vaulting shaft, the abacus of which is brought to a point to receive the small shaft of the central rib. The crux piers are simple and bold square piers, with ¾ shafts in face of each, and nook shafts, the latter running up (as might well be dispensed with) and losing themselves in an inane sort of way under the pendentives of the central lantern. The pendentives, in themselves, with two archivolts carried on small angular corbels, the space under being treated like the head of a niche, would be well enough but for some barbarous modern paintings which disfigure them.

The horrible glass in the easternmost clerestory window is another blot upon the interior, while the pavement, altar, choir grilles, stalls, pulpit, and throne, together with the gallery balustrades above-mentioned, are foils to the dignified and simple architecture of the building. The graceful Gothic canopy of the sacrament-haus in the foreground on the left hand is, however, the sort of foil one would desire as a set off to these Romanesque and Early Gothic churches. The vile jumble of rococo scrolls, gilt suns, and sprawling cherubs beyond should be swept out and made a bonfire of with the utmost expedition, as of course all architects would allow. But the public still echo the ridiculous laudation of the trumpery pulpits of Belgium, and I doubt not that many of your subscribers will only regret the friendly shadow which obscures the atrocious detail of these monstrosities. Leaving them, therefore, to the pleasures of imagination, I must conclude this description.

JOHN P. SEDDON.

[By an error of the lithographer, the illustration is said to represent the west end of the cathedral. As will be at once seen, the view is taken looking east towards the chancel.]

Dante's house at Florence is reported as being in the most filthy condition. It is gutted of its contents, and the windows are broken and unglazed, owing to the obstinacy of the proprietor, who, like the owner of the less famous houses in Stamford-street, will neither sell, let, nor repair the building.

SANITARY CONDITION OF THE WHITECHAPEL DISTRICT.

One of the most valuable improvements effected in this district since the formation of the Local Board is a constant supply of water to the poor. There are now fifty-three places supplied with water direct from the main by water-waste-preventers, and by means of these appliances the inhabitants can obtain pure water at any time in sufficient quantities for all household purposes. While the people are benefited the water companies are not injured, for Mr. Liddle, the medical officer, in his report for 1867, just issued, states his belief that less water is required to be delivered under the new system than under the old plan of the standing tap. The poorer parts of the district, which were a few years back in a disgraceful condition there being then upwards of seventy courts supplied on the intermittent system, are now as well provided for as any other London district. The dwelling-houses of the poor are still in a very unsatisfactory state. In many of them the tenants have to descend two and three flights of stairs into the cellars to deposit ashes and refuse, and to obtain water. In some cases, owing to the total want of any public control, the landlords have done away with the passage through the cellars into the back yards; and, instead of converting the lower room into a passage, have made a door in it leading thither, so that all the tenants of the upper parts of the house have to pass through this room to reach the yard. The cellars of some of the houses are less than 5ft. in height, and only to be reached by step ladders. Damp, and badly paved, in many cases not paved at all, as they are, landlords permit them to be inhabited. Thirteen of these cellars and sixty-five houses have been closed during the past year by the sanitary officers, as unfit for human habitation. From such a state of things as this, disease and pauperism are inseparable, and to it is owing in no slight degree the periodical returns of destitution now witnessed in East London. The Local Board and their officers seem to engage vigorously in their work, and a thorough house to house visitation is kept up, but additional compulsory powers are greatly needed. Take, for instance, the New Metropolitan Buildings and Management Bill brought into the House of Commons last session by Mr. Tite and Col. Hogg. Should this bill become law, all existing Building Acts will be by it repealed. "Under the existing law," says Mr. Liddle in his report, "houses can be enlarged by what is called a 'lean to,' although it may so prevent the due entrance of light and air as to render them unhealthy. The evils of the present mode of crowding together dwelling-houses will greatly increase, unless prevented by stringent powers in the new Building Act." Among 254 clauses in the bill there is not one that regulates the proper construction of either privies, water-closets, or ash pits. The act, also, very imperfectly provides for the ventilation of houses, and sanctions their being built back-to-back. This needs looking to. If the proposed law does not prohibit the future erection of unhealthy dwellings, it will benefit the public very little by abolishing existing nuisances.

GLASGOW ARCHITECTURAL SOCIETY.

THE CITY IMPROVEMENT SCHEME.

At the last meeting of the Glasgow Architectural Society, the City Improvement Scheme was under discussion—Mr. John Honeyman presiding.

Mr. Thomson read a paper on the subject, of which the following is a summary:—It is clear that, except in the great thoroughfares, the rate of rent which may be drawn from shops and warehouses depends very much upon the amount of population in a locality, and of course the value of property depends upon the rent. In the most densely populated area in the plan, the superficial space of ground set down to each inhabitant is about three and a half square yards. I have made a diagram showing an area of 352,440 square yards, including surrounding streets, upon which may be accommodated very considerably within the requirements of the New Police Act a population of 10,224—that is, about 3·63 square yards to each inhabitant—only a small fraction more than in the worst locality. I make it up thus:—There is space in the plan for 112 tenements; those towards the surrounding streets contain 124 shops and 2272 apartments, which in the lower localities mean houses. These apartments are each over 10ft. square; and, allowing 9ft. for the height of ceiling, gives over 900 cubic feet, which by the Police Act provides space for three adults; or, taking children in account, about 4½ individuals. It will be seen that the plan shows a block of ground 1068ft. by 330, having streets for general traffic surrounding it, and subdivided by narrow streets for local traffic only. Keeping in view the statement made by Mr. Stevenson, that the way to secure motion in the air is to make the open spaces unequal, I have shown a leading street 80ft. wide on one side, 60ft. on the other, and two cross streets 50ft. wide each, whilst the subdivisions or streets are each 32ft. wide in the middle and 16ft. at each end. The main feature of the plan is that the spaces are all open at the ends. There is, instead of a continuous line of building towards the leading street, a series of detached tenements of 48ft. in length with 16ft. spaces between. These lead alternately into streets covered overhead with glass, and lanes providing access to coal and dustcarts. Glasgow is notorious for the mortality amongst children. These covered streets are intended chiefly as playgrounds for the young, where they may run about under shelter and out of danger from carts and other vehicles. But the warmth which would result from this method of building would be conducive to the health and comfort of all. As to the expense, I propose to build the walls of these roofed streets of nine-inch brickwork, the difference between which and our ordinary stone walls would be more than sufficient to provide for the glass roofs; and, as each apartment could be ventilated by flues carried up in the gables beside the smoke flues, no harm could arise from the spread of contagious disease.

After some discussion, in which the plan was favourably spoken of, it was agreed to remit the whole matter to a committee for consideration, and to prepare a memorial to be submitted to the Commissioners under the Improvement Act—the committee to report to a special meeting of the society.

BUILDING AND LAND SOCIETIES.

The directors of the London and Provincial Benefit Building Society, in their report presented to the fourth annual meeting last week, record the satisfactory progress of the society's affairs. The withdrawals have been large, though not so large by £500 as in 1866. The advances amounted to £1,446 2s. 2d. By the resumption of advances the contingent fund has benefited, and there is now to the credit of that fund a balance of £114 15s. 9d. The retiring directors, Messrs. Caiger, Lawton, and Payne, were re-elected.

The annual report of the Middlesborough and Cleveland District Permanent Building Society, which has just been published, states that upwards of £52,000 have been advanced on improved mortgage during the three years of the society's existence. After writing off the interest due to investors at 7 per cent., and all other charges, and carrying a further sum of £300 to a reserve fund, there will be a balance of £2,666 19s. 9d. for future division. The shareholders now number nearly 1,000, and altogether the progress of the society has been exceedingly rapid and satisfactory.

WATER SUPPLY AND SANITARY MATTERS.

The Sewage of Glasgow.—At the usual meeting of the Association for the Consideration of the Sewage Question at Glasgow, Mr. James Robertson read a paper giving details in reference to a scheme which he proposed for the purification of the Clyde, and the improved sanitary condition of the city. One feature of the scheme was the introduction of an independent system of piping to be used in connection with the water-closets in the city only, while the present system of sewers would be employed for the purpose of carrying off the surface water, the refuse of public works, &c. Mr. Robertson claimed for his scheme that it might be carried out with greater ease than the plans suggested by others, while he had no doubt that from its adoption a considerable revenue would accrue. He estimated the cost of the various works, barges, and the necessary appliances at £400,000, the interest of which would be £20,000 per annum, and the annual cost of carriage, &c., at £13,000, so that the annual expense altogether would be £33,000.

Mr. Filliter, C.E., of Leeds, has prepared a scheme, at the instance of the local board of Castleford, by which every house would be provided with an abundant supply of water for £7,000, and an annual charge for working expenses of little more than £100. Some of the owners and ratepayers, however, thought that so large an expenditure was not necessary, and at a recent meeting the local board was recommended to advertise for schemes.

The Duke of Devonshire, who owns extensive mill property near Keighley, has withdrawn his opposition to the bill of the Bradford Corporation, on receiving an assurance that all reasonable protection shall be afforded to the interests of his Grace and his tenants.

The Chatham Local Board of Health have decided to purchase twenty acres of land, adjoining the Maidstone-road, for the formation of a new cemetery.

SCHOOLS OF ART.

The Second Grade Examination in Model and Perspective Drawing, in connection with the Newcastle School of Art, has just been held. About 65 pupils took papers for model drawing, and 17 for perspective, and the students' performances were forwarded to the authorities at the South Kensington Museum, in the ordinary course.

The distribution of the prizes to the students of the Lambeth Schools of Art took place in the class-room, Miller's-lane, Kennington. The students who received silver medals were W. W. Ouless, and James Redfern; the bronze medallists were Ellen Miles, and Robert Stocks; and the winners of first and second prizes of the Sketching Club are respectively Ellen Miles, and William Symous. Mr. Edward Cresy delivered an address on Architectural Sculpture, referring for illustration to a collection of casts which, having been presented by him to the school, adorn its walls.

The new school of art at Canterbury, instituted by Mr. Thomas Sidney Cooper, and known as the Sidney Gallery, was opened to the public on Wednesday.

Building Intelligence.

CHURCHES AND CHAPELS.

Satisfactory progress is being made in the restoration of the church of St. Lawrence, Reading, and it is hoped that it will be re-opened by the middle of May. The church is said to rank nearly first in the county.

The little church of St. Thomas à Becket, Newton Tracey, Devon, has just been restored. It is a very ancient building, having been built by Sir William Tracey, in expiation of the murder of Thomas à Becket. The roof has been restored throughout, a small chancel aisle added, and the porch rebuilt. The church has also been re seated. Hamhill and red sandstone has been employed for the dressings, the old masonry being used in as far as possible. The whole of the works have been carried out by Mr. James Bale, of Bideford, from the drawings and instructions of Messrs. Gould and Son, of Barnstaple.

Messrs. Warner and Sons have been commissioned to supply a peal of six bells, at a cost of about £500, to the new church of St. Philip and St. James, Clifton.

The Bishop of Lichfield consecrated a new cemetery at Wednesbury last week. The cemetery comprises twelve acres of land, situated in a suitable spot outside the town, and was purchased for £5,400. Plans for the chapel, lodge, &c., were prepared by Messrs. Horton, of Wednesbury, and the work was entrusted to Messrs. Trow and Son. The chapel, which cost a little over £2,000, is built in the modified Early English style, and is surmounted in the centre by a stone-ornamented spire, about 50ft. high, springing octagonally from a square base. The edifice is built of red brick, relieved with blue, and Bath stone. A covered roadway runs through the centre, and this divides the Episcopal from the Nonconformist portion of the building.

A new pulpit has been erected in the church of St. Mary, Stoke Newington, by Messrs. Farmer, from the designs of Mr. Gilbert Scott. The pulpit is supported by columns of variously coloured marbles, and enriched with mosaic work and relievi. It completes the interior of one of Mr. Scott's best works.

The church of St. Thomas, at Stanhope, Durham, was re-opened last week by the Bishop of Ripon. The building dates from the thirteenth century. A new roof has been constructed, the high pitch of the ancient one being retained. The walls of both aisles have been taken down, and widened, and the church has been entirely re-seated. Mr. Ewan Christian was the architect, and Mr. G. Gradon, of Durham, the contractor.

A new Welsh Presbyterian chapel was opened on Sunday, at Prince's-road, Liverpool. The building is in the Gothic style, with a strong Early French bias in all the details. It is in the form of a T, and affords accommodation for 1100 persons. A tower and spire, at the north-east corner, rise to an altitude of 200ft. The chapel is built of grey tinted Yorkshire stone, with yellow sandstone dressings. Messrs. W. and G. Audsley, of Liverpool, were the architects.

The Earl of Limerick, Provincial Grand Master of the Order of Freemasons, has consented to lay the foundation-stone of the new nave of Bristol Cathedral. The same body propose completing the restoration of the lady chapel in St. Mary Redcliffe Church, Bristol, which will, it is said, when finished, be one of the most interesting examples of ecclesiastical architecture in England.

A very fine new reredos is in course of erection in Worcester Cathedral, at the cost of the Dean, as a memorial of the late Mrs. Peel. The expense is £1,500. It is mainly constructed of beautifully veined alabaster, designed by Mr. Gilbert Scott, in the Early English style. The reredos consists of a centre and two wings. From the foot pace rises a plain wall with a moulded base to a height of four feet, where it finishes. Above this are five trefoil-headed niches, divided by shafts of polished marble, with carved capitals supporting the richly-moulded arches, above which are lofty gables, having an elaborately-carved cresting, instead of the more usual crockets, and terminating in ornamental finials. Around the arches are spherical inlays of lapis lazuli, and in the spandrels are sculpture heads of the apostles, surrounded by mosaic. The central niche is considerably larger and loftier than the others, and has additional shafts of polished red granite, spirally banded with gold, the finial being of great size, and ornamented with large inlays of lapis-lazuli and cornelian. A band of rich gold and marble mosaic extends round the arch, and the spandrel above contains a cross formed of malachite, red and black marbles, and spar. In the centre is a seated statue of Our Lord, crowned, and in the act of benediction. The Evangelists, SS. Matthew, Mark, John, and Luke, occupy the side niches. From the upper part of the central gable rises a lofty canopy supported on four shafts of verd antique, from the capitals of which spring arches and gablets, the whole being surmounted by an elaborate pinnacle, terminating in a cross, enriched with coloured marbles, at a height of 24ft. above the sanctuary floor.

A memorial church dedicated to St. Stephen the Martyr has been erected at Delhi. The style of architecture is Lombardo-Gothic. A peculiarity is that the altar is placed at the west end in order to admit of the main entrance, which is in the east, being open to the native heathen. A narthex, or unconsecrated outer court, is formed by a small portion divided from the body of the church by pillars.

The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, held its usual monthly meeting at No. 7, Whitehall, on Monday, the Rev. Robert Tritton in the chair; there were also present the Rev. A. Borradaile, Canon Nepean, Canon Jennings, Messrs. John Boodle, George Cowburn, J. F. France, Edward Hussey, William Rivington, Edward Thornton, and Rev. George Ainslie, M.A., secretary. Grants of money amounting to £810 were made in aid of the following objects:—Buildings new churches at Frosterley, in the parish of Stanhope, near Darlington; Hereford, St. James's; St. John's, in the parish of St. George's-in-the-East; and Westgate, in the parish of Weardale, near Darlington; rebuilding the church at Ellesmere Port, near Chester; enlarging or otherwise increasing the accommodation in the churches at Breinton, near Hereford; Crowmarsh, near Wallingford, Oxon; Christ Church, Frome, Somerset; Harroldstone West, near Haverfordwest; Minster Lovell, near Witney, Oxon; Stoke Ash, near Eye, Suffolk; Wendover, near Tring; and Wildford, near Ware, Herts. The grant formerly made towards building a church at Blackheath, in the parish of Hales-Owen, near Birmingham, was increased. The society likewise accepted the trust of sums of money as repair funds for the churches of Aldwark, near Easingwold, York; Baguley, St. John, near Manchester; Birkenhead, St Peter; Cheltenham, St. Peter; and New Ferry, St. Mark, near Birkenhead. This was the last meeting in the society's financial year, and during the last twelve months it has aided in building 32 new churches, rebuilding 23, and enlarging and restoring 72 churches, at an outlay of £6,760, but, owing to the limited funds at the society's disposal, the grants have been much smaller than the committee could have wished, in some instances barely sufficient to remunerate the applicants for the expense and trouble of complying with its very reasonable and just requirements. His Grace the President has appointed Tuesday, April 28, for a public meeting of the society, at Willis's rooms. The Archbishop will take the chair at three p.m. precisely.

A new Roman Catholic chapel was opened at Mossend, near Motherwell, N.B., on Sunday last. The building will seat 500 persons, and is of a very plain description.

BUILDINGS.

A block of buildings intended to provide improved accommodation for respectable artizans and their families on the flat system has been erected at Reading, by Mr. J. H. Blagrave. It contains four shops on the ground-floor, and twelve residences above. Each house has a separate front door and is entirely separate from the rest. The larger sets contain a living room, two bed-rooms, scullery, pantry, coal store, &c. The smaller have only one bed-room. The various residences are reached by stone staircases, communicating with open stone balconies. The rentals vary from 3s. to 5s. per week. The materials employed are white brick with stone dressings. Messrs. W. & J. T. Brown were the architects, and the contract was taken by Mr. Barnicoat at £2,350.

Mr. H. H. Vale, F.R.I.B.A, at a meeting of the Liverpool Architectural Society, recently exhibited a design for a house which he was constructing in the South of England, without chimneys. The flues were carried downwards into a tunnel which conveyed the smoke to a shaft in a tower eighty or one hundred feet high. He remarked that he did not altogether approve of the idea, but clients would sometimes have their own way. As a rule, architects, Mr. Vale thought, would be sorry to dispense with chimneys.

The work connected with the erection of the new Masonic Hall, at Halifax, was commenced on Monday. The contractor is Mr. Charnock, of Halifax, the work having been let for £3,500. The hall will be 64ft. by 55ft., and will contain a spacious room in the Corinthian style of architecture. There also will be a club-room, banquetting hall, &c., and accommodation for the hall-keeper.

We understand that the erection of the new buildings of the Charterhouse, at Godalming, has been placed in the hands of Mr. P. Hardwick, who has completed his plans, and will immediately submit them to the Governors for approval.

The corner-stone of a new Roman Catholic school at Masborough was laid on Tuesday last. The style of architecture is simple Gothic, the walls being of brick with stone dressings. The cost of the building will be £900. Messrs. Hadfield and Son, of Sheffield, are the architects, and Mr. Ripley, of Masborough, the contractor.

The new pier and sea-wall have been commenced at Saltburn, the former to extend 1,500ft. into the sea, so that passengers may be landed at the lowest possible tide. An extensive sea-wall, fitted for a promenade, is also being carried along the foot of the cliff, under the personal superintendence of Mr. Barry, one of the contractors for the stone work. Mr. John Anderson is the contractor for the new pier, which is to be composed of wood and cast-iron.

Mr. W. H. Wyatt, chairman of the Board of Guardians of St. Pancras, has just issued his report for the last nine months, in which he says that they have purchased three and a-half acres of land at Highgate on which they are to erect a hospital. He says:—"Thanks to the precise and positive instructions given, the cost of the building is estimated at £60 per patient, a result which cannot fail to be highly satisfactory. The Board have also selected a most eligible site of thirty-seven acres at Leavesden, near Watford, for the erection of schools. The land was secured at little more than £1,000 per acre."

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—J. B.—R. L. B.—S. G. M.—C. C.—H. H. S.—T. R.—H. G.—E. W. J.—J. A. H.—C. B.—I. M. S.—A. F. P.—P. E. M.—W. W.—I. I. E.—A. P. W.—A. R. T. F.—A. W.—I. and F. G.—W. C.—H. J. P.—I. P. S.—G. I. P.—"Art Folia e," which first appeared in the BUILDING NEWS, is published separately at £2 2s.

I. R. B.—The articles on "Construction and Design" are not published in a separate form.

I. L., Inverness.—The drawing alluded to is copyright, and we cannot use it without the consent of the proprietors.

Correspondence.

PUGIN v. BARRY.

To the Editor of the BUILDING NEWS.

SIR,—"We owe it to the bounty of Providence that the completest depravity of the heart is often strangely united with the confusion of the mind." Can I be condemned for applying in a degree these words of Junius to Mr. Talbot Bury? Granting, for a moment, that the drawing of the throne from which Dr. Barry's frontispiece is photographed is, according to Mr. T. Bury's opinion, "wholly the work of Sir Charles Barry," still this cannot in any way alter the fact that Mr. Herbert actually saw my father prepare the original design. Instead, therefore, of disproving anything, Mr. T. Bury only confirms my alternative assertion that Sir Charles copied the design which Mr. Herbert saw my father make. To either conclusion Mr. T. Bury is perfectly welcome. When, however, he can explain away my father's visit of five days to Sir Charles Barry, for the purpose of "making-out in general drawings every portion of the designs for the House of Lords' fittings, including a new design for the throne," it will be quite time enough for him to dispute the authorship of the drawing photographed in Dr. Barry's pamphlet.

With regard to Mr. T. Bury's statement, that my father never used his initials separately, I have but to say that, on referring to my father's compositions and drawings, I find his initials introduced in eight or ten different ways—sometimes in the framework of the sketches, and sometimes in various portions of the compositions themselves—in fact, "dropped into all kinds of places," as Mr. Herbert, on his authority as an eye-witness, testifies to have been my father's habit. I regret that Mr. Talbot Bury should have formed a habit of a very different nature—that of giving opinions which generally prove to be utterly without foundation. I cannot imagine why, on the present occasion, without helping on the contest in any way whatever (and, certainly, after all his subterfuges and contradictions, without the remotest chance of being believed), he should rush hastily into print to record an opinion which is manifestly dictated by spleen, and written far more for the purpose of hitting me through my father, than of defending Sir Charles Barry. He has the insolence to give Mr. Herbert the lie, by implication, apparently for the ridiculous satisfaction of being thought an important personage in the matter; and, in the usual "confusion of his mind," is totally unconscious of the hollowness of his professed friendship for my father, on the one hand, and of the fatal blow he is giving to the pretensions of Sir Charles Barry, on the other. He commits three offences at once; and I may, therefore, be pardoned for suggesting that it would be more prudent, and far more to his credit, if, for the future, he would endeavour to "think it his duty" to hold his tongue, instead of hazarding groundless explanations, and presuming to throw doubt on the solemn declarations of a man like Mr. Herbert, my father's life-long friend.—I am, &c.,

E. WELBY PUGIN.

Ramsgate, March 17.

PUGIN v. BARRY.

Sir,—Surely, when it was sought to establish the identity of Pugin's hand in the throne drawing by a search thereon for his initials, the case espoused in his favour was sent begging. How Mr. Herbert could have overlooked the awkward and very plain fact that no man's work ever depended, for proof of its authorship, less upon a signature than did Pugin's, I cannot comprehend. Pugin's style and touch, which were invariably strikingly peculiar and unmistakeable, gave the fullest and only reliable signature his work could bear. Failing this all becomes doubtful, nor can I understand how any array of initials can explain the difficulty away. The drawing in question is as opposite in touch to that of Pugin as Daniel Maclise's is to that of Fra Beato. Pugin's handling was always deliciously delicate, clear, and flowing. That of the throne drawing is, on the contrary, emphatically square and heavy in touch, mechanical rather than artistic, with a mannerism of dotting for point in traceried and carved detail utterly foreign to the easy grace and lightness of Pugin's line. If I could believe that the little wormy wriggles from which Mr. Herbert evolves Pugin's initials his custom was to put them in monogram form) were intended for letters at all, I should be met by the difficulty arising from my belief that the manly frankness of Pugin's nature would not have permitted him to smuggle his initials into a House of Parliament drawing in the covert way suggested. Had Pugin broken through his custom of not signing his House of Parliament drawings, he would have done so openly and distinctly. However minute the scale, Pugin was always clear in his dainty touch, by which he could indicate a swish-tail lion within a circumference little bigger than a pin's head. If he had resolved to put his own initials on the drawing, and he chose the parapet of the throne for them, they would have been indicated in fifteen cut characters, which, with the naked eye, none could mistake.—I am, &c.,

J. R. Clayton.

311, Regent-street, London, March 18, 1868.

ORGANS.

Sir,—In reference to the letter of your correspondent "J. C. J.," I would briefly remark that, if I had read in any musical journal the opinion that architecture had very much declined in the present age, I should have considered that journal singularly well informed. As to the tone of an instrument, it must be purely a matter of taste. There is no absolute law of taste—no law by which you can say one is right and the other wrong, but there is the weight of universal or historical opinion. As far as the continent is concerned, Willis could not be spoken of in comparison with Schulze or Cavaillé, and, on a question of music, the world considers a German verdict of higher value than an English one. The favourable opinions your correspondent cites have only insular value, and would meet with no attention in Paris, Brussels, Berlin, Cologne, Dresden, Munich, Prague, Vienna. Mr. Lewes is spoken of as only a fair specimen of an English organ builder, but I would ask, where can you find such excellent work and finish in every detail as in his organs? As regards Willis, does your correspondent allude to the organ which was in the first Exhibition of '51, now in Winchester Cathedral, or to the one exhibited in '62, and lately in the Agricultural Hall—if not to either, to which specimen is my attention directed? If the winding of the organ is an essential point, where shall we find a successful specimen by Willis? There is an organ at Kingston lately erected, where a man and two boys were seen blowing, and six consecutive chords could not be produced on the full organ. If what is called good pipe metal be not essential to tone, why have artists of all ages worked from one-third tin and upwards? The diapasons of St. Paul's were much better than ordinary spotted metal, and I expect they are so still, as the Dean and Chapter took the precaution of keeping them under lock and key during the repairs. It would be impossible for anyone to defend Willis without preaching up common metal. It would be an insult to compare Willis with Schulze and Cavaille in reference to tone; Schulze would laugh at Willis's fine work, and Cavaille would do the same at his *harmonic flutes* and *reeds*, scarcely knowing what it all meant. Cavaillé's chief voicer, who was lately in England, on going into Lewes's workshop, expressed his surprise at the high finish of the workmanship he saw there. The greatest proof of the general excellence of Mr. Lewes's work is that he is daily drawing over to his side those who are really interested in the advancement of the art of organ building, and he obtains clients who are satisfied to pay advanced prices, knowing that they receive value for their money.—I am, &c.,

Warrington Taylor.

190, Euston-road.

Sir,—I have read with much interest the letters that have appeared in your impressions of the 6th and 13th inst. on Organs. It appears to me to be a subject deserving of much attention, in a point of view architectural as well as musical. In the design of a church, it is general for the architect to give much of his attention to the details of his building. I refer especially to such objects as the pulpit, reredos, font, and even benches, on which often much taste and talent is displayed, and yet the organ, which occupies most space, is scarcely thought of, if not wholly ignored. The most that the architect will undertake is to provide a chamber for its reception, which, in nine cases out of ten, is so constructed as to destroy the effect of the sound, or at best to absorb a large percentage of its volume. It is time we should have something better than the stop, chamfered and panelled deal case, and the single row of gilt or illuminated pipes (an expedient adopted to hide the heavy look of the metal as used in England). We might learn a lesson from our continental neighbours, and not let slip an opportunity of displaying our skill in wood work, and producing an object that would not only be beautiful in itself, but would materially assist in the general effect of our designs. With regard to the musical view of the question, your correspondent "J. C. J." can have but a slender acquaintance with Germany, for no one who has travelled much in that country will deny that much still remains for us to do before we can equal them in an art manufacture in which they have always excelled.—I am, &c.,

Robt. C. Edwards.

34, Albion-road, Hampstead, March 14, 1868.

MANCHESTER NEW TOWNHALL.

Sir,—The usual equivocal Report for which Messrs. Donaldson and Street are somewhat famed having now gained publicity, perhaps, before the final decision in this important competition is made, an abstract criticism of that report will not be considered intrusive. To condense the report into as concise a form as will be intelligible, it would seem to stand as follows:—"Nos. 6, 4, 7, 5, are the finest designs of the whole series, and, with regard to relative merit, may be considered to stand in the order in which we have placed them." This is in reference to them from an "architectural point of view—site, climate of the district, and the purposes for which the building is required." Now, to an ordinary human being, this would seem to point out No. 6 as the foremost man. Nothing of the kind. Messieurs the judges, in three luminous paragraphs, declare that, for "general arrangement of plan, light, and ventilation," the palm is due to No. 5. On this ground, and on this alone, in which the numbers stand, 5, 6, 4, 7, they "both concur in recommending the design No. 5 for adoption."

Again, in paragraph second, in which, as regards "general arrangement and simplicity of plan," No. 5 is considered best, how can it be reconciled to that part of the first paragraph in which, for the "general purposes for which the building is required," it is placed last on the list? The report concludes, as mentioned before, with recommending the adoption of design No. 5; but winds up with a magnificently broad hint to its author that it lacks dignity in its most important features, and requires additional study. As a non-competitor in this what must be considered most unfortunate competition, it is impossible to regard the report in the light of anything but a specimen of the most unprofessional indecision. The conclusion is especially condemnatory, and leaves the reader nought to infer, but that, for the comparatively trifling advantages of light and ventilat on alone, No. 5 is worthy of pre-eminence over its fellows. As the question of plan and elevation is awarded to No. 6, in the first paragraph, I will close these remarks with a suggestion that the final decision be delayed until the designs are publicly exhibited, and that a resolution be formed by the City Council to invite such members of the profession as are willing to forward their opinions for consideration, whence probably a clearer opinion of the respective merits of the designs may be obtained than we at present seem likely of obtaining.—I am, &c.,

W. S. O.

Sir,—Your correspondent "Mancunium," who, I presume, is an architect, might have strengthened his case by the use of a little more accuracy in his inferences from the Referees' Report. Where does he find the position assigned to "St. Valentine," as a work of art, to be the lowest? I read it fourth in the list of "eminent men" for whose competitive interests he is so concerned. And further, what authority has he for condemning "St. Valentine's" interior architecture? If he will re-examine the report, he will find the allusions are to the light air-courts upon which the corridors look, and not to the apartments of the building. If error this be, it is one, according to the report, shared in by most of the competitors. I strongly sympathise with "Mancunium's" desire to have a building of which the city of Manchester, and, for the matter of that, the whole country, may be proud, but I confess to more confidence in the likelihood of such a result from a skilful plan to begin with. One fact, and that a very important one, should not be overlooked—"St. Valentine" has the first place for economy of design, and this, in the present position of architectural practice, is no mean commendation. A great deal lies under this, and, from one point of view, it transcends all questions of design. As a rule, it lessens a man's chance of success in a competition to adhere very honestly to the sum placed at his disposal. How does this test of cost affect "No. 6," the advocacy of which is so ardently taken up by "Mancunium?" Under that head it has no special place assigned to it, and, most probably, had "St. Valentine" allowed himself the same latitude as that inferentially presumed to have been taken by "No. 6," his design would have held a superior place. Theoretical estimates are fallacious, it is true; but, if Messrs. Donaldson and Street's opinion in this matter be not entertained, I would refer your readers to the report of Mr. Gardiner, the official surveyor of the estimates of the recent Law Courts designs, where Mr. Waterhouse is credited with the first place in accuracy of estimate, the extremes of discrepancy among the competitors ranging from £600,000 to £1,500.

B.

CHAPEL ARCHITECTURE.

Sir,—Your recent remarks on Chapel Architecture perfectly accorded with my own experience and sentiments. In all parts of the kingdom I have found chapel architecture displaying the same distinguishing characteristics — offensive pretentiousness, combined with meanness of materials and construction. From the little "Bethel" in a back street, with its one compo apron front, to its most pretentious rival in a leading thoroughfare, possibly a "church of the Congregational Independents," bedizened with vulgar ornament (an architectural Jezebel enforcing notice, though exciting disgust), all, to the eye of taste, are equally bad. The very transparent and puerile trick of trying to make an open and undivided area appear as nave and aisles on the show front, seems a universal practice with chapel architects. What a vast amount of perverted ingenuity has been expended in accomplishing what is simply an embodied lie! The aping of church architecture in the matter of towers and spires, lately become so general, is a monstrous absurdity. Chapels frequently have no bell, and never more than one small tinkler, yet an enormous shell is erected, perhaps 150ft. high, to hold a kernel of, say, 12 inches diameter. The only respectable chapel I have ever seen was one built from the designs of the High Church architect, Mr. Butterfield, and I earnestly recommend all Dissenters, whatever their shibboleth, or distinctive appellation, for the future to pocket their prejudices, and solicit the good offices of the younger school of church architects, such as Burges, Brooks, Bodley, or E. W. Godwin, if they at all care to have in future buildings artistic feeling, and those still more important qualities without which no edifice is a fitting place of worship, namely, solid, sound construction, with unaffected, truthful treatment.

P. E. M.

PLUMBERS' WORK.

Sir,—Under the above heading, which appears in the Building News of the 6th inst., Mr. J. A. Bunker states in the paper he read before the Architectural Association, that a plumber who really understood his business should be able to cast

lead into sheets as thin as 4lb. to the foot superficial, which is not correct. It is an impossibility to cast lead so thin as that to be of an even thickness, the average size of mould (say) 16ft. long and 6ft. wide, the lightest weight per foot that can be guaranteed of an even thickness being 6lb. per foot. With respect to the mould he is pretty correct, but, as regard the pan, he is not correct, the pan being generally made of strong sheet copper or iron rivetted together, and left quite smooth inside (wood lined with sand is sometimes used in temporary casting shops) The pan has not a slit in the bottom, nor is it made to move along with rollers down the sides of the mould, but is acted upon by a long wood lever attached to the same with wheels and chairs. The mould is prepared with damp sharp sand by the wood strike (pretty correctly described by Mr. B.), a plumber being on each side of the mould to prepare the sand of about 2in. in thickness, which is then planed smooth with a light copper plane. When all is ready, the pan being nearly the same width of mould, and filled with lead from the copper, about one third more than the weight required for the sheet being in the pan, the pan is tilted over on to the mould by the lever, the men following the lead down with the strike. The surplus lead runs into another pan at the bottom of the mould, a hole being in the middle of the same; an iron cart on small wheels receives the surplus lead, which is taken back to the pot. The principal feature in casting lead is the proper temperature of the molten lead, when thrown into the mould, preparing the sand, and following the lead with the stroke, which is only got by practical experience. A plumber that knows how to cast lead is very rare indeed to be met with now. The remarks respecting laying lead are very practicable, and I would recommend in all cases in gutters 2in. drip, and never less than 1½in. fall in 10ft. With respect to joints to pipes, plumbers seldom (or never) use the blow-pipe, but the solder, plumbing strike, and wiper. The safest plan is certainly to have air pipes to soil pipes, care being taken that the outlet is some distance from any windows. The best plan for waste pipes is to lay a separate pipe for that purpose into a drain, and branch the pipes from cistern sinks, and baths into the same. Never allow a waste pipe to empty on to a roof, or into a sink, as an overflow may be the result in either case.—I remain, &c., MATTHEW HALL.

11, Bulstrode-mews, W.

Intercommunication.

QUESTIONS.

[772.]—GEOMETRICAL ELEVATION OF MOULDED CHAMFER.—Can any one inform me how to draw the

geometrical elevation of a moulded chamfer with stop, the stop to be plain, and at an angle of 45 deg. on each face?—PUPIL.

[773.]—PHOTOGRAPHS.—I see in the BUILDING NEWS of the 14th ult. an account of the exhibition, at a meeting of the Scottish Architectural Association, of some particularly fine photographs, one of the best of which was the Madonna di San Sisto, by Raphael. Can you, or any of your readers, inform me whether these photographs are private property, or whether they are anywhere on sale? and if they are on sale, where I should write for particulars of size, price, &c., as I wish very much to get a thoroughly good photograph of the Madonna di San Sisto, from the original painting at Dresden? Or, if these are not for sale, I should like to know the best place where such a photograph might be obtained, as well as where I can get the best photographs from Turner's original paintings and etchings.—INQUIRER.

[774.]—STRENGTH OF WROUGHT IRON GIRDERS.

—I should feel obliged if you or any of your readers would furnish me with a simple rule for calculating the strength of wrought iron girders formed of boiler plate and angle iron, as per sketch; also for a lattice girder, 40ft. in clear bearing, to carry 10 tons equally distributed.—J. WALKER.

[775.]—COMPETITIONS OF DRAWINGS FROM EXISTING BUILDINGS.—I should feel obliged by one of your readers (once a competitor) explaining the mode of procedure in a R. I. B. A. or other competition of drawings from existing buildings—a country church for instance. Is the parson's sanction to be first obtained for the purpose of taking the dimensions and sketches and necessary memoranda, &c.?—CONSTANT READER.

[776.]—LACQUERING.—Can you, or any of your readers, oblige by informing me if there is anything I can put in the lacquer, which is sold at chemists, so as to give the work a glossy appearance when finished?—JOHN LANDSKY

[777.]—ARCHED PRINCIPAL RAFTERS.—Perhaps some of your readers will oblige me by giving some information regarding roofs constructed with circular principal rafters of laminated deals.—A. M. M

REPLIES.

[744.]—HOLLOW BRICKS.—Full particulars about hollow bricks, and where to procure them, may be obtained at the offices of the Society for Improving the Condition of the Labouring Classes, No. 21, Exeter Hall. Mr. Chadwick considers that walls built of hollow bricks are much superior to those usually constructed either of stone or the standard brick.—BUILDING CLERK.

[747.]—REMOVING MATERIAL.—I beg to inform "C. W." that, if there is a clause to the contrary the contractor can do as he pleases about the removal of the material or plant. Frequently, however, there is an express clause inserted in the specification to the effect "that all plant and material upon the ground is the property" of the company, or of the party paying for the work. The reason of this is, that in measuring up large works a proportion is allowed for material upon the ground. Thus, in railway work, suppose a contractor has the iron girders upon the ground, although not fixed in position, yet in making out his monthly certificate he would be allowed a sum of money for them. Evidently, in this case, it would be direct fraud to remove them—L.

[753.]—STOCK BRICKS.—The question of your correspondent appears to me rather vague. Why should not bricks be made of any other size than what they usually are seems the drift of it; and why should 9in. by 4½in. by 3in. be what may be termed the standard size? The answer is, that many years ago it was illegal to manufacture bricks except that particular size, and, although the restriction has been removed, the custom continues.—TILER.

[760.]—QUANTITIES.—I think the new number of Weale's series, entitled *Quantities and Measurements*, by Mr. Alfred Charles Beaton, likely to prove useful to your correspondent. With respect to his second question, I should say "decidedly not." CONTRIBUTOR.

[763.]—FILTERING.—Line the bottom of the tank with fine gravel and sand. If you want the water very pure, use a layer of charcoal; but the disadvantage of this latter material is, that it is rather expensive, and also after a time requires renewal. It makes, however, a first-rate filter.—S. X.
